The Nation.

2234

NEW YORK, THURSDAY, JULY 4, 1907.

The Week.

Just at present a word of two letters overshadows all else in Republican politics. It is the word "If," and the rest of the sentence runs, "Roosevelt will consent to be a candidate again." The Republican League of Clubs has discovered, by means of a circular letter sent to more than three thousand organizations, that "Roosevelt sentiment still dominates in the State to a remarkable degree." First Assistant Postmaster-General Hitchcock returns from an inspection tour with the tidings: "The South is for Roosevelt"—referring, of course, to party caucuses and conventions, and not the regular election day. Senator Depew is for Roosevelt, which means a great deal; Gov. Cummins of Iowa is also an energetic boomer. But if the zeal of his outspoken supporters is impressive, the attitude of the President's opponents is, in a way, even more so. Every time they give reasons for wanting some one else, they repeat that if it had not been for Roosevelt's unwillingness to run again, they would never have thought of any other man. How pathetically they hang to that declination, how angrily they turn on any one who ventures to doubt the President's word regarding the unalterability of his intentions!

The refusal of the Pennsylvania Democratic Convention to adopt a resolution endorsing Bryan for the Presidential nomination next year, which expressed full agreement "with the beliefs and positions taken by our peerless leader," and characterized him as "the Jefferson and Jackson of the Democratic party today," is not the first sign of a disposition to leave the question of the next nomination open for the present. A year or so ago, when Mr. Bryan returned from abroad, there was almost a scramble to the Nebraskan's "band-wagon." That day was counted lost which did not see an endorsement by some gathering of Democrats, or at least a declaration by some prominent member of the party favorable to a third nomination. That phase has now passed. Democrats talk freely about other possibilities, and they are showing increasing reluctance to commit themselves in advance. It would be foolish to infer from this fact that Bryan's personal popularity, so remarkably sustained during all the years of defeat, has waned; or even that he will not be the next Presidential nominee. But it is plain that he will be able to count less on mere unthinking enthusiasm than seemed likely on the eve of his Madison Square Garden speech.

Gov. Cummins's recent Pittsburgh address on the tariff has not received the attention it merits. It proves conclusively that, despite the compromise of last summer, the "Iowa idea" is not dead; just as it also shows that at present that idea differs very little from the one that actuates the tariff revisionists in Massachusetts. Thus, Gov. Cummins's whole argument was for a revision of the present schedules, and for a radical revision at that. "It seems to me," he said, "that we have gone mad in our zeal for the seller, and have abandoned the buyer to the tender mercy of monopoly, combination, and greed." He emphatically dissented from the standpatter's maxim that the "higher the price, the higher is the statesmanship," and generally showed himself to be in a state of serious rebellion which demands the immediate attention of the Republican leaders. Even Oyster Bay should take note when the Governor denounces standpattism as a "miserable maxim filched from the language of the great American game," all the more as Gov. Cummins is a third-term man, and declares that in this he speaks for the West. As for the theory that we must not revise the tariff for fear of disturbing conditions and inviting bad times, the Governor has no patience with it. "For the honor of my country, I am not willing to admit that we are such senseless slaves of humor and passion that we cannot safely remedy a wrong clearly perceived and universally admitted."

Gov. Hughes would doubtless have desired to obtain men for the Public Service Commissions whose names would at once impress the public. This he has plainly not been able to do. Few of his appointees are known at all. Postmaster Willcox is, of course, but has never shown any special competence for the work to which he is now summoned. Messrs. Osborne and Keep, on the up-State Commission, carry much more visible weight. But of all the appointments, this at least may be said, that they are not political. The Governor has evidently taken no dictation from the bosses. He does not think of his Commission as the shadow of a great rock in a weary land for broken-down party workers. His selections being his own, they are to be presumed to be the best that he could make, under the circumstances. And there is sometimes an advantage in giving important office to men who have their reputations to make. A made reputation often means a lazy and indifferent official. To Gov. Hughes's untried appointees will certainly be given a fair chance to win renown. They will have an added spur to diligence in the knowledge that the Governor can remove them forthwith, if they are negligent or incompetent.

The much-discussed failure of New York city to secure bids for its $29,000,000 4 per cent. bonds, offered on Friday, is simply another proof of the extent to which demand on investment capital has lately outrun supply. The fall in British consols within a fortnight to a price very much lower than any reached in the Boer-war period, has been ascribed without hesitation to the same general cause; so has the decline in French Government 3 per cents, to the lowest price reached since it last applied to the money markets sixteen years ago. Bankers who usually subscribe to New York city's loans say, in explanation of their failure to take bonds last week, first that they are already "carrying" as many unsold new securities—chiefly railway issues—as they deem it judicious to hold on borrowed capital in an uncertain money market; second, that the savings banks, usually the best "retail" customers for such bonds, are receiving too tempting offers for loans in other legitimate directions to make them anxious to pay par, even for so unexceptionable a security as New York city's 4 per cents. But this is only stating in another way the general principle which we have just set forth. Under such circumstances, the question what is to change the situation, so that old prices can be obtained again for new securities, is asked with more or less anxiety. The only answer is that supply of investment capital is always increasing, and that it will inevitably overtake demand unless the requirements of finance and industry keep on expanding to an even larger volume. The growth of available capital, during the past two years, has been wholly unprecedented; yet, as we have seen, the increase in demand for it has grown faster yet. In such a process there must be a halt, and the fact that a six-months' halt has already been called on the Stock Exchange, with no serious consequences, is assurance that the same thing can happen with other users of capital.

The axiom that a body cannot be in two places at the same time has its obvious exception in the case of a body which is large enough to fill all space, and so be everywhere simultaneously. This truth might possibly account for

the ubiquity of John D. Rockefeller whenever the process servers are after him. The failure of the officers of the law actually to discover him is merely illustrative of another physical truth, namely, that the human eye and mind cannot grasp that which is too large, any more than that which is too small, unless distance adjusts the object of attention to something of normal dimensions. Mr. Rockefeller, like the Matterhorn and Notre Dame, requires a far perspective. That is why reporters in Chicago see him in the Pocantico Hills and observers in New York see him in Massachusetts. Why the head of the Standard Oil Company does not of his own will reveal himself to the passionate gaze of his pursuers until his own chosen time, is hard to tell. Possibly it is because evading a summons is the only form of matching his wits against his fellow men that is still open to him. "Pity a poor old man whom nobody will stand up against," he might almost plead. "When I want a rival establishment, I go and take it. When I want a politician, I buy him. Nobody bargains with me, nobody competes with me, nobody stirs my flagging faculties to action. The only active exercise I get is due to a marshal with a subpœna." And, as a matter of fact, after he has had his little run, Mr. Rockefeller usually turns up and asks to be served, and shakes the instrument of the law by the hand.

The minimum strength of the army has just been increased from 62,666 men to 68,951, exclusive of 5,208 Philippine Scouts, and the 574 men of the Porto Rico Regiment. This increase of 6,300 men is due to the carrying out of the new law enlarging the coast and field artillery, and organizing the latter as regiments. The maximum enlisted strength of the army remains, in the discretion of the President, 100,000 men, according to the reorganization law of 1901, which gave the Executive a right never before possessed—to increase or decrease the army within that limit, as he sees fit. The idea is to allow him to increase the various regiments to war strength in times of emergency without waiting for Congress to act. Prior to the war with Spain, the strength of the regular army was 28,500, including the West Point cadets and professors. The maximum strength of the cavalry was 6,611, of the artillery 4,313, of the infantry 14,025, while the engineers were credited with 617 men. To-day the cavalry is allowed 13,020, the artillery 24,566, and the infantry 25,649 soldiers, while the engineers comprise 1,294. This clearly shows how greatly, yet how quietly, the army has been enlarged. The percentage of increase of men and officers is even greater in the navy, and yet neither service is satisfied. The cavalry naturally feels hurt that it is now less important than the artillery, and so it goes; and the taxpayer foots the bill.

Major-Gen. Batschinski, who as commander of the Thirty-fifth Siberian Rifles, and later as brigadier-general, made an enviable name for himself in Manchuria, where he is still stationed, has recently given a remarkable interview to a correspondent of the *Frankfurter Zeitung*. Fourteen times under fire, he confesses that he never once in the whole war saw a Japanese within rifle range—not even at Sandepu, where he was wounded and left a third of his regiment dead upon the field, killed by unseen enemies. This is modern war, he explains, and he scouts the idea that especial training with the rifle is required of the soldier to-day. That lesson drawn from the Boer war Gen. Batschinski pronounces absolutely misleading. There never again will be careful aiming in any battle, he asserts; if the soldier gauges the distance, it is enough; only in unimportant skirmishes will he have the opportunity to aim with care. It is ridiculous to expect an excited man, who has been for days under fire, and who only lifts himself out of his trench for a second, to pick out an object and carefully utilize the sights of his rifle. It makes no difference, in Gen. Batschinski's opinion, whether the bullet strikes to right or left, so long as it does not go over the enemy's line. Most of his men generally put the butts of their guns under their arms, and held them much as the artillery would use mortars. But if this is true, what becomes of the demand for trained riflemen which is heard all over England and echoed and reëchoed by such men as Kipling, Lord Roberts, Balfour, and a host of others, and by their American imitators?

It is much to be regretted that the Ethical Code proposed to the Institute of Electrical Engineers for their adoption should have been rejected as unconstitutional. In this day, when so many temptations to make money by reckless or unscrupulous means are offered to professional men, it is highly important that they should be subject to rules which may be more promptly enforced than the law of the land. Doctors and lawyers already have such codes; and the new profession of electrical engineers made a praiseworthy attempt to surround the calling with safeguards, and keep out pretenders and quacks. For practical work in electrical engineering requires more than knowledge and skill: it calls for a high degree of honesty. The electrician's client is ordinarily completely in his power, even to a greater extent than the patient is at the mercy of the doctor. Most men know a little about medicine; but electricity is a complete mystery to the layman. The code drawn up by the committee of the Institute covered the ground admirably, dealing with the general principles which should guide the electrical engineer, his relations to his employer, customer, client, and the general public. It also carefully defined the titles "electrician," "electrical engineer," and "consulting electrical engineer." Another and successful attempt should be made to codify the ethics of this responsible and important profession.

At Bonn University, last week, Professor Burgess of Columbia concluded the final lecture of a series with what one newspaper calls "an impassioned plea for a German-American alliance." As a matter of fact, the speaker's words may only with difficulty be construed in such a sense. It should seem that Professor Burgess was only more than ordinarily effusive in making use of the forms of international courtesy proper to such occasions. At the same time, nations other than Germany or ourselves can hardly be blamed if they discern a certain arrogance of tone in the professor's reported exordium. "We in Germany and America belong to the great progressive nations. We possess a love of justice and the same sort of optimistic enterprise. We belong together." It is unquestionably true that the two nations, possibly because of the now generally recognized community of sentiments that inspires their chief magistrates, have of late been talking a good deal of optimism and equity. Germany's apologists declare that their country stands not for power, not even for progress or for liberty, but for "social justice." William II., mediating between class and class, and restraining the mighty to uplift the weak, is the parallel to our own official gospel. But Great Britain, for instance, might with reason demur to being excluded from the justice-loving nations, and even Russia might object to being denied a future of progress. And as for Germany and America belonging to each other because they are alike, sometimes the best chances for a fight arise when two parties meet who are equally optimistic and equally bent upon justice.

France, having arrived at a complete understanding with Japan, seems bent on establishing relations of close amity with other nations in the Orient. Just now she is said to be coquetting with Persia. Her purpose is all the more attainable because, unlike other European Powers, she can scarcely be suspected of cherishing hopes of political conquest. Her aspirations lie rather in the field of commerce and of civilization. The French code underlies the juristic

system of Japan, and there is no reason why it should not prove adaptable in Persia, which, like the Japan of a few decades ago, is now in a state of transition from absolutism to parliamentary government. Through the efforts of the Persian Ambassador at Paris, no less than a dozen French professors have been dispatched of late to take part in the reorganization of public instruction in the Shah's dominions, and a former tutor of one of M. Loubet's children is now the preceptor of the Persian Crown Prince. Let Germany, Russia, and Great Britain contend for markets and spheres, the patriot might argue, if France can be the bearer of Latin culture to the Asiatics.

At home the good ship Clemenceau has weathered another storm, and for some time to come should be sailing in smooth waters. Last Friday's vote of confidence in the Chamber, after a terrific debate lasting nine hours, showed no appreciable diminution in the Government majority. The Premier once more succeeded in convincing the country that in the disturbed Midi, as previously among the striking miners in the north and the unquiet syndicalists at Paris, he had made use of the strong arm of government only when necessary, and to the extent necessary. Quiet has followed the appearance of the troops in the south, just as it did in the coal regions and in the capital. Undoubtedly, Clemenceau's past record stands him in very good stead. In moments of crisis the very men against whom he sends out the soldiers cannot but feel that the step is not apostasy on the part of the former radical, but the move of a statesman acting under the pressure of unavoidable necessity. Once the crisis is over, they feel, concessions will come. The remarkable thing about the Clemenceau Ministry is that a succession of assaults on really vital questions should leave it unharmed, whereas former Ministries have often gone down on comparatively trivial issues. With a host of personal enemies and aspiring politicians against him, not without a rival in his own Cabinet, Clemenceau meets onslaught after onslaught, and triumphs.

An open but anonymous letter composed by five priests has been addressed to the Pope, and has excited some comment in Rome. They remind Pius X. of his first allocution, in which he called upon the bishops to aid him in ridding the Church of "sowers of tares, apostles of monstrous heresies, and rebels." The writers of the letter accept these epithets for themselves, but rejoin that the Vatican, by its reactionary attitude, has alienated the two great modern forces, science and democracy, which the progressive priests had hoped to win to the Church. Christianity, they say, has ceased to be a living force; it has become a cold tradition. The Church has always checked scientific research and popular liberty. She should bring herself into sympathy with popular ideals. She has pinned her belief to certain stereotyped doctrines, continues this letter, although the body of scholastic teaching is "but the result of the life of the fundamental dogmas of Christianity as humanity in the different stages of its development has lived them." It seems, indeed, as if the Catholic Church were in greater danger from internal than from external perils. Attacks from without have left her largely unmoved in the past. As a writer in the *Journal des Débats* points out, Catholicism is suffering from an inner fermentation, which is causing a fever among the faithful and the priests. It draws the former towards political Socialism, the latter towards a radical philosophy, and thus imperils both discipline and doctrine.

The resignation of the stoutest reactionary in the Russian Ministry, the comptroller of the Empire, Von Schwanebach, would have been a triumph for Premier Stolypin if it had occurred before the dissolution of the second Duma. Coming at the present moment, it has the anomalous appearance of an ambitious politician retiring from power in the very moment of his triumph. That the Minister who fought hardest for the dispersal of the Duma is seeking private life because he feels his task is done, is scarcely credible. Bureaucrats do not sing *Nunc Dimittis* except on a distinct hint from higher quarters; and even the most fatuous member of the Black Hundred will scarcely maintain that absolutism is absolutely safe and the revolution permanently disabled. It is equally hard to interpret Von Schwanebach's departure as an act of contrition on the part of the Czar for his recent betrayal of the cause of liberty, as of his own solemn promise. Vacillating as Nicholas II. must come to stand in the eye of the world, such an abrupt about-face within a few days is scarcely conceivable, even at Peterhof. The dismissal of the Imperial comptroller was probably intended to proclaim abroad the Autocrat's elevation above party and his determination to rule by his own lights for the welfare of his entire people. It amounts to saying: "After dispersing the Duma because it was bent upon the destruction of the throne and of Holy Russia, We have dismissed those councillors who would have Us violate the pledges We have extended to Our people and the Fundamental Laws that rest upon Our immutable will."

Serious as the situation would appear to be in Portugal, an absolute break between ruler and people, culminating in possible revolution or in the establishment of an unconstitutional régime, is scarcely to be looked for. It is for the interest of Great Britain, Portugal's historical ally and protector, and of those Mediterranean nations whom Great Britain has recently drawn into a chain of understandings and agreements with herself, to prevent any political upheaval endangering the stability of the delicately adjusted balance in the Mediterranean. Portugal is a more important factor in European politics than we are inclined to believe from its confined position on the western edge of the Iberian peninsula. It has over five million inhabitants and rules over 800,000 miles of dependent territory in Africa and Asia, with a population of more than 9,000,000. It is its African possessions that give the kingdom particular importance in international affairs. Portuguese East Africa lies between British and German territory; Portuguese West Africa is bounded on the north by German Kamerun. Neither Great Britain nor Germany has probably lost the taste for geographical expansion, and a revolution in Portugal might have far-reaching results in Africa. The departure of the Portuguese crown prince on a long visit to the African colonies is not improbably an attempt to rally patriotic sentiment to the side of the throne, even to the uniforming of the rowers of the royal barge after the manner of the crews "in the days of Vasco da Gama."

Better feeling between the United States and Japan should be promoted by an address adopted at a joint meeting in Tokio of seven chambers of commerce, to be sent to the principal chambers in America. After a calm review of the "unfortunate incidents" and abuses from which the Japanese have suffered in California, the address deprecates the ill-feeling thus awakened, and declares that it may impair the commercial prosperity of both the countries concerned. The coöperation of Americans is desired in eliminating the present causes of discord. These Japanese organizations have likewise addressed President Roosevelt, hoping that he may reach "a speedy and satisfactory solution of existing difficulties." Chambers of commerce may be of real service in diplomacy, in saying informally things that governments may not wish to express. We hope that the response of the American chambers will be prompt, cordial, and sincere. They must realize that our unfortunate conduct towards our Japanese friends is seriously endangering our whole trade with the East, as well as our friendship with its peoples. They have the rare opportunity of displaying at once magnanimity and good business sense.

POLITICAL PHRASE-MAKING.

"The Constitution," declared Senator Knox in his Yale address, "is not to perish at the hands of the impassioned phrase-maker." The making of this phrase against phrase-making has been hailed by the New York *Sun* as in itself the construction of a political platform; and it proceeds to elect Mr. Knox, and "half a dozen Presidents," upon it. Without any desire to interfere with the sport of electing Presidents prolepticall-y, we may yet venture a word on the part which phrases have always played, and apparently always will play, in politics.

Mr. Knox himself never would have been a Senator of the United States but for the potency of the phrase. He comes from the State of Pennsylvania, which has been made and kept Republican by the hollowest of phrases. "Protection to American Industry," "Preserving the Home Market," "Making the Foreigner Pay the Tax"—these are some of the question-begging and confusion-producing phrases with which Pennsylvanians have been beguiled. The process began early. Webster had not been long at Washington before he wrote about the Pennsylvanians' coming to the capital to pester Congress about the tariff. Those were Webster's free-trade days; and he saw clearly the way in which selfishness and scheming were masking themselves in the pretence of benefiting American workingmen, diversifying our industries, and contributing to national pride. Yet he perceived also the taking nature of the specious pleas which were offered to disguise greed. American protectionists have, in fact, been shrewd and lucky in their phrases. They have known how to clothe self-seeking in the fine garments of love of country, and to make a vast system of social demoralization and political corruption wear an altruistic appearance. Their phrases have deceived the people, enriched the beneficiaries of the tariff, and made the political fortunes of a Cameron and a Quay, as well as a Knox.

We are not grumbling about this, save in so far as the phrases of the protectionists have covered up delusion and fraud. Phrases of some kind we must have in politics. This is only another way of saying that political battles cannot be waged without battle-cries. The Constitution, as a mere document, inspires and excites no voter. Nor will any long statute of the Legislature or of Congress stir him. He craves some tangible political doctrine, some immediate and concrete issue, and these can be placed before him only in words. And words, to penetrate and stick, must be sharpened into epigrams, or given point in a phrase. Mr. Lecky, in his book on Irish leaders and orators, alludes to the power which resides in the man who can originate "watchwords of party." All political history is full of their triumphs.

Yet political phrase-makers who have failed strew the shores of political annals. It is not given to every public man to know what will "go." In those sorrowful days when Admiral Dewey thought he was a Presidential candidate, reporters asked him on what platform he would stand. He innocently replied, "Why any platform at all? Why not just say 'The Flag'?" This unlucky attempt to make a phrase serve in lieu of ideas, worthy of Birdofredum Sawin as it was, applied the finishing stroke to the Admiral's candidacy. He would probably give as much to-day to sponge all that from the record as Bryan would to have his "cross-of-gold" phrase obliterated. Lord North described a certain Government bill as "a good recipe to knock up an Administration"; and many a political phrase has had a similarly disastrous boomerang effect upon its maker.

On the main question, however, there can be little doubt. Political man shall not live by phrases alone, but he certainly cannot live entirely without them. The greatest of causes has to be stated in a way to be made intelligible to the masses of the people; and he who sets out to do that cannot avoid making phrases. If he have a high order of political genius, he may invent something that will come home to his fellow-citizens in a way to move and lead them as no abstract statement or generalized speech could possibly do. The French put a contemptuous shade into their word *phraseur*; yet no nation has more signally illustrated in its history the great power, whether for good or evil, of political phrases, than has France. The French Revolution might be described as born of catchwords; and when men to-day speak of the ideas of '93, they often mean merely the swollen but empty words of '93. Mirabeau early predicted the rise of Robespierre, because, as he said, "that man believes every word he speaks." Put an earnest or even fanatical man behind some ingratiating and plausible political phrases, and you may expect him to do almost anything.

Phrases are designed to appeal to the imagination of men, and it is still true, as Napoleon said, that the world is governed by imagination. Of course, that faculty may play tricks with us. Napoleon himself finally became, according to Talleyrand, "the dupe of his own imagination." But politicians and even statesmen are all the while making their bids for the popular imagination, and usually do so by means of phrases. An English public man will talk, if he knows his business, not about Magna Charta, but about "Three Acres and a Cow"; our shrewdest politician will waste no time prating about the Constitution, when he can ring the changes on "The Square Deal." It is useless to complain of phrase-making. We all do it, better or worse. But every honest man will see to it that real truth shall be embodied in the political phrases he employs; and will insist that fraudulent party epithets and claims be classed with false labels on goods.

EXEMPTING PRIVATE PROPERTY AT SEA.

Mr. Choate's strong speech on Friday last in favor of the exempting of all private property at sea in war-time seems to have been the most notable event thus far at the Hague Conference, and produced the impression that this proposition will be adopted before the Conference adjourns. This is much to be desired. By no means too many positive results from this peace gathering are now in sight. If a better name for it at present would seem to be a Conference for the Amelioration of War, the exemption of private property would be a long step forward, for it would do away with one of the most plausible excuses for piling up naval armaments. Every navy now has its commerce-destroyers, some avowedly so built, others constructed as fast armored cruisers; but both kinds for the purpose of paralleling the record of the Alabama, in capturing or sinking unarmed merchantmen in war-time.

An ignoble aim this, particularly in view of the suffering inflicted upon innocent persons whose entire fortunes may be invested in a legitimate cargo. Yet it is warmly defended upon the ground that the way to end a war is to make your enemy suffer as much as possible, or, as Capt. Mahan has put it, "to stop maritime transportation, the increase of the enemy's wealth by circulation." Capt. Mahan also defends the capture of private property on the ground that a country is no more entitled to receive supplies than is the beleaguered garrison of a city. No besieging Power, he says, would be so foolish as to let wagons filled with supplies of any kind, whether public or private, enter such a beleaguered city. It is not that a maritime Power wants to confiscate private property for its own use, but in order to "hamper, weaken, and finally defeat the enemy." This is, of course, higher ground than that originally taken. In the Napoleonic period the regular naval officers, as well as the privateersmen with whom the oceans swarmed, captured private property afloat for the great personal profits to be obtained. This licensed plundering became so nauseous that privateering ended before the middle of the nineteenth century, neither the Federal Government nor the Confederate, for instance, issuing letters-of-marque in 1861.

So far as Capt. Mahan's analogy with the beleaguered town is concerned, it

strikes us as somewhat forced. The abolition of the capture of private property at sea would not prevent the blockading of harbors, nor the prohibition of the importation of munitions of war. What it primarily aims at is the safeguarding of the American merchant vessel engaged in carrying a cargo from Shanghai to London during a war between France and the United States, or the taking of a load of English furniture into Portland, Me. It is absurd to think that driving such commerce off the seas would do much to hasten the end of the war. Certainly, all the depredations of the Alabama and her sister cruisers, had they been five times as great, could not in any way have affected the outcome of the Rebellion. But the truth is that Capt. Mahan, and Julian S. Corbett, who heartily endorses Capt. Mahan's position in the current *Nineteenth Century*, are not averse to war, but favor it, or believe in it as the final arbiter of international questions, and they are therefore not willing to have the power of navies weakened in this way. Others of their manner of thinking might oppose the abolition of the floating mine or the submarine on the same or similar grounds.

In England the difference of opinion is great. The Jingoes of the *Spectator* type are up in arms against the safeguarding of private property, and have eagerly seized upon the arguments outlined above to bolster up their own position, which is frankly, as the *Spectator* puts it, that "the interests of Britain, as the chief maritime Power of the world, would be seriously jeopardized by the abandonment of the right of capture." It is self-interest, therefore, which dictates their policy, and no consideration whatever for the advancement of peace or for the interests of the family of nations as a whole. Fortunately, there are more enlightened men at the head of the British Government, and there is every reason to suppose that Campbell-Bannerman and his entire Cabinet would loyally support their representatives at The Hague in adherence to Mr. Choate's proposal. That great jurist, the present Lord Chancellor of England, Lord Loreburn, more than two and one-half years ago gave to the London *Times* his reasons why he thought that Great Britain would profit by the exemption of private property at sea, and his arguments have not yet been successfully refuted. But he is, we believe, also in favor of the change on higher grounds. In Germany, and France too, the proposal meets with great favor. For instance, the Berlin *Tageblatt* asserts that any opposition to the principle comes only from a little group of navy-crazed men, and that the great bulk of the people desires its acceptance. Dr. Theodor Barth of Berlin recently gave similar testimony at the Mohonk Conference. The outlook, therefore, may well be considered favorable for action at The Hague.

For the United States, Mr. Choate was able to cite the numerous instances in which America has for years past proclaimed its support of the doctrine and also a Russian assertion that the success of the American principle would be a "crown of glory to modern diplomacy." He announced that President Roosevelt was so impressed with the importance of the question that he hoped for a vote on it by every nation at this Conference. This is most welcome intelligence; for such determination to succeed, backed by Mr. Choate's enthusiasm and ability, should go far to carry the day. A victory would truly mean a "crown of glory" for the American nation, as well as for diplomacy.

THE STILL AGED SENATE.

In the comments which have followed the death of Senator Morgan it has been often stated that the venerable Alabamian was a survival from a Senate that is no more. It has been easy to recall the other legislators of age and dignity who served with him in past years, but who no longer answer to the roll. Only two Congresses before the one which expired last March there were Platt and Hawley of Connecticut, Harris of Kansas, Hoar of Massachusetts, Cockrell and Vest of Missouri, and Bate of Tennessee, all of whom have since died or retired. Every one thought of the Senate as a body of men old in both years and experience. When Mr. Dooley observed that the election of Albert J. Beveridge at the age of eight reduced the Senate's average to ninety-three years he expressed the current impression of that body.

That younger men have been chosen to replace many leaders is a matter of course. One hears much of a "new type" of Senator which has come into prominence within a very few years. Senators like Burkett, Hemenway, La Follette, Frazier, and "Jeff" Davis are spoken of as if they were the first of their years ever to break into an assembly the motto of which had previously been "only Nestors need apply." Plainly, it is worth while to inquire how much the Senate really has changed in respect to the length of experience of its members. Mere age is manifestly not the criterion, for by the usages of the Senate itself an octogenarian is treated as a neophyte during his first term, while younger men who have had the chance to prove their qualities are heard with all respect. Let us, then, compare the present Senate with its predecessors in respect to the continuous service of its members.

To begin with, the dean of the present Senate, Mr. Allison, has served longer without interruption than any previous wearer of the toga. On this Independence Day he rounds out thirty-four years and four months of continuous service. Justin S. Morrill of Vermont died on December 28, 1898, with thirty-one years, nine months, and twenty-four days to his credit, while Thomas H. Benton, though he entitled his memoirs "Thirty Years in the United States Senate," was a member of the upper house only from August 10, 1821, to March 3, 1851, and really lacked more than four months of his thirty years.

In the nature of things, a service of thirty years must be altogether exceptional. Few men are young when chosen to the Senate; and even if the incumbent lives long enough, political conditions must be rather uncommonly stable if he is to enjoy five successive reëlections. But the twenty-year Senator is a more normal product, and there are few members so old when elected that they may not look forward to the possibility of ten years at Washington. When the first Congress convened in 1797, the entire membership was, of course, new. Ten years later, the Fifth Congress found only four of the original thirty-two Senators in their places. In the Tenth Congress there was no Senator who had served in the first, and only two who were in the fifth. In the Fifteenth Congress not only all the Senators from the Fifth Congress, but all except one of those from the Tenth Congress, had retired. So it is evident that the first three decades did practically nothing toward developing a Senate of veterans. When Daniel Webster came to the Senate in 1827, there was not one of the forty-eight Senators who had served more than twenty years, though an even ten had completed one decade.

Taking account of the Congresses at ten-year intervals only, Benton's is the first name which appears in the twenty-year column. This is in the Thirtieth Congress, in the year 1847. There is no other until more than ten years after the close of the war, when, in the Fiftieth Congress, the two Vermont Senators, Edmunds and Morrill, appear in the twenty-year class together.

The proportion of Senators of long service at each of these points may be shown by means of a table:

Congress:	Membership.	30 years.	20 years.	10 years.
1797 5th	32	0	0	4
1807 10th	34	0	0	2
1817 15th	42	0	0	1
1827 20th	48	0	0	10
1837 25th	52	0	0	6
1847 30th	60	0	1	9
1857 35th	66	0	0	17
1867 40th	66	0	0	9
1877 45th	76	0	0	12
1887 50th	76	0	2	16
1897 55th	90	1	6	22

Never in the days when there were giants in the Senate did it contain either relatively or absolutely so many veterans as it did ten years ago. In the Fifty-fifth Congress Morrill had served thirty years, Cockrell, Harris of Tennes-

see, Hoar, Morgan, Allison, and Jones of Nevada, more than twenty, while Aldrich, Bate, Daniel, Davis, Faulkner, George, Gorman, Gray, Hale, Hawley, Pasco, Quay, Stewart, Turpie, Berry, Cullom, Frye, Walthall, Jones of Arkansas, Platt of Connecticut, Teller, and Vest had taken their seats more than ten years previously.

Remarkable as this list appears, and striking as the changes since that day appear, the Senate, if it were called in special session to-morrow, would make an equally good showing. Allison, as already stated, has more than thirty years of Senatorial work behind him, Hale, Frye, Aldrich, Cullom, Teller, and Daniel, more than twenty each, and Gallinger, Hansbrough, Proctor, Lodge, Perkins, Burrows, Clark of Wyoming, Bacon, Elkins, Martin, Nelson, Tillman, Warren, Wetmore, Clay, Foraker, McEnery, Penrose, Pettus, Platt, Mallory, and Money, more than ten each. The proportion is exactly the same as it was a decade ago, one of the ninety Senators having served for thirty years, six for twenty, and twenty-two for ten.

The important fact about the Senate's composition, then, is not that our States are electing to the upper house men a few years younger than was customary at earlier periods, but that once chosen, they are returning year after year as large a proportion as formerly, if not larger. Give a young Senator time enough and he will turn inevitably into an old Senator. Indeed, the comparative youth of some of the present "first-termers" gives the best reason for hoping that ten and twenty years hence the Senate will possess another group of ripe statesmen like those who entered it in the seventies.

SAVINGS-BANK INSURANCE.

Less than a year of agitation in Massachusetts secured the passage of an act which Gov. Guild signed last week permitting incorporated savings banks to establish life-insurance departments. A magazine article by Louis D. Brandeis was the first stimulus of the movement, which was carried to success chiefly by an efficient Massachusetts Savings Insurance League and an influential Committee of One Hundred.

The most effective argument for the new law was presented in the contrast between the 37.21 per cent. of premium receipts which went for expenses of management in the three companies writing the bulk of this country's industrial insurance, and the 1.47 per cent. of deposits spent on the management of the Massachusetts savings banks. Mr. Brandeis showed that a man who began on his twenty-first birthday to pay 50 cents a week to one of the industrial insurance companies, and deposited an equal sum in a savings bank, would, if he lived for the 40.25 years allotted him by the mortality tables, leave a bank-account of $2,265.90, as against only $320 of life insurance. As the Armstrong report showed, the excessive cost of industrial insurance was not due in any considerable degree to extravagant or dishonest management, but was unavoidable when agents were employed to solicit policies of a few hundred dollars and to collect dime and nickel premiums weekly from house to house. By permitting the savings banks to write insurance, the thrifty workingman could be saved all these items of expense, and at the same time entrust his premiums to institutions always notable for the honesty and economy of their management.

In establishing the new system the Legislature has taken pains to prevent the savings banks with their enlarged powers from following in the paths of some of the insurance concerns. Indeed, the amendments inserted after the original drafting of the bill appear to have been all in the nature of additional safeguards to the policyholder. The consent of the bank commissioner is necessary before any savings bank can establish an insurance department at all. The funds of the two departments are in all cases to be kept entirely separate. Insurance investments are limited to those now permitted for savings banks, except that loans may be made on policies. No solicitors or house-to-house collectors may be employed. Only residents of Massachusetts may be originally insured, and a list of outstanding policies is to be filed with the insurance commissioner every month. The savings bank's business is practically limited to the industrial form of insurance by a clause prohibiting it from writing policies binding it to pay more than $500 death benefit or more than a $200 annuity. The bank's license to issue policies is to be revokable by the commissioner on thirty days' notice, "provided not more than twenty thousand dollars of insurance on not less than one hundred lives . . . then remain outstanding." Finally, the expense guarantee fund—not less than $5,000 for each bank—and the insurance guarantee fund—not less than $20,000 for each bank—are entrusted to a newly created body, the General Insurance Guaranty Fund, seven trustees of which are appointed by the Governor, and which itself chooses the State actuary and State medical director.

Enough banks to give the project an adequate trial have already promised to avail themselves of the provisions of the act, and as one of its friends writes, "its success will depend wholly upon whether we sufficiently educate the community to avail itself of the opportunities afforded." The unknown factor in the situation is the amount of business which the new departments may expect, and this depends on factors which are partly psychological The workingman who wants to provide a few hundred dollars of death benefits hereafter has the choice of a variety of insurance enormously expensive, and another which should be extremely cheap. In the one case he must pay premiums for two or three years before the initial charges for writing his policy are paid; in the other these should be little more than would be entailed by opening and carrying a savings account. If two business houses in any other line competed on such terms, the result could not be long in doubt. Yet opposed to the advantages and economies of the savings bank is the axiom that human beings will not insure their lives voluntarily. People who could not sleep if their houses stood overnight without fire insurance have to be dragooned into insuring their lives. The man who applies for a life policy in the old-line companies is regarded with some suspicion, because the assumption is that if he were in sound health, he would wait for the agent to approach him. It is recognized by actuaries, we believe, that the life insurance company which merely opens an office and waits for business to come voluntarily secures in the long run an undesirable class of risks, unless it is exceptionally careful in selection.

The savings bank, however, is in a vastly more advantageous position than any independent insurance company. It is already in touch with the intelligent and provident working people. They now frequent its offices where hereafter deposits will be received at one window and insurance premiums at another. At least the depositor can hardly fail to have presented to him the argument that the two chief forms of modest savings investment can best be conducted on the same principles. Confessedly an experiment now, the insurance department of the savings bank has wonderful possibilities for usefulness, if only it can overcome by education the public's curious inertia in the matter of life insurance.

OPERATIC DIRECTORS.

What is known in foreign musical circles as the "Conried Peril" is agitating Austrian and German newspapers more than ever. The manager of the Metropolitan Opera House is making his usual summer tour of foreign cities, picking out the best singers and bribing them away with offers of what over there are considered "fabulous" emoluments. No German opera house has more than two or three first-class singers at any one time, and these are the very ones whom the affluent American is after. In Vienna, a few years ago, the best prima donna was Miss Edith Walker, and Mr. Conried took her away. Berlin had Miss

Farrar and Miss Destinn; Mr. Conried brought over Miss Farrar, and Miss Destinn is to follow soon. Munich had Ternina and Morena, Knote and Reiss; Conried has got them all, even Miss Morena, whom he has just engaged for three years. And so it goes in every city. However, the *Zeit* of Vienna declares triumphantly that "the European directors have made up their minds no longer to permit their best artists to be taken away from them. They will meet this summer for the purpose of forming a Trust against Conried, and, by the alteration of contracts, make it more difficult for European artists to accept an engagement across the ocean at whatever moment they choose."

We need, however, hardly worry over that Directors' Trust. Great artists, being scarce, can, like domestic servants, make their own terms and scout contracts. What aggravates the situation is that the terrible Conried is not only after the artists, but is seeking, with true New World effrontery, to entice away the very directors to serve under him as conductors. He tried to get Felix Mottl of Munich; failing this, he made overtures to Director Mahler of the Imperial Opera in Vienna; these two men being the most conspicuous operatic directors at present in Greater Germany. That Mottl refused his offer is not to be wondered at, for he is just now the most sought-after musician in Europe. German cities fairly fight for him.

For several weeks the newspapers of Munich and Vienna had a daily column on the Mottl question: Would the adored Felix remain in Munich or go to Vienna to replace Mahler? Four years ago he accepted the position of Generalmusikdirektor in Munich at the unprecedented figure of $9,000 a year. Being a Viennese by birth, he would have preferred to be called to his native city, but there was no opening there as long as Mahler remained at the head of affairs. Some months ago, however, there were persistent rumors that Mahler would resign. It was said that he wanted to devote all his time to composing (he is a prolific writer of interminable symphonies); that his tyrannical conduct (he is a great martinet, and makes all the singers submit to his will in every detail) had made it impossible for him to remain; that his pretended reforms had been found of merely ephemeral significance; and that he had accepted an offer from Conried to become the head conductor at the Metropolitan Opera House.

At a recent meeting of the Philharmonic Society in Vienna, 86 out of 94 members voted to have Mottl as their solo conductor for next season (even in case he remained in Munich). As Mahler received only four votes, it seemed as if matters were coming to a crisis. The secret leaked out that the operatic arbiters in Vienna began as long ago as last September to negotiate with Mottl. But Mottl's Munich contract tied him for ten years, and he could not without valid reason ask to be released. At the opportune moment came the cabal against him—practically an attempt to drive him out of the city, as Wagner and Hans von Bülow were driven out in their day. Mottl brought suit against a newspaper for libellous misrepresentation, and the result was a great personal triumph. On his reappearance at the Opera he received an ovation lasting a quarter of an hour. Still, it was deemed pardonable, under the circumstances, that he should lend a willing ear to the offer from Vienna and ask to be released from his engagement.

The contradictory reports in the newspapers were set at rest when the Prince Regent of Bavaria issued a communication in which he said: "The request of Generalmusikdirektor Mottl is based on personal grounds. Opposed to these, however, is the more important consideration of the musical and dramatic art of Munich, for which the departure of a leader of the extraordinary significance of Generalmusikdirektor Mottl would mean a great and scarcely reparable loss. This consideration forbids my granting his request after so short an incumbency of his position." So Mottl remains in Munich, with new recognition and promotion, while Mahler leaves Vienna, and now everybody is wondering who will be his successor, Richard Strauss and Weingartner being most frequently suggested. But Weingartner has had all the experience he wants in connection with opera houses, while Strauss has too advantageous a position in Berlin—one involving little work and allowing plenty of time for composition—to be likely to give it up.

Richard Wallaschek, the noted Viennese critic, asks with good reason why it should be assumed that the director of an opera house must necessarily be a conductor. He sees no more reason why he should be such than why a physician should be his own apothecary and undertaker, or a judge his own clerk. The ideal director is, in his opinion, a good deal like an ideal librarian, who should not be a scholarly specialist so much as a man conversant with the whole book world, and able to judge what, on diverse grounds, it is best for him to acquire. The main duties of a director are the choice of operas, new and old, for his repertory; the engagement of good singers (in this Mahler failed wofully); and travelling from city to city to study the situation and gather hints. Conductors and composers doing these things waste time that might be more profitably employed in their own specialty. Shall we conclude, then, that our own Heinrich Conried and Oscar Hammerstein come nearer the ideal of an operatic director than Mottl and Mahler, since they are neither conductors nor composers?

AUTHORS AND THEIR FOOD.

A symposium has been going on of late in the columns of a morning newspaper on the proper diet for men and women of letters. Strangely, for once, the members of the irritable fraternity seem to be displaying an amazing unanimity of opinion. The vast majority is for a regimen that is light to the point of being ethereal. Meat seldom makes its appearance; when it does, it blushes and feels out of place, like an eighteenth-century country bumpkin in an elegant eighteenth-century salon. The favorite breakfast dish is a glass of cold water; a good many would add thereto a banana or two, while the weakest spirits go so far as a small pitcher of milk and cream and one diaphanous slice of the bread that our mothers did not use to make. Lunch is about twice as heavy as breakfast, especially as far as the cold water is concerned. Dinner shows an array of courses; their number might almost stir the average reader to something like enthusiasm, if it were not for a general effect of unsubstantial Whistleresque monochrome.

Thin fare, indeed; and, a materialist would be inclined to say, capable of producing only an anæmic literature. But the writers themselves deny it. Never, so runs the general tenor, had they felt as well in nerves, in body, in mind, as these last two years when they have been subsisting only on whipped cream and whole wheat bread, and never had their pens travelled in such felicitous concourse with the rapid flow of blood in their tingling veins. That, presumably, is why we have such a fine, optimistic body of fiction, where the men are all masterful and straight, and the women are all gentle and fair, and all ends well. Seeing things from their cruel side, knocking one's head against the riddle of life, all this *Weltschmerz* that we hear so much of—we have all felt its crushing pain and found it was only indigestion. If Goethe had been acquainted with the nutritive qualities of Graham bread, "Werther" would not have preached mawkish sentimentality to generations of lovers. Senancour and Amiel should have lived more on the curdled milk of their own high latitudes. Much of the so-called Puritan austerity in Hawthorne may be interpreted in terms of doughnuts.

And yet great optimists ate and wrote. Balzac and his frequent surrender to Gargantuan prandiolatry; Scott, who made furtive excursions from his chamber in Wordsworth's house to the village inn, where mutton chops and ale gave him strength for continued so-

journ in a rare and high atmosphere; Browning, who was as smoothly rounded as any of your well-fed city traders and aldermen, up to the very king of them all, who, as a youth, showed such a finely cultivated taste for venison—there is authority enough for maintaining that genius shows itself also in its capacity for transforming gross matter into undying form. On the other hand, it is open to doubt whether the ascetic principle that animates the modern literary menu, does not really hamper and cripple the imagination. Spirituality on thin gruel is possible; but, verve, *élan*, on creamed potatoes and asparagus tips is hard to conceive, and even concentration is extremely difficult on a nagging stomach. And the moral travail! Invariably it is one-half of an orange, three quarters of a bowl of milk, ten spoonfuls of a plate of pea soup, the crust only of a slice of bread. The effort of will necessary to put away the other half of the orange, abstain from the remaining 25 per cent. of the milk, turn aside from the final half-dozen spoonfuls of soup, or crush the hankering for the delicious soft of the bread, must leave one too weak for literary work, or work of any other kind, or for any appreciation, in fact, of the joy of life.

The trouble is that our writers, being an imaginative and credulous folk, have been led away by the preachments of the scientific dietarians. Only the other day a congressful of them met in London and gave birth to a new crop of formulæ. Who knows not the typical dietetic confession of faith: "I believe, or I assent, that a small plate of porridge is equal in proteid value to two thick slices of a four-pound loaf of bread. I assert that an egg contains as much nutriment as a pound of sirloin steak; that two sandwiches of French bread with watercress are convertible into as many foot-pounds of energy as a good-sized Irish stew." If the men who promulgate such beliefs are not nature fakers, they are, to say the least, very poor practical scientists. The engineer would never risk a trainload of people on a bridge that was just theoretically strong enough. He multiplies its theoretical strength by five; and that is what the dietarians should do. If, instead of the theoretical unitary egg that equals a pound of meat in utility, they said five eggs, and instead of two watercress sandwiches, they said ten, much could be forgiven them.

As for the unanimous favor with which a thin vegetable diet is regarded by our literary workers, we cannot find a reason, unless it is that, being for the most part still unknown, they are all engaged in writing the same kind of salable stories, and are therefore, till success comes, unanimous—and vegetarians. When they have "arrived," they will differentiate and take to meat. A perpetually uniform diet for authors is inconceivable. We cannot think of Jack London as surviving very long without raw beefsteak and moonshine whiskey; Josephine Dodge Daskam surely lives on Pasteurized milk and lady-fingers; Richard Harding Davis on pâté de foie gras, washed down with extra dry, and Maurice Hewlett on venison pasties and October ale. We should not be surprised if some authors ate grape-fruit and toast before sending out their hero and heroine on their climb up the Matterhorn, and dined on lobster salad before writing the scene in which she rejects him. So every literary *genre* might have its own gustatory atmosphere. As the poet may have remarked:

Eggs is for Epics, where the brave meet the fair.
Lentils for Lyrics on Melisande's hair,
Nuts is for Nature books . . .

CHESTERFIELD.—II.

Lord Chesterfield's Letters are divided into two distinct collections, those to various correspondents on Political and Miscellaneous topics and those To his Son on Education. They are alike in the dry light, the almost pitiless clarity of intelligence which they throw upon all the affairs of life, but in other respects they are naturally diverse. One is impressed in the general collection by the shrewd understanding of men and movements which again and again predicts the shifting political combinations of the age. Nor did he fail to observe the larger currents of national destiny, as in his insight into the condition of France, the clearest expression of which occurs, however, in a letter to his son: "In short, all the symptoms which I have ever met with in history previous to great changes and revolutions in government, now exist and daily increase in France." With this insight goes an irresistible impulse to elucidate and advise; there is, in fact, just a touch of the schoolmaster, strangely compounded with the fine gentleman, in his inveterate didacticism—notable especially in the letters to his Irish friends. No one, not even Swift, ever understood Ireland better, or sympathized with her more heartily, than this British disciple of Rochefoucauld. He was constant in his support of the manufactures of paper and linen, by which he hoped the country could be brought to efficient independence. In his friendships generally, few but enduring, he maintains a kind of discreet enthusiasm, rising in the correspondence with one or two French ladies to a really exquisite gallantry. Was ever a prettier compliment turned than that by which he made his desire to conform his dates to those of Madame de Monconseil's letters the cause of reforming the British calendar? The whole letter (11 Avril, V. S., 1751) should be read in connection with that to his son a month earlier, to see with what refinement of address he turns the same notable act to the uses of pedagogy and courtesy. There is the proud self-effacement of the good teacher in the one, as of the courtly gentleman in the other: "Mais enfin voilà votre style établi ici. Voyez par là comment le public ignore presque toujours les véritables causes des évènements; car il ne vous soupçonne pas d'entrer pour quelque chose dans celui-ci."

But it is the long series of letters to his son that have made the name of Chesterfield to be a living symbol. No legitimate children were born to him, but while at The Hague he had formed a *liaison* with a certain Madame du Bouchet, governess in a wealthy Dutch family, who followed him to England and lived there quietly on an allowance during his life. In 1732, their son, Philip Stanhope, was born. Never was legitimate child trained and pushed in the world with such unwearied assiduity; in the care of this boy the father and the pedagogue combined in Chesterfield to produce an overpowering anxiety. He was educated under the best masters and then sent, with a "bear-leader," to the Continent for years to be ripened and *décrotté*. Parliament and diplomacy were both opened to him, but in the end, owing in part to the stigma of his birth and in part to an invincible clumsiness of manner, he was little better than a failure. In 1768 his death revealed the fact that he had been secretly married to a lady, who made profit of the connection by selling the Earl's treasured letters to her husband for £1,575. They were published in 1774, to the scandal of the family and of England.

In truth, few men dared at the time to defend these extraordinary documents. Horace Walpole was shocked by their naked candor. "A most proper book of laws," he calls them, "for the generation in which it is published; they have reduced the folly and worthlessness of the age to a regular system." But all the world read them, even though, like John Wesley, they were horrified at the picture of this cunning libertine "studiously instilling into the young man all the principles of debauchery, when he himself was between seventy and eighty years old." Dr. Johnson, with more vigor than justice, had already, in his terrible satire of the Patron, held Chesterfield up to contempt, and now he flung upon the author of the Letters a hideous phrase which no amount of palliation can ever quite obliterate. These things occurred toward the end of the century, when the age was in a somewhat repentant mood for its sins. Having become established in virtue, the world to-day can afford to be a little more lenient—and just. For really the manners taught by Lord Chesterfield were not those of a dancing master, nor the morals—what Dr. Johnson was permitted to call them. There is enough to excuse without any such distortion of the truth as this, and, to have done with the subject, we may admit that certain passages of the letters not only sin against the strict laws of virtue—indeed, the whole tenor of their instruction does that—but transgress the social code of the day. At times they drop to downright scheming heartlessness, when my Lord commonly acknowledges a slight twinge of conscience by writing his counsel in French. The purport of that advice may be gathered from one of the milder English observations:

> The gallantry of high life, though not strictly justifiable, carries, at least, no external marks of infamy about it. Neither the heart nor the constitution is corrupted by it; neither nose nor character lost by it; manners, possibly, improved.

It would be disingenuous to omit any al-

lusion to such passages as these, but it would be equally unfair to suppose that they give the tone to the Letters as a whole. Nor would it be just to condemn the frankness of their morals on the principle of *pueris reverentia*. It must be remembered always that they were written to an illegitimate son, to whom the preaching of rigid virtue would imply either repentance or hypocrisy on the part of the writer, and Chesterfield was neither repentant nor hypocritic. It must be remembered also that they were never intended for publication, and this for their literary as well as their moral qualities. Their greatest fault as compositions is a certain monotony arising from endless repetition of the same theme, very useful in pressing home the desired lesson, but rather irksome when the Letters are read together. Their chief excellence is their style, for which our admiration must be heightened by knowing they were entirely unpremeditated. To one who takes pleasure in the sheer mastery of a difficult artistic medium, the language of Lord Chesterfield must be a continual wonder and joy. He had not the measured eloquence of Bolingbroke, the gravity of Dr. Johnson, the naïve grace of Goldsmith, the homely elegance of Cowper, or the idiomatic ease of Gray; his style lacks color and magnetism; but he had other qualities which make his Letters on the whole the finest model of English of the mid-eighteenth century; and beside it most writing in English seems to wallow unwieldy. It is distinguished for precision, unfaltering directness, and a kind of splendid clearness. It cannot be judged from specimens, for its effect depends on sustained balance of tone; there are no purple patches. To read it is to feel such an exhilaration as comes from watching the swift, thin motion of a foil in the hand of a skilled fencer—and the foil has no button. We have seen how he trained himself as a stylist while at college, but his real masters were the great French writers, whom he knew personally and imitated, and to whom he was in turn *l'homme le plus spirituel des trois royaumes*. He had helped to introduce Voltaire and Montesquieu to British philosophy and government, and had filched from them the mysteries of French prose. His English is thoroughly idiomatic, but there is not the slightest jar in passing from his letters in that language to those in French scattered through the collection.

And from France also he borrowed another trait. Englishmen are not frank, or, perhaps, not logical. There is grossness and plain-speaking aplenty in their letters throughout the eighteenth century, but it is sheer naughtiness; they rarely deny the convention of morality. Now Chesterfield was French in conforming his standards with his acts. One finds extremely little of the contemporary coarseness in his Letters, but they accept unreservedly and, indeed, unblushingly inculcate the practical code of society as he knew it. They are overwhelmingly honest, honest in a far higher sense than can be applied, for instance, to the garrulous self-revelation of a Pepys, or to the portrait of a creature of impulse like Tom Jones. Here, if anywhere, the man of the world, the *honnête homme*, as he then was, and as, at heart, he still is, stands exhibited; there is something almost sublime in the dry unshrinking light cast upon him. And if much must be reprobated in that character, much also is admirable and at all times worthy of imitation. He was the late product of an art which has practically passed from the world. We are concerned to-day about our duties and our pleasures, and about the means of making life efficient; but who is concerned to mould his life into an artistic design? We write enormously of all the mechanical arts, but where is to be found a modern treatise on the one supreme art of living? It did not use to be so, as any one knows who has read the literature of the Renaissance.

It would carry me too far, even if I had the material at hand, to trace the development of this conception of life as one of the fine arts. There are hints of it in Xenophon and Horace and other writers of antiquity, but its real origin would be found in the engrafting of the classical sense of measure on the mediæval ideal of chivalry. Petrarch's sonnets and letters may be regarded as the opening of the voluminous literature that sprang up on the subject, and the "Decameron," with its bravely ordained delights against the background of the deadly plague, started its course in fiction.* From these sources the art became gradually defined and specialized, reaching its climax in Castiglione's elaborate dialogue on the training of "The Courtier," certainly one of the richest fruits of the Italian genius. The art came over seas to England with the rest of the Renaissance, and soon made itself felt in literature. Lyly's "Euphues" is at the head of the new genre, that book, to follow the title page, "Very pleasant for all Gentlemen to reade, and most necessary to remember: wherein are contained the delights that Wyt followeth in his youth by the pleasauntnesse of Love, and the happynesse he reapeth in age, by the perfectnesse of Wisedome." "The Faerie Queene" is the flower of the school in England, with its confessed attempt "to fashion a gentleman or noble person in vertuous and gentle discipline" by uniting "the twelve private morall vertues" of Aristotle with the graces of chivalry. There is a long drop from "The Faerie Queene" to Peacham's "Compleat Gentleman" (1622), but the ideal, *ut in honore cum dignitate vivamus*, is still in view, and we are preparing for Chesterfield in such passages as this:

There is no one thing that setteth a fairer stampe upon Nobility then evennesse of Carriage, and care of our Reputation, without which our most gracefull gifts are dead and dull, as the Diamond without his foile: for hereupon as on the frontispice of a magnificent Pallace, are fixed the eyes of all passengers, and hereby the height of our Iudgements (even our selves) is taken.

The Civil War left scant leisure or appetite for discoursing on delicate points of conduct, and the Restoration brought back with it all the froth of France without the substance. It remained for the dull and boorish court of Hanover to smother vice in vulgarity, and it was nothing to Chesterfield's discredit that both George II. and Caroline feared and detested him; his passionate pleading for refinement of manners may be understood when we read Hervey's record of the family doings at St. James's and Hampton Court.

These Letters of Lord Chesterfield to his son, then, are to be taken as a part, and perhaps the most valuable part, of that literature of Courtesy which began at the first dawn of the Renaissance. But it must not be supposed that in cultivating the art of life he meant to belittle the need of a substantial foundation. On the contrary, their whole aim was to prepare the boy for an efficient career as a statesman, not without the spur of generous service to his country. They insist upon strenuous study, although my Lord would avoid the pedantry of the universities; they declare again and again that nothing can be accomplished without application and the habit of attention. The first letter of the collection, written in French to the lad when he was only seven years old, is a disquisition in little on the necessity of cultivating eloquence, ending with the observation: "*Nascitur Poeta, fit Orator:* c'est-à-dire, qu'il faut être né avec une certaine force et vivacité d'esprit pour être Poëte; mais que l'attention, la lecture, et le travail suffisent pour faire un Orateur." In other words, the young Stanhope was already destined for Parliament. Nor is morality, as the writer understood it, neglected; he was earnest in trying to set the boy *à l'abri des grands écueils de la jeunesse*, and was not ashamed to warn him from the evils of gambling by his own example, for play, he had to admit, had been his one ruling and wasteful passion.

But it is true that toward the end these precepts are for the most part merely implicit in the letters and that the *fortiter in re* appears to be forgotten too often in the *suaviter in modo;* the end is swallowed up in the means. It happened that the young man developed a disposition studious and serious to excess, with little care for the graces; hence his Mentor's exaggerated emphasis on that side of education. The basis of Chesterfield's theory of education and something of his insight into the workings of human nature can be seen from a few quotations taken somewhat at random:

I would wish you to be a Corinthian edifice, upon a Tuscan foundation; the latter having the utmost strength and solidity to support, and the former all possible ornaments to decorate.

A proper secrecy is the only mystery of able men; mystery is the only secrecy of weak and cunning ones.

A man of the world must, like the chameleon, be able to take every different hue; which is by no means a criminal or abject, but a necessary complaisance, for it relates only to manners and not to morals.

Smooth your way to the head through the heart. The way of reason is a good one; but it is commonly something longer, and perhaps not so sure.

Knowledge may give weight, but accomplishments only give lustre; and many more people see than weigh.

Never seem wiser, nor more learned, than the people you are with. Wear your learning, like your watch, in a private pocket: and do not pull it out and strike it, merely to show that you have one.

It is hard to say which is the greater fool, he who tells the whole truth or he who tells no truth at all. Character is as necessary in business as in trade. No man can deceive often in either.

*The very tone and color of its gayer aspect are given by Boccaccio in the stately language of his introduction: "Io giudicherei ottimamente fatto che noi, . . . fuggendo come la morte i disonesti esempli degli altri, onestamente a' nostri luoghi in contado, de' quali a ciascuna di noi è gran copia, ce ne andassimo a stare: e quivi quella festa, quella allegrezza, quello piacere che noi potessimo, senza trapassare in alcuno atto il segno della ragione, prendessimo."

Have a real reserve with almost everybody, and have a seeming reserve with almost nobody; for it is very disagreeable to seem reserved, and very dangerous not to be so.

I, who have been behind the scenes, both of pleasure and business, and have seen all the springs and pullies of those decorations which astonish and dazzle the audience, retire, not only without regret, but with contentment and satisfaction. But what I do, and ever shall, regret, is the time which, while young, I lost in mere idleness and in doing nothing. . . . Do not imagine that by the employment of time I mean an uninterrupted application to serious studies. No; pleasures are, at proper times, both as necessary and as useful; they fashion and form you for the world; they teach you characters, and show you the human heart in its unguarded minutes. But then remember to make use of them. I have known many people, from laziness of mind, go through both pleasure and business with equal inattention; neither enjoying the one nor doing the other; thinking themselves men of pleasure because they were mingled with those who were, and men of business because they had business to do, though they did not do it. Whatever you do, do it to the purpose; do it thoroughly, not superficially. *Approfondissez:* go to the bottom of things.

Having mentioned laughing, I must particularly warn you against it; and I could heartily wish that you may often be seen to smile, but never heard to laugh while you live.

Good-breeding, and good-nature, do incline us rather to help and raise people up to ourselves, than to mortify and depress them; and, in truth, our private interest concurs in it, as it is making ourselves so many friends, instead of so many enemies.

The sure characteristic of a sound and strong mind is, to find in everything those certain bounds, *quos ultra citrave nequit consistere rectum.* These boundaries are marked out by a very fine line, which only good-sense and attention can discover; it is much too fine for vulgar eyes. In manners, this line is good-breeding; beyond it, is troublesome ceremony; short of it, is unbecoming negligence and inattention.

Whoever is in a hurry shows that the thing he is about is too big for him. Haste and hurry are very different things.

There is nothing reprehensible in all this, and Chesterfield's insistence on the minutest points of good-breeding—an insistence which cannot be conveyed to the reader by particular quotations—can be censured only when it is coupled with the cynical distrust of human nature which he learned from Rochefoucauld and La Bruyère—and from living society. Undoubtedly his instruction, despite his words to the contrary, too often leads to the conclusion that men are either knaves or fools, either deceiving or deceived by means of the mere semblance of things. The art of living has an ugly tendency to transform itself into a masque of imposture. His second great maxim, *volto sciolto e pensieri stretti,* is at times not far removed from Machiavelli's system of moral strategy, or, if we wish to remain within Great Britain, to Francis Bacon's adaptation of that system: "Have openness in fame and repute, secrecy in habit; dissimulation in seasonable use, and a power to feign if there be no remedy; mixture of falsehood is like alloy in coin of gold and silver which may make the metal work better." Well, it was the practical code of the day, if not of all days, and in the end our indignation reduces itself to Walpole's disgust at seeing folly and treachery clothed in frank authority. There is an inevitable injustice in writing about Chesterfield; the more questionable side of his morality somehow assumes an importance out of all proportion to its real place. Only long familiarity with his Letters can acquaint one with their better wisdom and their brave and unfailing acceptance of human conditions. It is depressingly easy to lay bare the snares to virtue they contain, whereas only here and there will any reader clearly apprehend and make his own that supreme art of living of which they are the last and most honest exhibition. They present the Sir Charles Grandison of real life. P. E. M.

PARIS BOOK NOTES.

PARIS, June 21.

From Easter to June is "the season" in Paris books as in society. This season an unusual number of new publications deal with our own day and generation, that of the Third French Republic.

The most surprising to those avid of real personalities half slips out of this group because its author, Charles Bocher, is in his ninety-second year, and, including what he has been told at first hand, proudly puts on the title-page of his Memoirs—"1760 to 1907." He has long been known to Tout-Paris as the "dean" of the *habitués* of the Opera; he began in 1828, four years after the death at ninety-two of another dean, the Marquis de Mornay, who had fought in 1745 at the battle of Fontenoy. M. Bocher's godfather was the future Charles X.; and his own father told him personal experiences of the Old Régime and the Revolution and Empire. His college professor was Philippe Lebas, son of Robespierre's companion in life and death, and he himself well remembers Robespierre's aged sister. His school examiners were Cuvier and Ampère. Madame de Chateaubriand gave him chocolate of Sundays, and he was admitted as a young man to the close circle of Madame Récamier. He entered Saint-Cyr in 1836; and he passed his vacations with the last of the famous family of geographers, Cassini, who was then eighty-eight and retailed gossip told him by his own grandfather from the seventeenth century and the Court of Louis XIV.

Madame Adam publishes the fifth volume of her Memoirs—"Mes angoisses et nos luttes (1871-1873)"—notes taken day by day during the cruel downfall and swift resurrection of France. Victor Hugo sat up all night to read them. Madame Adam helped then to give Gambetta his predominance in the transformation of their country; the test of experience has perhaps since shaken her confidence in his political wisdom, so true is it that the Radicals of one generation are the Reactionists of the next; at the time a bitter critic described Gambetta as "a one-eyed man who only saw one side of things."

A sober historical work, by one who figured in the strife and not on Gambetta's side, is "L'Assemblée Nationale de 1871," by Senator de Marcère, a founder and leader of the Republican Centre. This second volume finishes the Presidency of Marshal MacMahon—"the end of the Conservative Republic," which Thiers said was the only Republic that could endure in France, and which Gambetta made finally impossible. The impartiality of this volume is praised even by those who look on its author as the type of a Reactionary. The remaining notes of Gontault Biron, first French ambassador to Berlin after the war, complete another work on this period.

"Le Cœur de Gambetta," by Francis Laur, former Deputy, deals with ultra-private life; it includes the letters to Madame Léonie Léon, whose recent death revived interest in the famous *liaison.* The book is not without historical importance, as showing the substantial nature of the man who transformed France.

"L'Émigré" of Paul Bourget is, of course, fiction; but it essays to deal honestly and philosophically with those who have an inherited homesickness for the Old France. It belongs to that growing school of *intellectuels—idéologues* was Napoleon's name for them—who would complicate the forward evolution of France with a definite revolution backwards.

A very frank book on the immediate danger—"Le Péril de la race," by Émile Pierret—treats of three physical evils more tangible than ideas—*avaric,* alcoholism, tuberculosis. Minds that jump at conclusions should reflect how the same evils exist in all civilized countries, and that the cry of alarm for the tainted part of a population should not be used to bolster up legends about the wholesome mass.

In the "Confessions de ma vie," by Wanda de Sacher-Masoch, we skirt other abysses of civilized aberration; yet neither she, nor the husband whose name she bears—the Sacher-Masoch of the harmless Jewish stories and of the harmful aberration known by his name—nor the second husband known as "Jacques Saint-Cère," was French; and mere living in cosmopolitan Paris could not make them so.

Paul Verlaine, on the contrary, with all his abyssmal faults, may be claimed by France as her own honorably; he was in at the start of the recent poets, of whom he is easily the first; and the occasional soaring of his verse to the gates of heaven has not a little helped to the present religious revival. Three publications concern him. One, of little worth, reproduces his own prose concerning France. The second is made up from documents (very human) gathered by his publisher, Léon Vanier—"Verlaine intime," by Ch. Donop. The third, aiming at more completeness—"Paul Verlaine, sa vie, son œuvre"—is by the veteran journalist and *littérateur* Edmond Lepelletier.

In the controversies which here and now stir men's souls, we have the final volume of that valiant fighter, Brunetière—"Discours de combat." Pastor Wagner applies his non-combatant methods of the Simple Life once more in *causeries* "Pour les petits et les grands." Jules Bois, who began years ago by scrutinizing the "little religions" of Paris and then went further to a large volume on Satanism, after rounding his experimental studies in India, gives a fairly disillusioned book on "Le Miracle moderne."

In politics, which are more pressing because more violently active than religion, there is a handbook of the leading party—"Le Socialisme à l'œuvre," by the able Georges Renard and others. It sets out to describe what has been done and what can be done, first to solve the economic problem by the association of persons and the socialization of things; second, the political problem, universal suffrage, the Referendum and Initiative, Internationalism and

the fiscal question; and third, the intellectual and moral problems, the organization of the family and education. C. Poinsot gives the romance and poetry of "Littérature sociale," particularly from Victor Hugo, Émile Zola, Paul Bourget, Clemenceau, and the brother novelists who sign J. H. Rosny. Gustave Téry, who was a university member until amputated for advanced opinions, talks back incisively at Socialism in a little book about "Jean Jaurès."

The *Figaro's* "petite chronique des lettres" reappears in book form in "Le Mouvement littéraire en 1906," by Ph.-Emmanuel Glaser, with a preface by Jules Claretie. Émile Faguet publishes a fourth series of his periodical judgments under the title of "Propos littéraires."

Among the very costly art-books one deserves notice for its technical possibilities, "Les Salons d'architecture," published by Charles Schmid and made up of 250 reproductions from the two Salons of the present year. S. D.

Correspondence.

VERROCCHIO AND EARLY LEONARDO.

To the Editor of The Nation:

Sir: If I return to Mr. William Rankin's interesting letter on the early work of Leonardo, in the *Nation* for May 16, it is less because his views happen to be largely mine as well, than because I fear that only a handful of your readers know how prolonged and intimate has been his study of Leonardo. No one on our side of the water speaks with greater authority on such a matter. Instead of laboring small points of difference, between him and one who has learned much from him, it seems better worth while to point out that the supposition that Leonardo did considerable painting on such Verrocchian canvases as the Baptism of the Accademia and the Annunciation* of the Uffizi, corresponds closely to the historic probabilities of the case. It is about the opinion that a trained historian would arrive at, after weighing the chronological evidence and studying the Verrocchian group of pictures discursively, without Morellian or other prepossessions.

It may be asked why, in the absence of sufficient graphic evidence, no one has taken this cautious attitude towards so delicate a problem. The answer is obvious, because Verrocchio happened to be the master of Leonardo, and all critics have unconsciously been moved by the natural desire to reconstruct a Verrocchio worthy of that high responsibility. Dr. Bode's wholesale attribution of nearly all the works of the school to its head undoubtedly represents the desire to show that Verrocchio at least painted much. Mr. Berenson's and Miss Cruttwell's more cautious delimitation of his *œuvre* by quality, seems again to bespeak a desire to prove him a genius of the exquisite and experimental sort, a proper prototype for his greater pupil.

It seems to me that the time has come, since the defective material does not lend itself to the established procedures of connoisseurship, to approach the matter from the simple point of view of historic probability, considering Verrocchio painter merely on the basis of the general evidence, and eliminating all pictures that have been attributed to him on purely stylistic grounds. Thus considered, the unchallenged evidence for Verrocchio painter boils down to a single picture, the Baptism of the Accademia—an unfinished and undated panel concerning which we have Vasari's disquieting report that a portion of the work is Leonardo's. Clearly, we must build cautiously on so shaky a foundation.

Fortunately, the dates of Verrocchio's activity and Vasari's account of his beginnings, together with the dates of his chief pupils, do combine to give us certain probabilities. Verrocchio was born in 1435, and worked as a silversmith before he became the head of an *atelier* of sculpture and painting. As late as 1477 we find him working as Pollaiuolo's subordinate on the silver dossal of the Florence cathedral. We may fairly assume, then, that his beginnings as the head of his own studio of the major arts were late. In all probability, he would hardly have taken the forward step until his thirtieth year, or thereabouts, say somewhere near 1470. What Vasari tells us about Verrocchio's commissions, and the absence of early scupture, would make even a later date credible enough.†

Now Leonardo was born in 1452, and while we do not know the date of his apprenticeship, the custom of the time does not permit us to put it far from his sixteenth year. Let us say, then, somewhat before 1470. He was then, as we know from other sources, one of Verrocchio's earliest pupils in painting. And this is suggested as well by his constant influence upon the unoriginal Lorenzo di Credi, by seven years his junior. We know from Vasari, too, that Leonardo assisted his master as well in sculpture as in painting. Luckily we have that precious landscape drawing in the Uffizi, dated 1478, to tell us the kind of proficiency Leonardo had gained in his early prentice days. Mr. Rankin has properly emphasized its significant likeness to the background of the Baptism. It is even more important to realize its magnificent quality. It transcends anything we can imagine of Verrocchio's at such a date. In fact nobody but the young Leonardo, at that time, if indeed for nearly twenty years following, could have approached it. In other words, at twenty-one Leonardo had nothing to learn from anybody about landscape, being a full generation ahead of his time. But it may be urged he had had the benefit of four or five years of Verrocchio's teaching, of which this masterly sketch is the fruits.

This argument may best be met by reviewing the landscapes produced by others of the school presumably under Verrocchio's guidance; and here no one can deny that, eliminating Leonardo and the contentious pictures that suggest him, nothing in the treatment of landscape by Verrocchio's pupils would lead us to believe that he was either a master or an innovator in this field. Study the landscapes of Botticini in his Verrocchian phase, take the backgrounds of such typical school pieces as those of Berlin and London, follow the landscapes of Lorenzo di Credi, or better yet, learn at San Domenico, Fiesole, how completely he attenuates, in copying, the noble background of the Baptism—and no impartial observer, I am confident, will feel that these pupils imply a master profoundly versed in the landscape art. On the other hand, whenever, as in the Baptism and Annunciation, one does find a Verrocchian painting with a fine landscape, Leonardo is the name that instinctively flies to the lips, and the probable dates never forbid such an hypothesis. I would willingly urge what seems to me the more positive evidence of a close similarity in workmanship, amounting almost to identity, between Leonardo's Adoration of the Kings and the background of the Baptism, but I despair of making concrete to others what is a profound personal experience.

Let us now weigh also the significant fact that we possess no assured work of Verrocchio antedating Leonardo's entrance to the studio, recalling as well that Leonardo brought to a man who had exchanged goldsmithing for painting the mastery implied in the landscape sketch of 1478. Let us remember that Vasari, whose æsthetic estimates in matters Florentine are seldom faulty, describes Verrocchio as laborious rather than spontaneous, retaining to the end in both sculpture and painting something "hard and dryish" (*la maniera alquanto dura e crudetta*), put beside this Verrocchio's thrifty habit of employing student labor to the full, as shown in the famous case of the Virgin in the Duomo, Pistoia (see Maud Cruttwell's interesting account), and we have a concentration of historic probabilities all pointing to Leon-

*The difficulty of reconciling the archaic Annunciation of the Uffizi with the far freer and more advanced reduction in the Louvre seems to me to be exaggerated by Mr. Rankin and all the critics. In the first place, the attribution of that little masterpiece to Leonardo is an assumption, if a convincing one, and its ascription to his early period is equally an assumption, if a wholly plausible one. These points are raised not because I doubt either hypothesis, but because it is well to note how little we are really justified in regarding the technic of the Louvre Annunciation as the touchstone for Leonardo's early work. For this it simply will not serve. It is quite as difficult to reconcile its manner with that of the Madonna of the Rocks or of the early drawings as it is with that of the Uffizi Annunciation. But must the reconciliation be effected? One is permitted to believe that the smaller panel, though early, may follow the larger one by several years. An even better view is simply that the small scale and importance of a predella gave Leonardo an opportunity to adventure boldly, to take technical liberties that would not have been tolerated in a painting of larger scale. We must beware of supposing that the technic of an eagerly inventive genius follows unbroken lines of progress. One must expect to find all sorts of throwbacks and anticipations. It is the contrary presumption that has brought the transcendental chronologizing of the old masters, especially as practised by the German and Germanizing school, perilously near to organized pedantry. A little observation of modern artists would humanize the severity of such a theory. Am I wrong in suggesting that in his water colors Winslow Homer has anticipated by full twenty years what the art criticism of the future will solemnly call his "latest manner"?

As for the Uffizi Annunciation I feel a far greater *finesse* in the painting of the Angel than in that of the Virgin and the architectural forms. The difference is largely effaced in the photographs, but is patent, to me at least, in the picture. The Virgin is more heavy-handed both in conception and execution. I cannot believe that Leonardo could have so perfunctorily tinted another's cartoon, and since the style is not that of any of the numerous school pieces nor yet below their general level, we are perhaps justified in divining Verrocchio himself in this figure. With Mr. Rankin I entertain a strong hope, if not quite a conviction, that the Angel is by Leonardo. That Verrocchio at any time was capable of the exquisite delicacy of touch in the tree profiles and the landscape seems simply incredible to me. These qualities surpass the capacity of any one in the *milieu*, saving only Leonardo.

†It should be remarked that Vasari in the life of Lorenzo di Credi speaks as if Verrochio's preoccupation with painting were recent when Lorenzo entered the studio. Lorenzo had been first trained as a goldsmith, and one may assume that he came to Verrochio somewhere near his sixteenth year, say, 1475. This agrees with Vasari's statement that Lorenzo began by imitating Leonardo, and in a way confirms the date 1470, roughly suggested above for the opening of Verrocchio's *bottega* of painting.

ardo as the creator of the most gracious products of the *atelier*. That he should not so have been employed would be a fact so strange as to require special explanation.

I believe we may go further and say that there is practically no evidence that Verrocchio was an accomplished painter. The nearer we approach him through his school, excepting Leonardo, the nearer we come to something essentially mediocre, as Vasari truly put it, "somewhat hard and dryish." On purely historical grounds we are fully justified in presuming that Verrocchio was rather an *entrepreneur* of painting than a painter in his own right. His complexion in the rare capacity of painter, one may grasp in the gaunt and impressive figures of the Baptism. Nothing else of the many pictures that derive from him seems so autographic. The spectacle of one who painted little, and none too well, being a great head of a school (which has bothered all the critics of the subject), should really trouble no one. Besides the classic instance of Squarcione, one might cite, were it not ungracious, many painters of to-day, who have made their successes as teachers, yet are not likely to be remembered for their own canvases. As for Verrocchio, his repute as an experimenter and his early adaptation of the oil technic are sufficient to account for his vogue as a master.

If I were not unwilling to ride the free horse of historic probability too hard, I would hint that Verrocchio probably learned far more from Leonardo than he ever taught. Such a theory tallies with the flexible and eclectic nature of the artist described by Vasari and glimpsed through the sculptures. We have already noted that nothing of any consequence in Verrocchio's *œuvre* can be set before the artistic maturity of his greatest pupil. It is a short step from that observation to supposing that the mysterious and pervasive influence which we term the Verrocchiesque is in reality chiefly the influence of the youthful Leonardo, skilfully exploited by his master, and that Verrocchio himself was the single artist of sufficiently receptive capacity to profit by the example daily under his eye. In this connection it is instructive to recall how little Lorenzo di Credi, a stolid talent if there ever was one, failed to grasp the spirit of the Leonardesque while conscientiously aping all Leonardo's tricks of draughtsmanship. I have hinted that it might be a permissible inference to see in such sculptures as the David, the Marble Lady of the Bargello, and the Christ and Thomas of Or San Michele a projection of Leonardo across the temperament of his gifted master. I would say rather that so hazardous a supposition seems to me to have more in its favor than the assumption that such a wraith as Verrocchio is in painting created those lovely and wholly masterful landscapes of the Annunciation and Baptism.

In any case I would plead for a return from the confessedly inadequate pictorial evidence to some such reappraisal of the matter by historical standards as has here been most tentatively essayed.

FRANK JEWETT MATHER, JR.

Florence, June 18.

COLLEGE AUTHORITY.

TO THE EDITOR OF THE NATION:

SIR: The letter of Mr. Super in your issue for June 13, and your editorial note in the same number, on "academic freedom," have brought to my mind the fact that there has not been generally published—so far as I am aware—any adequate account of the form of government adopted for this university some three years ago, soon after the administration passed into the hands of our first *de facto* board of trustees.

The new system of organization is marked by what might be analyzed as four distinguishing elements: the election of a committee by the faculty, designed to act as a check upon the powers of the president; the assigning to other elected committees of some of the most important details of academic administration; the real authority of the faculty, coupled with freedom of debate, in the development of the educational policy of the university; and the remarkably large freedom and power of the department faculties and the individual members thereof.

The first of these points is probably most characteristic and interesting. An advisory board, consisting of nine members of the faculty of the rank of full professor, and representing the various departments arranged in groups based on relationship of subjects, is elected by the entire voting membership of the faculty. (This voting membership includes professors, associate professors, and assistant professors who have been members of the instructing body for three years.) The essential duties of this board are best stated in the words of the articles of organization:

> The advisory board shall advise the president concerning any matters which he may choose to refer to it. All executive acts of general importance, such as recommendations for appointments, promotions, and dismissals, and for the abolition of departments and chairs, shall be submitted to the advisory board for approval before they shall become operative, or before they may be submitted to the trustees for their action. . . . In all cases, in presenting such matters to the board of trustees, the president shall state whether or not they have the approval of the advisory board.

By these provisions, while the final authority of the corporation of the university is unimpaired, it is impossible that it should take action on any important matter —including the appointment or dismissal of the humblest officer of instruction— without having laid before it the advice of this representative committee of the faculty.

The second and third points may be considered together, and very briefly. Committees which distinctly represent the administrative duties of the president—such as those on athletics, discipline, and scholarship—are still appointed by him; but those having to do with educational policy —conditions of registration or graduation, conduct of examinations, the administration of the library, and the like—are appointed by the Executive Committee, which in turn is elected by all the voting members of the faculty. Such committees report their recommendations to the faculty itself, and these recommendations, when debated and adopted, unless they relate to matters fundamentally concerning the organization of the university, do not require the approval of president or trustees.

The fourth point, the independence of the several department faculties and their members, is—from the standpoint of the individual instructor, at least—of no less importance. All instructors in the department are entitled to take part in the deliberations of its faculty, although only the voting members of the faculty at large vote on formal matters here. The chairman of the department is appointed by the president of the university, but his only important function—apart from the cooperation of his colleagues—is the making of recommendations for appointments and promotions. On all matters of department administration, such as the giving of courses, the expending of library funds, and the recommendation of candidates for all degrees, the department acts as a body, and its action is ordinarily final. It need hardly be said that this freedom to make one's self heard, no matter how humble one's academic rank or how hopeless the minority in which one finds one's self, is a privilege which to instructors in many universities would seem as sweet as it would be strange.

When all this is said, it may be asked: How does the system work? Democratic organization is one thing on paper, perhaps quite another in reality. To this query it is still too early to make any final reply. Three years is a short time in the life of a university. But in general it may certainly be said that the president, the faculty as a body, the various committees, and many of the departments, have taken the new form of organization very seriously, and have given every evidence of sincerity in their desire to work along its lines. The president has referred to the Advisory Board not only those matters which the articles of organization required him so to refer, but almost numberless matters on which he might have taken action unadvised; and if in any matter he has made a recommendation to the trustees after the Advisory Board has declined to approve it, such an instance has not transpired. The Advisory Board itself has perhaps been more conservative than was to be expected, and its first report to the faculty consisted almost wholly of the enumeration of sundry new departures which had been proposed to it by either the president or others, and which with almost unvaried regularity it had declined to prefer to the *status quo*. This circumstance has led some to think that such a body will remain a mere form, through which the older professors—heads of departments in particular—may from time to time express their content with things as they are. But this is hardly a just inference. The Board was elected by the faculty as a whole; it enjoys no permanent tenure of office; if the faculty does not secure more radical representatives, it is simply because it is not a radical body. Perhaps, since the powers given to this new body were somewhat revolutionary in character, from the standpoint of American college traditions, it is a matter for congratulation that they showed themselves on the whole less concerned to destroy than to fulfil. The faculty as a whole has indulged in free and widely varied debate, and has set its committees to re-examining almost every part of the educational policy of the university; and if these committees have usually failed to recommend very startling changes, this again means simply that the younger and more progres-

sive party is still in the minority, and must wait its time—either to accomplish its wishes or to become conservative in its turn. Having used the word "party," I must basten to add that, properly speaking, no such thing has existed, and that the various deliberations and elections imposed upon men who had formerly been used, in large measure, to silent acquiescence, have produced no cliques, no rancorous contests, nor other than good-natured debate.

RAYMOND MACDONALD ALDEN.

Stanford University, Cal., June 22.

NOISE IN MUSEUMS.

TO THE EDITOR OF THE NATION:

SIR: In your excellent editorial on the subject of the new Boston Art Museum, you failed to mention one very important feature of an ideal museum of art—a noiseless floor. In the average museum, all one's pleasure in a peaceful landscape or poetic group is battered to nothing by the massive footfalls of some strolling person in thick-soled boots. I seldom leave an art gallery without a maddening impression of vast, flat-bottomed, wooden-soled feet "planking" after me wherever I go. At our much-esteemed Metropolitan the custodians (or whatever one calls them) are distinguished by boots of extra resonance. One would think that the authorities might at least rubber-sole them. B.

New York, June 26.

Notes.

Routledge has in hand a new dictionary of Dickens of a very elaborate sort, compiled by A. J. Philip.

Prof. Gregory Smith is writing the life of Ben Jonson for the English Men of Letters Series—a notable lacuna which promises now to be well filled.

Henry Frowde is publishing a Sonnet-Sequence, by Theodore Watts-Dunton, on the unveiling of the Rhodes Memorial at Oxford, June 12.

The Revell Company will publish at an early date "The Parables of the Kingdom," by Dr. G. Campbell Morgan, and "The Courage of the Coward," by Dr. Charles F. Aked.

Two miniature volumes come to us from E. P. Dutton & Co. One is "A Dictionary of the Bible," by Albert M. Hyamson, very useful in this vest-pocket size for travelling clergymen; the other, "My Jest Book," with a good selection of anecdotes and witticisms selected by Mark Lemon.

E. P. Dutton & Co. issue the following volumes in their New Universal Library: Hazlitt's "Liber Amoris"; Ruskin's "Harbors of England" and "Poems," and "Lucretius on the Nature of Tbings," translated by H. A. J. Munro. To the London Library they add a translation of "Beowulf," by Wentworth Huyshe; and to the library of Wayfaring Books "The Pocket Plato," edited from Jowett's translation by S. C. Woodhouse, and "The Voice of the Sea," edited by Ingram Swale.

Henry Holt & Co. have the following titles on their first autumn announcement: "The Helpmate," by May Sinclair; "A Turnpike Lady," by Sarah N. Cleghorn; "The Flight to Eden," by Harrison Rhodes, "The Luck of the Dudley Grahams," by Alice Calhoun; "The Youngsters of Centerville," by Etta Anthony Baker; "The Treasure of the Canyon," by J. B. Ames; "Harps Hung Up in Babylon," poems by Arthur Colton; "A Hundred Great Poems," compiled by R. J. Cross; "The Greater English Poets of the Nineteenth Century," by W. M. Payne; "Leading American Soldiers," by R. M. Johnston; "Biographical Sketches of Graduates of Yale College," vol. iv., by F. B. Dexter; "American Trees," by Nathaniel Lord Britton; "Darwinism To-day," by Vernon L. Kellogg; "Wage-Earners' Budgets," by Mrs. Louise R. More; "Historical Atlas," by Earle W. Dow, and a 1908 edition of Lester & Knowles' "Cheerful Year-Book."

Laurens publishes three new monographs in Les Grands Artistes: "Paul Potter," by Émile Michel; "Prud'hon," by Étienne Bricon, and "Daumier," by Henry Marcel.

We are to have next year three official biographies of English cardinals. Wilfrid Ward has about finished for Longmans the life of Newman on which he has been engaged for some time. Then, as an antidote to Purcell's indiscreet book on Manning, there is to be a life by Father W. H. Kent; and, thirdly, G. Sneed Cox, the editor of the *Tablet*, is preparing a volume, or volumes, on Vaughan.

Not less than thirteen of the twenty-five volumes tbat will compose Oscar Levertin's "Samlade Skrifter" will contain material that has not yet been published in book form. Much of this will be entirely new, from manuscripts which were found at his death, but the bulk of it has already been printed in one form or another, mostly in magazines and newspapers, especially in *Svenska Dagbladet*, of which he was literary editor at the time of his death. The parts that so far have been published comprise the first volume, with his early "Legender och Visor" and "Nya Dikter," and the beginning of the ninth "Svenska Gestalter," in which he stands at his highest as interpreter of literature and life. Volumes 10 and 11 will follow next, witb hitherto unpublished "Essays."

Edward H. R. Tatham, in a letter to the *Athenæum*, gives three Latin poems by W. S. Landor taken from unpublished letters to Walter Birch. One of these is in a letter dated Pisa, November 27, 1818, and is inspired by the absence of liberty in Italy:

> Juravit æquos facere cunctos Gallia
> Et fecit—æquos namque non possunt opes
> Virtus, honores, reddere; aut ipsa Æquitas
> Reddit, tenetve lubrico parum statu
> Seu purpuratos sive nudos Servitus.
> Gaudete Galli! at Itali multo magis
> Gaudete! quippe semper hæc vobis fuit.
> En auctiora cuique patrimonia!

Another is an epitaph on C. J. Fox, occurring in a letter dated Pisa, January 30, 1826:

> Torrens eloquii, inque præpotentes
> Iracundus et acer, et feroci
> Vultu vinculaque et crucem minatus;
> Placandus tamen, ac velut catellus
> Qui morsu digitum petit protervo
> Tum lambit dedes—tuis amicis
> Tanto carior in dies et horas
> Quanto decliperes magis magisque—
> O Foxi lepide, O miselle Foxi,
> Ut totus (me ita di juvent) peristi,
> Qui nec fallere nec potes jocari!
> Quâ nemo cubitum quatit quiescis—
> Væ jacta alea! væ silens fritillus!

Correspondents from Rome outline the contents of the promised new Syllabus, which in church circles is declared to be an important document attacking modern errors in Biblical research in theology and philosophy. The *Figaro* reports tbat the preparation of this document was inspired by Pius X., but that it is chiefly the work of the office in the Vatican. The authors whose views are attacked are said to be chiefly English, French, and Americans.

The total enrolment in the universities of Austro-Hungary, according to latest reports, is 24,578. Naturally, Vienna leads with a student body numbering 8,505, namely, 222 in the theological department, 3,523 in the law, 1,725 in the medical, and 3,025 in the philosophical. Proportionally, Vienna occupies a more prominent position among the universities of tbe empire than Berlin does in Germany, but not as great as Paris does in France. Of the other Austrian universities, Graz reported 2,030 students, Innsbruck 1,092, and the German University in Prague 1,610.

In the Beilage of the Munich *Allgemeine Zeitung*, Heft 22, are published tbe details of the Chinese Imperial decree, dated April 11, establishing schools for the education of girls throughout the empire, which, as this journal remarks, puts the finishing touch to the school reform scbeme recently begun by the Government. Normal colleges or schools are to be establisbed in all of the provincial capital cities, and later on in otber centres of population, while primary schools for girls are to be opened wherever possible. All these are to be Government schools; but the establishment of private institutions is not to be discouraged—these, however, to be under Government supervision. Instructors may be natives of Cbina or foreigners. Evidently, the whole scheme has been modelled after that introduced in Japan, and rules have already been promulgated forbidding the wearing of expensive silks or ornaments by the pupils, and also the use of costly perfumes, and the like. The regulation demands that the "cruel and harmful" custom of preventing the natural growth of the feet be stopped; gymnasiums and playgrounds for physical exercises in connection with these girls' schools are to be established. In the same decree the Government announces that fifteen Cbinese cadets are to be educated at the expense of the state for five years in the schools of France.

Special attention is given in the current *Public Libraries* to the question of the open or closed shelf in colleges. Two papers, one by H. R. Mead of the University of California, and one by W. I. Fletcher of Amherst College, are devoted entirely to it, while others touch on it incidentally. Mr. Mead, who speaks from experience in two large universities, one maintaining the open system and the other having tbe main stacks closed, says there is not only less loss of books, but also a better and more satisfactory service of students and faculty where the stacks are closed. Tbe majority of readers are confused wben in direct contact witb a large collection of books, this being particularly so in tbe case of a university library wbich aims to contain all, rather than a selection, of books on a

particular subject. No statistics, he says, can show the extent of the inconvenience caused by careless or deliberate misplacements. It is true, he admits, that for many people, there is a profit and satisfaction in the examination of the books on the shelves, but this can be supplied in two ways: (1) By means of the open reading and reference room, which should contain besides reference books proper, the best books on the various branches of knowledge; (2) by admitting to the stacks for a limited period the special student who has shown himself capable of using to advantage this privilege. On the other hand, Mr. Fletcher holds that the open-shelf system, as maintained at Amherst for several years, has amply justified itself in results, and that both faculty and students would object strenuously to any radical change. His support of the open stack, however, is hardly so decided or enthusiastic as would have been the case a few years ago. He says:

> We are certainly suffering increasingly year by year in loss of books and in displacements of volumes on the shelves. I note an effect of free access which may come under the saying, "Familiarity breeds contempt." Not only do the individual students exhibit the carelessness of one who has come in two or three years of frequenting the library to treat it much as he would his own study, but the influence becomes traditional, and the whole student body seems to be increasingly devoid of the respect akin to awe with which we in our younger days entered a library by the gracious permission of those in charge.

Dr. Canfield of Columbia University contributes to the discussion the somewhat radical opinion—which he says he has held for many years—that "a collection of 8,000 volumes or thereabouts, carefully selected and kept fresh and up to date, constitute an entirely sufficient library for the undergraduates of any college."

When a Frenchman travels in foreign parts, his journey begins the moment the threshold is crossed. Thus René Fago in his "Vers les steppes et les oasis, Algérie-Tunisie" (Paris: Hachette) gives us three chapters before he sets foot in Algiers. But the reader gains by it: the sketch of Marseilles, slight though it be, brings out its subject. And so of the whole work. M. Fage himself would not deny its slightness, but it is the slightness of the artist who brings out the essentials, and leaves to the imagination the task of filling in the detail. Various cities were visited by M. Fage; these and the intervening journeys are described with a bold and sure touch. If a few discomforts and inconveniences can be endured, here is a fresh field for our tourists, jaded by the beaten tracks of Europe. Jules Claretie of the Academy has written a sympathetic preface to this delightful little book.

John W. Taylor, in the "The Coming of the Saints" (E. P. Dutton & Co.), has collected a mass of legendary matter relating to the introduction of Christianity into Provence and England. The greater part of his book deals with the traditions of the three Maries (and their companions), St. Trophimus, and St. Joseph of Arimathea. An outline is given of Rabanus Maurus's "Life of St. Mary Magdalene," who is identified by Rabanus with Mary, the sister of Lazarus, and with "the woman that was a sinner"; the relation of St. Joseph to Glastonbury is treated at length. Here and there historical and quasi-historical matter is mingled with the narration of the legends, particularly in the account of St. Joseph, who, our author thinks, may well have followed the route of the tin-traders to Cornwall. With a serious simplicity and enthusiasm that almost disarm criticism Mr. Taylor recognizes a considerable historical value in this late legendary material. He mentions with approval the opinion of Dr. Pryce (1790), who thought that Cornish and Breton were Semitic dialects; he regards it as probable that Jewish, or "Sarasin," tin-workers of 400 B. C. and downwards left their impress on the race. If these old workers were Jews, it was natural that they should be known to the traders, and from the latter Joseph might have heard of the Jewish colony, might have come to Cornwall to preach to his fellow-countrymen, and so might have stayed and founded Glastonbury. In the same spirit Mr. Taylor deals with the traditions relating to Trophimus and the Maries. If, instead of constructing imaginary histories, he had endeavored to account for the rise of these legends, he might have added a chapter to the history of the early English church; as it is, his volume is a collection of fanciful stories, and nothing more.

For "Scenes and Shrines in Tuscany," by Dorothy Nevile Lees (E. P. Dutton & Co.), we have nothing but praise. Miss Lees half apologizes in the Prelude for adding another to the long list of books that have been written about Florence. Her excuse is love for the glorious city and for Italy, and her reviewer can add that this love is supplemented by an excellent literary gift. Miss Lees lived in the city itself and on a villa near by, enjoying the somewhat rare privilege of being domiciled with an Italian family of the upper class. To this family belongs her little six-year-old friend, Mafalda, who, with her big sister, Francesca, and the contadini on the villa estate, form a group as interesting as if they were characters in a story. There is also described a charming *villeggiatura* near Monte Amiata, which gives occasion for the recital of the adventures of David Lazzaretti, the excommunicated and outlawed revivalist. Episodes in the daily life of the people, like the Harvest, the Vintage, and All Souls' Day in Florence, are described with knowledge and insight. We advise even those to whom a sojourn in Tuscany is a future experience to read this book, together with Mr. Carmichael's "In Tuscany," not only for the interest and information, but also for the lesson that to know this or any other part of Italy, they must learn something of the language, and go among the people in small town and country. Errors are few and unimportant. On page 35, for "Buffalmarchi" read Buffalmacchi. "Villari" on pp. 35 and 140 is a mistake for Villani. The work of the Della Robbia ought not to be called "pottery" (p. 204).

To those unlucky beings whose physical condition drives them from home we may recommend a little book by George B. Price on "Gaining Health in the West" (B. W. Huebsch). There is a comparison of the climates of Colorado, New Mexico, and Arizona, as these are suited to the out-of-doors life of the invalid, and chapters are added on such vital questions as "Getting Employment," "How to Avoid Loneliness," etc.

The International Handbooks to the New Testament, a series projected by the late Orello Cone, who himself wrote the volume on Hebrews, Colossians, and Ephesians, is brought to a close in a fourth volume by Prof. Henry Prentiss Forbes, of the Canton Theological School, on "The Johannine Literature and the Acts of the Apostles" (G. P. Putnam's Sons). An effort has been made in these Handbooks to answer the questions concerning doctrine and belief which arise in the mind of the general reader of the New Testament, rather than to discuss questions of grammar and philology, and to a degree unusual in works of the class the topics handled are those on which one turns to a commentary for light. Explanations are concise and clear, unimportant matter has been neglected, and economy of space has been studied. The point of view of Professor Forbes is that of advanced criticism, according to which the Johannine authorship of the Fourth Gospel is "improbable in the extreme," and the Acts is composed of sources of varying authority. The reader is furnished in brief compass with a sane and independent judgment on the facts brought to light by the most thorough historical criticism. The commentary on the Revelation in this volume is especially satisfactory.

In Edward F. Bigelow's "The Spirit of Nature Study" (Barnes) the ear-marks of the pedagogue are rather too prominent for the most enjoyable reading. The essential vitality of "nature study" is demonstrated by nothing more convincing than its ability to outlive the innumerable methods which its professed votaries are ever trying to force upon it. The royal road by which the child may approach the secrets of nature, according to Mr. Bigelow, is to select some natural object absolutely without let or hindrance from his elders, and give his attention to that. He can hardly imagine a greater crime than that of the mother who ordered the coachman to kill a large king-snake which a little boy in his class had brought home as an object of study under these instructions. What are a mother's nerves, to be set over against a boy's "development"? Of course, it is ruinous to make a regular habit of checking a child's spontaneous enthusiasms, but the possible pathways to his interest are not so limited that the feelings of others must be wholly disregarded rather than that any single one of these pathways be closed. For either teacher or pupil a good book on some phase of nature itself is likely to be of more profit than a whole library of theories or homilies on "nature study."

Mrs. Elizabeth Cabot Cary Agassiz died in Arlington Heights, Mass., last Thursday afternoon, at the age of eighty-five. Mrs. Agassiz, whose home was in Cambridge, while visiting a niece in Arlington suffered a paralytic shock on Monday, from which she did not recover consciousness. She was a daughter of Thomas Greaves Cary. In 1850 she was married to Dr. Louis Agassiz, the world-famous zoologist, whose first wife, the talented Cecile Braun, had died in Neuchatel not long after Agassiz's coming to America in 1846. Mrs. Agassiz was associated intimately in

many phases of her husband's work. She accompanied him to Brazil in 1865-66, and in 1871-72 went with him on the Hassler expedition. She also assisted him in his literary work, and was herself the author of a life of Louis Agassiz, and of a volume entitled "Seaside Studies in Natural History," in which she collaborated with her stepson, Alexander Agassiz of Harvard, one of the first authorities on marine life. Mrs. Agassiz was active in the development of Radcliffe College. She gave generously to the institution from her own wealth, and promoted its interests in every way. At the age of seventy-two, she accepted the presidency of the college, which she held for eight years, resigning in 1902. She was succeeded by Le Baron Russell Briggs, dean of Harvard College. Agassiz Hall, the centre of the social life of Radcliffe, was built and presented to the college in honor of its benefactress. Mrs. Agassiz of late years made her home with Prof. Alexander Agassiz.

RECENT POPULAR BOOKS ABOUT INDIA.

It is not often that the casual visitor to the East reproduces his impressions so vividly as Sidney Low has succeeded in doing in "A Vision of India" (E. P. Dutton & Co.). As special correspondent of the London *Standard*, Mr. Low had, to be sure, the exceptional advantage of "doing the country" in the train of Royal Highnesses, whose progress through the Empire of India he accompanied in 1905-6. But the author had another advantage, not due to Imperial favor, that of possessing the wit to deviate frequently from the route of royalty, and thus to discover for himself what is not given to all, least of all to royal eyes, to see. Books of the same intent are common enough, but Mr. Low seems to have got nearer to the under truth of things than most of his predecessors, as witness the almost photographic accuracy of the chapter on the Anglicised Maharajah. Our only quarrel is with the title Mr. Low has chosen, for there is more careful study than "vision" in his book; but it is the better for that, and those not already satiated with "impressions of India" may find profit as well as pleasure in following this pilgrim's private progress. Perhaps more profit than pleasure, for what joy is it to know that "Pariahs and Christians" are put under one head in the army list, or that converts to Christianity from any caste, save that of outcasts, are so few as to be a negligible quantity? Possibly the British (in Mr. Low's vocabulary the English) scientist will rejoice to learn that the great work of harnessing the Cauvery Falls with electricity for the gold mines has been entrusted to a Yankee company, but to the Yankee it would seem that this financial plum growing on the tree of science should have been plucked by other hands. From a native point of view, it will also be a modified pleasure to learn that owing to their "greater grit, energy, and endurance" the Mohammedans are better than the Hindus in factory work, in which caste-restrictions, too, hamper the latter. But to Hindu and Mohammedan alike it will be a pleasure to hear that they both are so docile to the foreign yoke that in the civil service four members of the ruling race suffice to control every million of its degraded subjects.

Of a different sort, among recently published works on India, is the second, revised, edition of Sir Courtenay Ilbert's digest of laws relating to that country ("The Government of India," Clarendon Press). After an historical introduction follow a summary of the system of administrative law in India, a digest of Parliamentary enactments relating to the Government, the application of English law to the natives, and a chapter on the legal relation between the British Government and the Government of native States. The chief changes made in this edition, as compared with that of 1898, are due to modifications of the Orders in Council relative to the jurisdiction exercised by the Governor-General in council in the native States. In the first chapter, containing the historical introduction, the author draws an instructive parallel between the charter of the East India Company, of 1600, and that of the Massachusetts Company, granted in 1628. The proper distinction, not always observed, between India and British India has been carefully formulated by the author, and should be noted even by general writers on India. "British India" is all Territories, and places within British dominion which, for the time being, are governed through the Governor-General or officer subordinate to him. On the other hand, "India," as legally defined, means British India, together with any Territories of any native prince or chief under the suzerainty of the British Government exercised through the Governor-General of India or officer subordinate to him. British India thus includes Aden, which is not in India (in the geographical sense) at all, while French and Portugese territory actually within India is not included in "India." Despite careful definitions, there are, however, parts of India which can be comprehended neither under "British India" nor under "India." Such are Kathiawar, Cooch Behar, and some districts of Orissa. But the reader must consult Sir Courtenay Ilbert's book to learn the status (not briefly to be explained) of these anomalous territories. Significant, by the way, is the substitution of the word suzerainty for the older "alliance" in the definition above. Finally, it may be remarked that, though the territories of native States are not part of the British dominions, yet "for international purposes, their subjects are in the same position as British subjects."

If not about India, the latest book from the active hand of Col. Sir Thomas H. Holdich, "Tibet the Mysterious" (F. A. Stokes Co.), at least touches upon and in part may be said to embrace India; for as in his other books on the borderland already reviewed in these columns the interest of the author is primarily with India itself. Moreover, Sir Thomas, at the very end of the present volume, rather naïvely shows that the true British spirit regards the Northland as merely waiting to become part of the British domain, and that the land of the Abors is only a stepping-stone to the further north, where rich mines of gold are to be found, as rich as any in the world, and only waiting for England—or shall it be the Great Bear?—to come and work them in scientific fashion. Sir Thomas is only accidentally humorous, yet there is considerable amusement to be had from his pages. But apart from this there is a great fund of information in his book. It seems to be a résumé of all that has lately been written in regard to Tibet and as such is not without value, though we are not quite used to regard the author as a mere compiler. Perhaps we do him a wrong, yet there is nothing to indicate that Sir Thomas is describing what he has himself seen and experienced. But it is no ordinary compiler who has made so rich a collection as this, and the book is crammed with history, anecdote, description, and opinions which altogether make it one of the most readable books on the land of Lamas. None can fail to be interested in the fate of the socialistic schemes of that old monarch who reigned in Tibet in the eighth century, Kir Song de Tsan. After enacting that all men should be equal and that the rich should share their wealth with the poor—not once but thrice he carried this out—it was found that "by the natural force of personal idiosyncrasy" the people returned to their former condition of inequality and the unhappy King had to renounce forever the dream of social unprogressiveness on which his heart had been set. Curious too is the account of the Binbo religion as contrasted with Lhasa Lamaism, though a fuller description may be found in the pages of our American Rockhill. Those who think Chinese soldiers are to be despised should read the story of the conquest of Tibet by 70,000 Chinese, a feat "little short of miraculous." Col. Holdich repeats the old Greek story of gold-digging ants, apparently not knowing that the Greeks merely took the tale as it was given to them by the Hindus. Comparative religion is here enriched with a striking example of the scapegoat-idea (the author seems to think that this phase of religion is to be found elsewhere only among the Jews), and those conversant with the history of northern exploration will be interested to learn the identity of the mysterious K.P., who figures so largely in the records of surveys. The book is marred by repetitions, and in a second edition the author should avoid as poison the iteration, if not the subjects, of tea, dogs, and ants.

From its title one would not guess that the latest volume of the Annales du Musée Guimet, Prof. Paul Oltramare's "La théosophie brahmanique" (Paris, Ernest Leroux), belonged in the category of popular books on India; but it is the *tome premier* of a work bearing the longer title "L'histoire des idées théosophiques dans l'Inde," and the author's purpose is to give a review of the whole history of theosophy in India, not for the Sanskrit scholar, but for the general student of philosophy. Professor Oltramare is already favorably known as an interpreter of Brahmanic thought, and this work, on lines somewhat similar to those of Deussen's more ambitious history of philosphy, will doubtless find many appreciative readers, especially among those not familiar with German. The present instalment begins with an exposition of theosophic thought as expressed in the theory of sacrifice; then, in historical order, it proceeds to the doctrines taught first by the Upanishads and later by the formal schools of philosophy, as far as the latter are represented by the two earlier divisions of Sânkhya and Yoga philosophy.

The divisions of Yoga, *râja* and *hatha*, are explained in full and a final chapter of this first volume is devoted to general considerations leading to the newer phases of philosophy, when it was no longer reserved to the few (the author does not suggest that it was ever esoteric), but became to a large extent impregnated with novel ideas, and faced new beliefs. The survey thus given, if brief, is clear, and seems well adapted both to its purpose and to the circle to which such a work appeals. According to the plan of the whole the next volume should treat of the Vedânta in its various interpretations.

CURRENT FICTION.

The Trimmed Lamp, and Other Stories of the Four Hundred. By O. Henry. New York: McClure, Phillips & Co.

It was not very long ago that "O. Henry" appeared upon the horizon of American periodical literature, to be promptly hailed by the somewhat dubious title of "the new American humorist." To be accurate, he is a humorist in spite of his local color and his cheerful spirit, a humorist after Kikling rather than after Mark Twain. More than once in the present volume he pays a tribute, stated or implied, to the author of the "Plain Tales," and though his characteristic mood is more grim, his style has much of Kipling's terseness and saliency. The range of his humorous sympathy is sufficiently broad to include certain members of the Four Hundred in his present studies of the Four Million. But his interests are with the proletariat (if we have such a thing), rather than the elect. Though his protest against the use of "shop-girl" as a generic term is enforced by his own specifications, he seems to find something peculiarly typical of New York life in the formula of ignorance, sophistication, and complacency which all of his "salesladies" have in common. These are qualities as conspicuous as any, in the mass of our four million. What the newsboy is the shop-girl is; and, as like as not, the thriving merchant and the Wall Street broker. Against all this knowingness "O. Henry" is fond of pitting the frank and breezy idealism of the plains, the cowboy, who makes his shop-girl what he thinks her, and puts aside all her little show of smartness with a sweep of his hand. Here also appear policemen, bar-keepers, confidence men, men about town, and city waifs of all descriptions. None of them is patently introduced to point a moral, or even to adorn a tale. "O. Henry" is actually that rare bird, of which we so often hear false reports—a born story-teller.

Susan. By Ernest Oldmeadow. Boston: John W. Luce & Co.

Here is a farcical little story based on a case of mistaken identity—mistaken by the actors, that is, never by the reader, whose amusement is to be found, if at all, in disentanglement, not in illusion. The success of the book must hinge upon the partiality of all the world for a lover, for complication and for the incongruous, here shown in the flattered, fluttered reception by a lady's maid of honorable addresses from a lord. Then, since all ends well, as it is bound to do in farce, the reader may fairly own to an effortless if not opulent hour. Perhaps nothing in the whole extravaganza is as extravagant as the serious moment and the serious word. The latter runs thus in the letter which tells the truth: "Yes, Beloved, thy mind is beautiful and wonderful. And yet it has deceived you." The former reveals the lady looking at herself in the glass:

> My eyes shone, my hair fell all about me, almost to my knees. In contrast, my feet were like two lilies, my neck was like a swan's.

The Normandy setting and the visit to the little Normandy churchyard show that the writer has a delicate color-sense and can make really charming vignettes of travel. The difficulty is—or the advantage—that the story as well as the scenery is done in water-color.

Reed Anthony, Cowman: An Autobiography. By Andy Adams. Boston: Houghton, Mifflin & Co.

Taking "Reed Anthony" to be Andy Adams himself, we suppose this volume to be simply a further chapter in autobiography. His earlier books about the life of the cowboy and the cattleman have been widely read, not, we suppose, because they are particularly good books, but because they have to do with a picturesque and passing type of American experience. The cowboy and the miner, with the old Southern gentleman, very nearly exhaust our slender romantic treasure, and we naturally make the most of every direct manifestation of them in literature. But Mr. Adams hardly does for the plains what Mr. Bullen and Mr. Conrad have done for the sea. The present reviewer finds his latest book pretty dull; a mass of detail which it is a marvel that any one should have remembered or cared to remember. A great many drives and dickers are described to the last steer and the last dollar for all whom such things may concern. Being Southern-born, the writer has a turn for eloquence as well as for business, and once or twice he gets fairly into the senatorial stride. He looks from a hilltop upon a wide prospect: "It was like a rush of fern-scents, the breath of pine forests, the music of the stars, the first lovelight in a mother's eyes." The pleasant thing about the narrative is its ingenuousness. He has, he remarks, lived in the pit of despair for the want of money, and again, with the use of it, has bent a Legislature to his will and wish. What else, to be sure, is money for? It is a disappointment that there should be so little shooting and gambling, but now and then comes a reassuring anecdote like that in which the cattleman gets even with an enemy who has slandered him.

> I located my traducer in a well-known saloon. I invited him to a seat at a table, determined to bring matters to an issue. He reluctantly complied, when I branded him with every vile epithet that my tongue could command, concluding by arraigning him as a coward. I was hungering for him to show some resistance, expecting to kill him, and when he refused to notice my insults, I called for the barkeeper and asked for two glasses of whiskey and a pair of six-shooters. Not a word passed between us till the bartender brought the drinks and guns on a tray. "Now, take your choice," said I. He replied, "I believe a little whiskey will do me good."

Bud. By Neil Munro. New York: Harper & Bros.

This is one of those old-fashioned tales which serve to pass an hour agreeably without ever raising the slightest question of psychological truth or mastery of craft. A quiet household—two maiden sisters and a bachelor brother—is electrified by the arrival of a child, orphan of a wandering brother married to an American actress. Enter to a small Scotch town "Bud," otherwise Lennox Dyce, a joint product of the vaudeville stage and Chicago! After her advent, if nothing happens precisely as it would in real life, it is equally true that nothing happens as it would in the majority of novels of this calibre. Instead of the aunts being cruel or stupid and trying to suppress this changeling, they treat her with judgment and consideration. Being well to do, they educate her suitably, and put no barrier between her and a successful career. The curtain goes down upon Bud as a ravishing Shakespearean star. Robbed of its context, this sounds a trifle foolish, but clothed with an easy and particularly amiable narrative, the mild picture of the little provincial town is distinctly readable. The author has a taking turn of phrase, as in describing the local drummer "walking on the very backs of his heels," and the Miss Minto who "kept her deaf ear to the sisters and the good one to their brother." Also there is a neat touch in Footles, the dog, who is "really an improvement on the Scotch terrier. There's later patents in him," you might say." Not perhaps a book of solid merit, or dazzling wit, but neither is it in the least dull or in the least pretentious.

Running Horse Inn. By Alfred Tressider Sheppard. Philadelphia: The J. B. Lippincott Co.

Mr. Sheppard has chosen his subject well in taking the ambitious young countryman, disappointed and demoralized by the Peninsular wars. The idea is good, since war has been too often treated romantically, without regard to the real effect of long campaigning upon character. But having a real idea, the author has grasped it somewhat irresolutely. At times he appears not to have made up his own mind how much of a villain George Kennett has become, this doubt strikes you as a wavering of Mr. Sheppard's, rather than as the logical development of George's soldierly vices. Of course, the conjunction of two brothers, the Napoleonic era, one girl, and a rustic setting, cannot fail to recall Thomas Hardy in "The Trumpet Major." But the comparison is unfair to a writer presumably young, and not yet in full possession of his means. The book shows a good measure of careful preparation; the English would be better for a pruning of certain colloquialisms which are unpardonably of to-day. These jar the ear and tend to dispel the atmosphere which he has been at such pains to create. On the whole, interest is fairly well maintained, and among pseudo-historical novels of the moment it ranks where Sir Pitt Crawley's Betsey Horrocks rated herself, when she

candidly remarked; "There has been better ladies, and there has been worser."

Queen Margot, Wife of Henry of Navarre. By H. Noel Williams. With sixteen illustrations in photogravure. Imported by Charles Scribner's Sons, New York. $7.50 net.

Women of the Second Empire. Chronicles of the Court of Napoleon III., compiled from unpublished documents by Frédéric Loliée. Translated by Alice M. Ivimy, with an introduction by Richard Whiteing. New York: John Lane Co. $7 net.

The public is so greedy for court beauties and all the literature of court scandal, that the reviewer must be pardoned if occasionally he places under the same heading two or three volumes which are no more cognate to each other than that they mix up history with more or less dubious gossip. We do not know whether H. Noel Williams pays Marguerite of Valois a great compliment in taking her for a heroine after he has supplied us with equally large and well-illustrated volumes on Madame de Montespan, Madame de Pompadour, and Madame du Barry. On the whole, however, the Queen of Navarre escapes from his hands rather lightly. Any one who buys this book in the expectation of finding it filled with anecdotes that were long since retailed to the world by Bayle and Tallemant des Réaux, will be disappointed. The tone of the present work, if not suggested by the more favorable verdict of M. de Saint-Poncy, seems at least to have derived from it an aroma of charity. To forget La Môle, Bussy d'Amboise, and Chanvallon altogether is not possible, but Mr. Williams must be credited with the desire to keep them in their proper place.

If one is at all concerned to render *convenable* a book on the Valois, it is safer not to stray far from the beaten highway of politics. This Mr. Williams seems to realize, for he dilutes the adventures of Queen Margot very considerably by adding to them the main incidents of French history, so far as it is associated with her life. Almost every one who reads history at all knows Catherine de Médicis and her children so well that an intensive study of Margot's character might have appealed to a wider circle than will be interested in a sketch which, like the present, is half politics and half biography. Her life, whether at Paris, Nérac, or Usson, is a subject well worth attention from all who would have their knowledge of human nature enlarged by familiarity with a type of woman not often found at present in polite society. It requires, however, the touch of a Sainte-Beuve to do justice to a theme in the treatment of which any trace of the banal suggests cheap and tawdry moralizing. Mr. Williams has gone far enough afield in his researches to have come across articles by Georges Gandy in the *Revue des questions historiques* for 1866, but despite this special diligence and an adequate knowledge of sixteenth century memoirs, we have found his book enriched by little illuminating criticism.

M. Loliée sketches the dames who displayed their charms or wove their intrigues at the Court of Napoleon III. The claim made upon the title-page that these chronicles have been compiled from unpublished documents, must be taken with considerable reservation. There are, it is true, some passages in the chapter on the Countess de Castiglione which seem to have come from the inside, but for the most part, M. Loliée has drawn his data from sources quite accessible to other essayists. This is particularly noticeable in the chapter which has interested us most as dealing with the cleverest of the women here depicted—the Princess Mathilde. It is a lively bit of portraiture, but nothing in it suggests command of manuscripts that have been hidden from the public eye.

Matthew Arnold's attack upon the French worship of lubricity often suggests itself when one is reading the memoirs of the Second Empire or the conversation of its salons. This is a factor which cannot be excluded from M. Loliée's book any more than it can be excluded from Mr. Williams's pages on the Valois. One cannot, however, escape a feeling of surprise at the length to which men like Giraud and Jules de Goncourt were able to carry their conversation in the salon of the Princess Mathilde. It is on record that once, when Edmond About overstepped the mark, she ordered the attendant to call his carriage. But this incident is chiefly noteworthy as showing that there was a mark which could be overstepped.

Besides the Countess de Castiglione and the Princess Mathilde, M. Loliée takes up in separate chapters all the leading beauties and adventuresses of the Second Empire. The mere catalogue of their names runs into a formidable list, since after exhausting Madame de Rute, the Countess Le Hon, Pauline de Metternich Sandor, the Countess Walewska, and Sophie de Castellane, one still has to encounter a host of minor personages, like Anna Murat, Madame de Montebello, the Vicomtesse Aguado, and Sophia de la Paniéga. Men and women alike, it is hard to make the companions of Napoleon III. seem like flesh-and-blood people. The Second Empire, considered in the light of its beginning and its end, resembles a night at the theatre much more than it does a chapter from the actual history of Europe. According to the introduction which is supplied by Mr. Whiteing, this book of M. Loliée's "bears a significance as profound as anything to be found in history or in literature. It is philosophy and memoir, court gossip and sad stories of the fate of kings, turn and turn about." This may all be, but to us the volume appears more like "the book of the opera," and a very light opera at that.

Historical Study of the Mother Tongue, an Introduction to Philological Method. By Henry Cecil Wyld, Professor of the English Language and of Philology in the University of Liverpool. New York: E. P. Dutton & Co. $2 net.

Professor Wyld's work does not come into competition with histories of the English language, either popular or erudite, of which there are already many available. Indeed, in the chapters which deal specifically with the development of English, as distinguished from those which embrace matters of more universal application, it merely touches on two of the great branches of grammatical study, viz.: morphology and syntax. It is, as is stated in the subtitle, "an introduction to philological method," in which the English language serves as the basis of illustration. This is an excellent work for post-graduate students in the Germanic languages—especially, of course, English—to supplement the usual courses in historical grammar. The author justly remarks on the serious defect "of many of the best elementary books on the History of English"—the limitation, "elementary," is unnecessary—"that the bare facts are stated, dogmatically and categorically, without any suggestion as to the sources of information or the methods of arriving at the results stated." Many an American student, in Germany particularly, engaged in his first struggle with the standard treatises on the Germanic languages—Sievers's "Anglo-Saxon Grammar," for example—will recognize the truth of this saying, and will welcome such a work as Professor Wyld has put into his hands. For instance, one may even have followed an elaborate course in Old English phonology—at least, this is certainly true of Germany—without ever having heard a definite statement as to the means by which scholars have arrived at our knowledge of the pronunciation of the Old English vowels and consonants, fundamental as this matter is. One is left to gather this information from one's reading or from chance intercourse with the professor. Similarly, one finds in grammatical treatises on every page reconstructed forms of Primitive Aryan or Primitive Germanic, but the student may go long without learning that there are limitations to the absolute value of such forms, and that they "merely record the opinion," to use Professor Wyld's words, "that this or that feature in this or that language is primitive and original."

The work consists of two parts. In the first of these, which makes up about a third of the whole, we have a discussion of the fundamental questions which present themselves in the study of all languages—how sounds are produced, how language is acquired and handed on, the principles which govern sound change, the differentiation of language into dialects, the operation of anology, etc. Professor Wyld's style is distinguished throughout by its clearness, and we have here an excellent account for general comprehension of the results of Paul, Osthoff, and the other standard authorities on linguistics. The second part is historical, and after two opening chapters, which are devoted to the Aryan mother-tongue and the Germanic family of languages, respectively, the author proceeds to the history of English, or rather of English sounds and vocabulary. He does not aim at giving us, however, according to the usual method of historical grammar, a systematic and exhaustive account of the origin and occurrence of each vowel or consonant sound in the different periods. He merely sets forth the general phonetic changes which affected these sounds in the transition from one period to another, and which so led by gradual stages to the English we now speak. On the other hand, nothing is stated "dogmatically and categorically"—the reasons for our conclusions and the limitations of our knowledge being everywhere made plain.

The chapters which deal with present-

day English will be found of particular interest, although it strikes the American reader that Professor Wyld is inclined to vest the teacher with an authority in matters of pronunciation which would be dangerous under our conditions. Constant bibliographical references add very materially to the usefulness of the book.

Borough Customs: Vol II. Edited for the Selden Society by Mary Bateson. London, Bernard Quaritch.

The appearance of the second volume of Miss Bateson's "Borough Customs" serves to intensify the regret that every historical student must feel over her early death. Miss Bateson's first work in the legal history of the English municipalities was published in 1899, and consisted of the first part of the records of the Borough of Leicester. In 1904 she published "Mediæval England" in the Story of the Nations Series, and in the same year appeared the first volume of "Borough Customs," of which the present is the second and, alas! the last instalment. It is a melancholy coincidence that Professor Maitland, to whom Miss Bateson gives so warm an acknowledgment of her indebtedness on the last page of her long historical introduction, died within three weeks of Miss Bateson herself; and thus have passed away both the author and the friendly critic of whom Miss Bateson writes: "The nature and the number of the errors which have been removed by his friendly hand, make it vain to attempt acknowledgment or even thanks."

The plan of the present volume is similar to that of Volume I., and, like it, shows Miss Bateson's chief characteristics—clear perception of essential points, and infinite patience and capacity for sustained research. The work consists of extracts, with English translations where the originals are in Latin or Norman French, from the records of boroughs in England, Wales, Scotland, and Ireland. These are arranged in sections according to the customs they are intended to illustrate, thus allowing the reader to perceive at a glance the likeness and divergence of borough law in boroughs as far apart as London, Sandwich, Bury St. Edmunds, Bristol, Chester, Manchester, and Pontefract in England; Montgomery and Rhuddlam in Wales; Dundee, Linlithgow, and Inverness in Scotland; and Dublin, Cork, Waterford, and Drogheda in Ireland.

This analysis is prefaced by the historical introduction, which occupies the first half of the volume, and in which the customs of the various boroughs are collated, and compared with English common law, which in most, but not all, instances superseded them. In the first volume the subjects dealt with were crime, tort, and procedure. The second volume takes in a larger range of subjects—borough officials, rules of the courts and their officers, bargains and purchases, fairs and markets, the alienation of land, the making of wills and the inheritance of property, relations between husband and wife, alms and oblations, and seamen's law, etc.

There is a double value to work such as this. In the first place, this research into the actual proceedings of the boroughs sweeps away any theoretical uniformity in the development of mediæval law—it does compleat away with the old idea that the legal history of a country may all be learned from the statute books of its central government, or even from a study of the common law which prevailed in the immediate vicinity of the king's court. And, secondly, the work is of even greater value on the positive side, as affording an inductive basis of comparative instances from which the actual beginnings and growth of democratic social life may be arrived at. It shows the people of the Anglo-Saxon race struggling with the problems of government, and arriving at solutions of these problems, differing according to locality and circumstances; but all offering illustrations of the difficulties that had to be met and the methods in which these difficulties were surmounted.

The subjects treated in the present volume are so numerous and diverse that it is not practicable to take any of them in detail. Probably the most interesting generalization that can be drawn from a survey of the extracts is the prevalence of socialistic ideas in the early boroughs of Great Britain. Municipal socialism is often spoken of as though it were a twentieth century, or later nineteenth century development. A glance at Miss Bateson's work would show that it is, on the contrary, only a reversion to earlier ideals and customs—ideals that almost disappeared during the era of individualism culminating in the Manchester School economics. The socialism of mediæval times, however, differed from modern theoretical socialism in that it did not extend its benefits beyond the limits of the borough, and within the borough the privileges secured by borough custom were often limited to burgesses. The "foreigner," whether he came from the next borough, or from over-seas, was under a different régime from the burgess. He was not permitted to share in the bargain or purchase in which every burgess had a right to a part along with the first purchaser. Process and execution for debt were much more severe and summary in the case of the foreigner than in that of the burgess, and in some boroughs, such as Godmanchester, a foreigner might neither buy nor inherit land.

The borough customs as regards married women show very large discrepancies from the convenient common law which after the Norman era simply made man and wife one person, and that person the husband. Many boroughs permitted the wife to hold lands which could not be alienated without her consent, and the rights of the wife to devise property away from her husband were allowed in some boroughs, as, for instance, Lincoln, even without her husband's consent. Ipswich, on the other hand, forbade devise of the wife even with the consent of the husband, if the devise were to the disherison of her heirs. It is, however, in regard to the trading wife or wife-merchant that some of the old boroughs approached most nearly to modern legislation in regard to married women. In France, the old common law allowed a wife who was a merchant in some trade in which the husband was not engaged or which the husband permitted the wife to carry on for their common profit, to sue and be sued as a "feme sole"; and Worcester, Lincoln, Waterford, and some other British boroughs placed the wife trader on the same basis.

It is, of course, to the student of historical law that Miss Bateson's work makes the strongest appeal. The book was not intended for general reading, either in form or substance; yet every lover of the old and curious will find something in it to reward a search. It may be the origin of the old fairy-tale habit of regarding the youngest son as the first favorite of man and nature, which was probably founded on a borough custom that gave the inheritance to the youngest instead of the eldest. It may be the handclasp as a confirmation of a bargain. These and a hundred other old customs gain a new meaning from this study of the borough records.

Science.

The Book of Vegetables and Garden Herbs. By Allen French. New York: The Macmillan Co. $1.75 net.

The books on gardening, of which so many have appeared within the last few years—although there has been a pause of late—may be broadly divided into two classes: those in which advice is sugar-coated with chat and more or less of personal narrative, and those in which useful advice is offered without an attempt to be entertaining and without any pictures for mere adornment. Of the first class, Edith Loring Fullerton's "How to Make a Vegetable Garden" is a good specimen; of the second, this volume by Allen French; his pictures are of purely horticultural interest, and his pages—338 in number—are entirely matter of fact and prosaic, but for that very reason the more welcome to serious gardeners, amateur or professional.

The crops are now all in the ground—except second sowings of beans, radishes, and other quick-growers—but, for those who did not procure the book earlier in the season, it will keep; and it is safe to say that even for this season the reader of it will be able to add largely to the pleasure and profit from his garden, for the author traces the history of garden plants from the cradle to the maw. Here, for instance, are a few lines regarding cabbage, the observance of which may turn probable failure to insured success: "Culture consists in keeping the plants growing by maintaining soil-moisture. A mulch of fresh manure around the plants will do this." Again, are not thousands of households with gardens of their own disappointed every summer because the string-bean season is so short? To prolong it, the author advises the simple plan of cutting back the plants after cropping, and they will yield again later.

Other writers on vegetables have treated them usually in classes rather than individually; Mr. French gives more detailed hints, and under each head he has paragraphs or lines on soil, distances, depth, sowing, thinning, culture, fertilizing, diseases, insect pests, picking, and storing. He agrees with those who consider mulching more satisfactory than irrigating, and there is one line in his preface which, if heeded by gardeners, would reduce the failures in the germination of seeds by one-half; "the row should always be mulched

with the rake after sowing." Space is given to certain vegetables which are too much neglected in this country, such as the globe artichoke, celeriac, cardoon, sea kale, chard, which in Europe are justly regarded as delicacies. Even the carrots are in America grown chiefly for cattle, their finer varieties being entirely unknown Under the head of beans one misses an allusion to the fact that there are now on sale several varieties that are entirely stringless. Their exclusive use by gardeners should be made obligatory by law. There is a hardly justifiable sneer in the line "Some wise man has said that the value of a variety is inversely as the space given to it in the dealer's catalogue." We think, on the contrary, that the leading seedsmen are usually trustworthy in their recommendations, even if an occasional novelty is described in too flowery language.

Rocks, Rock Weathering, and Soils. By George P. Merrill. Second edition. New York: The Macmillan Co. $6 net.

Soils, Their Formation, Properties, Composition, and Relations to Climate and Plant Growth. By E. W. Hilgard. Macmillan. $4 net.

Soils: How to Handle and Improve Them. By S. W. Fletcher. New York: Doubleday, Page & Co. $2 net.

The soil is far more complex than our fathers deemed it to be. Many men discuss it to-day from different points of view: the geologist, the chemist, and the biologist, the physicist, the engineer, and the economist, not to speak of the farmer, orchardist, and landscape gardener. Hence our present-day knowledge is rather heterogeneous because it has been gathered by men who look at the subject from different sides. There are few if any books, in English, at least, which at once adequately and symmetrically cover the general field.

This situation is at once recognized in and illustrated by the three books now under review. One is the product of a geologist's pen. It does not pretend to cover, save briefly during the last tenth of the book, anything but the geological side of the question. The second is written by a chemist, is devoted solely to the soil, and is an exposition of soil chemistry and physics, with geology and biology relegated to the background and economics practically ignored. The third we owe to a horticulturist, who perhaps in his daily life comes closer to the soil than do the other authors. Nearly three-fourths of his work is given over to considerations of soil handling and management, to the practical affairs of soil operations, with geology, physics, and chemistry fairly well recognized, but biology scarcely touched.

But, taken together, these treatises supplement one another very well, and among them soil geology, chemistry, and economics are thoroughly covered; the direct practical teaching desired by the farmer is afforded; while the moisture, heat, and electrical relations receive much attention. But in no one of them are the important biological aspects given adequate treatment. The matter is alluded to, of course, but in each case the brevity of the discussion, the omission of many important matters, and, in Professor Fletcher's popular presentation, serious inaccuracies of statement (such as the classification of the nitrifying organisms under nitrogen fixing organisms, and the reference to "the bacteria in yeast that raise bread by their growth") are to be regretted. Soil bacteriology is still in a state of unsettled development, but its importance entitles it to a more thoroughgoing treatment than it gets in these books.

More specifically, Dr. Merrill's book is an excellent exposition of rock degeneration and soil formation. The first edition has proved invaluable for ten years to the teacher of physiography, in that it more completely covers its special subject than does any other treatise in the English language. The new edition, revised and somewhat enlarged, and even more amply illustrated than its predecessor, will admirably supplement any course in physiography, petrology, or economic geology. Having used it for years, the present reviewer has yet to find it fail him in his classroom needs.

Dr. Hilgard's work contains much of value. His soil survey a generation ago in Mississippi, and his later studies of the soils of the arid and alkali regions are famous. These are accorded due prominence in his book, as doubtless is proper; but they somewhat overshadow other matters of importance. The book is a little heavy for classroom use. It contains a larger number of printers' errors than ought to exist, due, doubtless, to the fact that Massachusetts and California are a continent apart, and that proofreading was correspondingly difficult. Yet, when all is said, there is so much valuable matter packed into its six hundred pages, its author is so well informed at first hand concerning the greater part of what he treats, and it covers so many different phases of soil, that it remains indispensable.

The latest of these three books by Professor Fletcher is written in popular style. The sentences are short and pithy; the polysyllable is noticeable by its absence; the technical terms are replaced by those in common usage. The emphasis is laid, moreover, on soil management, rather than on soils. It is an exposition of tillage, drainage, irrigation, and fertilization, rather than of the formation, composition, biological activities, and physical properties of soils. All this is well worth while for the lay reader. The large print, the easy style, the wealth of illustrations, make it a helpful book. It is to be regretted, however, that the author has in many cases sacrificed accuracy to happiness of statement; that in the avoidance of technical terms and the use of everyday ones, he has not always succeeded in choosing such as were truly synonymous. This has also resulted in superficial treatment in several places. In short, the author's line of work and past training are such that, while they fit him most admirably to discuss certain phases of soil management, they have not afforded him first-hand knowledge in other directions. Had his manuscript been overhauled at certain points by a chemist, and at others by a biologist, it would have been the better.

The severity of the struggle for existence among the young of animals is familiar to all of us, and if we may judge by the enormous number of eggs produced by many fishes, this struggle must be especially severe among forms of marine life. In a recent contribution to the life-histories of the fish of the Cape of Good Hope, Dr. Gilchrist reveals a phase of such a struggle, which the most vivid imagination could not have conjectured. In volume iii. of the "Marine Investigations in South Africa," published by the Cape Department of Agriculture, is an account of cannibalism prevalent among the young of a fish known as *Cataetyx messirei*, which is viviparous and inhabits the deeper parts of the sea. The two ovaries consisted of bright red eggs, and near these were a number of larvæ coiled up in a dense mucous substance. When examined closely, the larger larvæ were each found to have swallowed and partly digested one of their smaller brethren! The poor young fish have a bad enough time after they are hatched in avoiding the thousand and one dangers of their environment, but to have added to this the chance of being swallowed by brother larvæ before they have actually been born is surely the survival of the strongest carried to the least common divisor! Another fact of great interest brought out in the course of these investigations is the occurrence of blue pigment concentrated in cellular elements—in chromatophores, abundantly developed on the dorsal surface of the saury-pike.

Drama and Music.

John Bull's Other Island and Major Barbara. By Bernard Shaw. New York. Brentano's.

This latest issue in the series of Shaw publications is a good deal more imposing in bulk than it is solid in substance. It contains three plays, "John Bull's Other Island," "How He Lied to Her Husband," and "Major Barbara," and two highly characteristic prefaces which are worth reading, for the amusement that is in them and for the exposure which they make of Mr. Shaw's mental processes. "John Bull's Island," or the greater part of it, has been played in this city, and abundantly discussed. Further reference to it at this time is therefore unnecessary. Of the "Preface for Politicians," with which it is now supplemented, it can only be said that if it does not cast much new light upon the play it exhibits very clearly and disastrously the qualifications of the author for writing it. "How He Lied to Her Husband" is a trifle which owes the honor of publication to present convenience rather than to any special merit of its own. It fills a gap in the middle of the volume. "Major Barbara" is the Salvation Army piece which ran for some time in London, but has not yet found its way to the New York stage. As a study of actual social conditions, or as drama, it is quite worthless, being wholly unreasonable and packed, as is the writer's habit, with all kinds of false and reckless generalizations, cynical extravagancies, and perverse misrepresentations, but is, nevertheless, highly entertaining in its witty, bumptious, paradoxical and wholly irresponsible fash-

ion. It reveals also many flashes of keen and humorous observation, and is by no means devoid of profound, if only too obvious truths, but these are apt to be mixed so inextricably with every variety of crazy theory that they are perhaps more mischievous than flagrant falsehoods. His "First Aid to Critics," offered by way of introduction to the comedy, is a piece of gratuitous impertinence, often written in execrably bad taste, and is prompted chiefly, apparently, by a desire for advertisement which it would be stupid to gratify.

"The Ranger" is the name of the new play which Augustus Thomas has written for Dustin Farnum. It will be produced at Wallack's on the 2d of September. The scene is laid on the far side of the boundary line between the United States and Mexico, and the presumption is that the central character is nearly akin to the one in which Mr. Farnum won his first great popular success. If this is so, it is a pity, for Mr. Farnum is one of the few young actors generally believed to possess abilities worthy of development.

John Hare will begin his farewell tour of the English provinces on the 30th of September. He will be seen in "The Gay Lord Quex," "Caste," "A Quiet Rubber," and "A Pair of Spectacles." The date of his final retirement from the stage is, however, still uncertain. There appears to be little doubt that be will appear in a prominent part when Mr. Pinero's new play is produced in London. If this should prove a great success, it is probable that his leave-taking of the public will be postponed indefinitely.

One of the most striking productions in connection with the Irish Theatre seems to be a little one-act tragedy, "The Gaol Gate," by Lady Gregory, which was played recently in the Queen Street Theatre, London. It has been called "one of the few tragedies of what for convenience we may call low life which have any dignity or grandeur."

It has long been a matter of pride for this country that it was an American, A. W. Thayer, who wrote the acknowledged best life of Beethoven. Unfortunately, he was able to finish only three of the requisite four volumes. After his death, in 1897, the task of completing his work was taken up by Dr. Hermann Deiters. Now comes the announcement of his death; he, fortunately, had nearly completed the fourth volume. So far the Thayer biography has appeared only in the German version made by Deiters. It is to be hoped the original will be printed.

The most eminent clarinet player of the period, Richard Mühlfeld, is dead. Brahms admired him so much that he wrote for him the clarinet quintet in B minor; and when this quintet was first given in England Mühlfeld was imported for the occasion. His tone in the lowest register was uniquely beautiful, but what made Brahms and others admire him most was the "glorious breadth of his phrasing." Since 1884 Mühlfeld had been a member of the Bayreuth orchestra, and there are passages in "Parsifal" which he played with incomparable art.

Budapest is to have a new music hall, or musical palace, as they style it. It will be built in an open place which has been called the "Franz Liszt Platz," and the chief decoration of the façade will be a bronze statue of Liszt. The concert hall will seat 250 performers and 1,500 hearers.

Art.

A History of Architecture. By Russell Sturgis. Vol. I., Antiquity. New York: The Baker & Taylor Co. To be completed in 3 vols., $15.

Among many signs of the growth of popular interest in architecture in the United States, the most significant is the development of a group of American writers on architecture who, though still few in number, have done some excellent work. Among these Mr. Sturgis holds by general consent the first place, by reason both of the amount and the quality of his literary product. The appearance of the first volume of a history of architecture from his pen is therefore an event of no small interest, the more so because it aims to fill a long-recognized void. Twenty-five years ago, Fergusson's "History of Architecture in All Countries" was law and gospel for the English-reading public; but the advance of scholarship and criticism has left that notable work behind, and nothing had appeared to fill its precise place until, about eighteen months ago, Longmans, Green & Co. published the first volume of a three-volume "History of Architectural Development," by Prof. F. M. Simpson of University College, London. Mr. Sturgis's volume, following a year later in the same field, but conceived on an ampler scale, is apparently addressed to a somewhat different public, and it may prove that the two together will be required to fill the gap left by the gradual stranding of Fergusson's classic history. The great merit of the older work was its happy blending of the technical and the popular; architects and laymen found it equally interesting and informing. Mr. Sturgis's "History of Architecture" is evidently intended less for professional than for non-professional readers; it is at once less concise and less technical than Professor Simpson's book, covering in its 425 pages only about two-thirds of the ground surveyed by the English writer in 256, and illustrated in a less systematic but more popular fashion. Mr. Sturgis has in earlier works, and notably in "The Artist's Way of Working," shown his ability as an expounder of the principles and technic of the arts in a manner which appeals to the general reader, unversed in technicalities, and indifferent to dates, scale-drawings, and the intricacies of style-relations; and it is doubtless to the desire to interest such readers that we must attribute the somewhat easy-going and discursive treatment of his theme in this volume. To write the ideal history of architecture is no easy task. Perhaps the nearest approach to it is Choisy's; but that is in French.

The present volume covers the architecture of antiquity down to the fall of Rome, but without including the beginnings of Christian art. Three chapters are given to Egypt, four to Western Asia, ten to Greece, one to pre-Roman architecture in Italy, and seven to Roman Imperial architecture. Of the 336 illustrations 80 are devoted to Egypt and Western Asia, 123 to Greece, 133 to Italy and Rome. Counting the pages 114 go to the Orient, 153 to Greece, 158 to Italy and Rome. This division shows the author's indifference to mere archæology; the chief attention is bestowed upon the splendid architectures we call classic; and with reason, in a history written for the general public rather than for scholars. In the large relative space given to Greek architecture, Mr. Sturgis follows both his own evident prepossession and that of most non-professional readers, who care less for the Roman than for the Greek buildings. Architects, on the other hand, are apt to find more that is vitally interesting in the Roman architecture, because of its endless variety and flexibility, its marvellous construction, its superb planning, and its expression of power and magnificence. The cold perfection of Greek architecture, the narrow range within which it achieved that refinement of perfection, and its limited powers of expression deprive it of the suggestiveness and inspiration which the architect feels in studying the great masterpieces of Roman building. Mr. Sturgis is an architect, with a number of excellent buildings to his credit; but his attitude towards Greek and Roman architecture is that rather of the painter or the dilettante than of the architect.

Roman architecture, indeed, even in the 145 pages devoted to it, hardly gets fair treatment. The author evidently shares the common literary dislike of it; he is intolerant of the decorative use of the orders, and of the Roman arch flanked by columns, and pursues it with such phrases as "sham columns, make-believe entablatures," "complete negation of significance," and like expressions (pp. 301, 304). He denies originality to Roman architects (p. 385), and bestows scant praise upon the marvelous planning of Roman public buildings or the remarkable system of carved ornament developed by the Romans. When one considers that the Romans were the first to conceive the sublime effect of vast and lofty interiors unencumbered by supports, and then compares a plan like that of Trajan's Forum or Caracalla's Baths with the elementary planning and construction of Greek buildings and groups, it is hard to understand how so mature and scholarly a critic as Mr. Sturgis could say (speaking of the Temple of Venus and Rome): "Now all this, except the building in mortar masonry and the idea of a vault, might have occurred to a Greek. . . The Romans have little claim to originality *as builders or as makers of plans* (the italics are ours): what they knew best was how to appropriate the the ideas. . . of the Mediterranean world" (p. 385). On page 339, he speaks of "that deliberate copying of Grecian building and of Grecian thought" in Roman columnar architecture: whereas neither in its building nor in its thought does Roman architecture owe any but the slightest debt to Greece.

There is evident in these reiterated depreciations a fixed prepossession against the Roman genius, in spite of sporadic commendations, sometimes enthusiastic, which the artist in the author could not help

paying to an art which was distasteful as a whole to the critic. On the other hand, the chapter on arcuated buildings is entirely interesting and particularly full and informing in its discussion of the Roman arches of triumph. The Roman stuccoes elicit, in Chapter VII., delighted admiration, and there is not one of the seven chapters but contains happy characterizations, penetrating bits of analysis, shrewd and suggestive *obiter dicta*, and lucid explanations of technical matters. The pleasure one experiences in reading such passages makes one regret the more the lack of sympathetic appreciation in so many others.

Greek architecture Mr. Sturgis discusses *con amore*. The discussion is not very systematic in arrangement, but it is full and free, sympathetic and discriminating. One feels throughout the thorough scholarship underlying it: but nowhere is archæology obtruded or documents referred to for the sake of the mere aspect of learning. Disputed questions are not made prominent, and when alluded to are briefly discussed without controversial dogmatism. The style is familiar, discursive, almost colloquial at times; too full, occasionally, on points which interest the author, for the requirements of correct proportion. Thus the Theseion occupies in all sixteen pages, the Parthenon but four. The Temples on Ægina and on Cape Sunium are hardly or not at all mentioned. Like omissions occur in the two chapters on Egypt. The Ramesseum is barely mentioned; the splendid tomb-temple of Queen Hatasu at Deir-el-Bahari, and even the great temple of Luxor, are not so much as named. But it is by precisely such omissions that space is obtained for the freer discussion of those aspects of the art which are of wider appeal to the lay mind.

The book is a handsome, rather heavy volume, printed on thick paper, not too glossy, with double-leaded lines pleasant for the eye, and is marked by careful proof-reading, which has left a very minute residuum of errors to reward a pretty careful scrutiny. One error—hardly to be explained by careless proof-reading—is the reference on page 284 to the temples of Edfu and Denderah as "monuments of a time only just preceding that of Diocletian." Edfu dates from 247-222 B.C.; Denderah from about 40 B.C. It is difficult also to account for the various forms in which identical names appear, as Selinus and Selinunte. Segesta and Egesta; Souweida (Soueideh) and Sermeda; and for the use of the Italian forms Pesto, Metaponto, and Girgenti, in preference to the more familiar Anglo-Latin forms, Pæstum, Metapontium, and Agrigentum. Despite these minor blemishes, the work is plainly the fruit of careful scholarship, accurate in all its specific information, and usually sound in its analysis and criticism. It ought to be of real service in the stimulation of public interest and the training of public taste.

The purchase by the Metropolitan Museum of Art of some examples of sculpture by Dr. William Rimmer has revived interest in a man who has never quite enjoyed the fame due him as a sculptor. He was born in 1816 and died in 1879. He passed most of his life in Boston and New York, where he made for himself a reputation and is still remembered by many. He took up the practice of art after studying medicine and taking his doctor's degree, which gave him an unusual knowledge of anatomy. This he put to excellent use in his work, which is characterized by a fine appreciation of the human body. He early came under the influence of the Greek and Roman sculpture which he went to Rome to study. One of the results of this visit was his figure of "The Falling Gladiator," which was very much discussed in its day. He formulated a course of lectures on anatomy, which he gave to public classes in Boston, New York, and many of the secondary towns of the Northeast for sixteen years. These lectures were later collected and published, with his fine drawings, in 1877, and still comprise the only work on the subject which has any true artistic value.

The American Art Society of Philadelphia, which has been granted an appropriation by the Legislature of $7,000, covering two years, announces an exhibition of paintings to be held at the Haseltine Art Galleries, No. 1822 Chestnut Street, beginning October 14, and lasting one month. Invitations are being sent to all the leading art patrons of Philadelphia and other cities, and a large attendance is expected. Correspondence from artists is requested, whether members of the society or not. There will be an award of gold, silver, and bronze medals to the best pictures.

The seventh centennial anniversary of the famous Sängerkrieg on the Wartburg and of the birthday of the "holy" Elizabeth are to be celebrated this summer in Eisenach by an exhibition of the productions of the German artists from the age of Elizabeth to the close of the Middle Ages. This exhibition will be in charge of Prof. Georg Voss, conservator of the art treasures of Thuringia, and is to illustrate particularly the life and the arts in the period when the knighthood and the poetry of the Germany of the Middle Ages were in their most flourishing condition.

"A Guide to the Paintings in the Florentine Galleries: The Uffizi, The Pitti, The Accademia" (E. P. Dutton & Co.) has been prepared by Maud Cruttwell. There are numerous small reproductions of the pictures, together with brief characterizations. The recent changes in the Florentine galleries render a new work of this sort highly useful.

Frederick Warne & Co. announce two new volumes, "Sir Thomas Lawrence" and "Sir Henry Raeburn," to be added to Newnes's Art Library in the autumn.

Finance.

Frank A. Vanderlip has brought together in one volume ("Business and Education," Duffield & Co.) fifteen articles and public addresses written upon various occasions during the last eight or ten years. Five of them deal with problems of commercial and industrial education, in which the author's interest has been enlisted in various practical ways. Four others treat of currency and finance, topics concerning which he speaks with no little authority. The rest touch upon a variety of subjects—old-age pensions, American foreign trade, our industrial future, and the like—for the most part in a desultory and unsatisfactory way. Not every man who achieves success in a business career is thereby qualified to write upon "Political Problems of Europe as They Interest Americans"; and passages like the following are drearily commonplace, by whomsoever they may be written: "Man's labor the world over is steadily decreasing in importance. It is the age of machinery. The forces of nature are to do man's work. All the world over the cost of production has fallen. The relative importance of labor in the cost of production is lessening; the sway of machinery is increasing. The twentieth century will be the century of machinery." We would not gainsay the right of successful business men to their literary diversions, but will venture the delicate suggestion that not every article contributed to popular magazines needs to be reproduced in more permanent form.

In the mass of writing upon railroad questions, it is difficult to find anything of value that approaches the study of the industry from within; nearly all writers have concerned themselves with the relation of the railroad corporation to the State. This is doubtless to be explained by the fact that those who have had the ability and the inclination to put the situation into print have lacked the knowledge, while those with adequate information—the practical railroad men—have had no inclination to talk about their business, or have been without the art of placing the situation clearly before the public. We can but welcome then Logan G. McPherson's "Working of the Railroads" (Henry Holt & Co.), as a modest attempt, distinctly successful within its limits, to explain the operation of an American railway. It is primarily descriptive, and takes up in order and in the form of lectures such subjects as construction and operation, traffic, accounting, and financial and executive administration. A particularly informing chapter is that entitled "Correlation," which describes in detail the routine procedure involved in the running of trains. The concluding chapter on "Relations to the Public and the State" favors the punishment of railways for their rebating sins, but is opposed to such restrictive legislation as interferes with their freedom. The author has drawn his material from his own observation while in the service, and his later academic experience has doubtless given him his power of clear presentation.

Kropotkin's "Conquest of Bread" (G. P. Putnam's Sons) is a translation of a work which was originally published at Paris, in 1892. It is devoted to an exposition of the particular brand of social revolution—anarchist communism—with which the author's name has long been associated. He is persuaded that, with every vestige of legal compulsion removed, men would readily associate themselves in "free agro-industrial communes," large or small, and order production and distribution upon a rational coöperative plan. Those familiar with his other works know that he makes out as plausible a case as it is possible to present for a preposterous proposal; but the present volume really adds nothing to

what he has said elsewhere, and it is hard to understand why it has been brought out in American dress.

ALICE-FOR-SHORT

By WM. DeMORGAN, author of "JOSEPH VANCE" ($1.75)

The Nation says: "This is Dickens, that is Thackeray, yonder is a hint of the Du Maurier stepping-stone . . . there is no manner of doubt as to the school to which this new-old craftsman belongs; the important fact is that he belongs to it, and does not merely hang upon its heels. 'Alice-for-Short' is sure to retain for its author the friends which 'Joseph Vance' made for him."

HISTORIA AMORIS

A History of Love, Ancient and Modern.
By EDGAR SALTUS.

The Nation.

NEW YORK, THURSDAY, JULY 11, 1907.

The Week.

The first report of the National Civic Federation is pretty strongly adverse to the principle and practice of municipal ownership. An exhaustive investigation of the subject was made in Great Britain and the United States. Highly significant are the facts reported by J. W. Sullivan, of the Commission, regarding the effect of municipalization upon labor. It appears that, except in the most poorly paid forms of employment and upon tramways, the wage has not been raised above that of workmen in private concerns. Municipal ownership is declared to be favorable to the "open shop"; for public appointments must be possible to all citizens, and Government regulations must be superior to those of the union. Consequently, when union men obtain municipal employment, they frequently decline to pay their dues to the union. There is a certain grim humor in Mr. Sullivan's statement that "in America the municipalized enterprises have been rich mines for significant facts relating to politics, rather than to labor." Prof. J. R. Commons of Wisconsin University, who was also on the Commission, is more favorably disposed towards municipal ownership, and advocates the recognition of organized labor by the municipal enterprise. But this would mean not municipal, but union, control. In any case, municipalization does not promise to give to the workingman that Utopian paradise which its supporters have prophesied.

The Philadelphia *North American* has summarized the results of the three months' inquiry of the committee which has been investigating the construction and furnishing of the Pennsylvania State Capitol. It has been shown that of the $13,000,000 expended, at least $5,000,000 was wasted in graft. It has appeared that the architect, Joseph M. Huston, absolutely dominated all State officials on the Capitol Commission and the Board of Public Grounds and Buildings, from his appointment as architect in 1901 until the exposure of the fraud, and that he scandalously betrayed his trust. Gov. Pennypacker, who is probably as honest a man personally as ever held office, trusted everything to Huston in a way which certainly lays him open to very severe criticism for his "innocent connivance with wrongdoing." So busy an official as the Governor should, of course, never have been on such a commission, but once he was there it was his duty to know what was going on. No direct evidence has been produced of political partnership with the grafters except the testimony of S. Marshall Williams, an unsuccessful bidder, who swore that $10,000 had been paid him as hush money—it is thought by Congressman Cassel, who may have been acting for the State leaders. All the State officials concerned have testified to their innocence, their failure to profit by the jobbery, and have denied any arrangement with the political leaders to divide profits. But, says the *North American*, "Their explanations both as to the letting of the metallic furniture contract to Cassel and in the subsequent handling of the Sanderson bronze furniture contracts and their carrying out, are contradictory, mutually incriminating, and direct evidence exists convicting certain members of the boards of guilty knowledge of gross irregularities from the start." No checks were put upon any expenditures until the reform wave in Pennsylvania had elected W. H. Berry State Treasurer. Then all of the amounts due on the fraudulent contracts were hastily paid before Berry took office.

The most mischievous form of sensationalism is the glib prophecy which many public speakers like to indulge in whenever important diplomatic questions are pending. However irresponsible these orators may be, their words are telegraphed to all quarters of the globe, and serve to excite the ignorant at home, and make a false impression abroad. The other day, a retired general of the army, Oliver O. Howard, said that Japan could not "whip us," provided Great Britain remained our friend; and a rear-admiral, returning from the East, predicted "war with Japan within five years." At the American dinner in London, Mr. Reid referred to "the perniciously industrious diplomacy of these later times" as a cause of international difficulties. But the fault does not lie wholly with diplomacy: it is in evidence in extra-diplomatic circles when perniciously industrious persons kindle a fire which they have not the power to put out.

The beginning of legislation in the South along social lines was remarkably illustrated by the record of the last North Carolina Assembly, which voted money for schools and institutions in a really lavish way. Primarily, $500,000 was granted for an institution for mental defectives, idiots, epileptics, insane, etc., curable or incurable. Next the Legislature paid its attention to sufferers from tuberculosis, voting $5,000 for a tuberculosis ward at Morganton, and $15,000 for a State tuberculosis sanatorium, which is to receive $5,000 annually. County commissioners, by another statute, are now required to separate tubercular prisoners from those in good health in all prisons and detention camps. The child labor law was strengthened by prohibiting night work for children under fourteen, and raising the age limit to thirteen for the illiterate. Next, a tentative compulsory school attendance law was also put on the books, excepting, it is true, some counties, but enabling the others to apply it when certain that public sentiment is ready. The Assembly's interest in the schools did not end there. Provision was made for a system of high schools for such counties as wish them; an eastern training school for teachers and a school of technology along original lines were established, while the financial grants to the State University and colleges were largely increased. Finally, a reform school for delinquent children, called the Stonewall Jackson School, has been begun, and its management placed in the hands of women. Of course, these votes bespeak the growing prosperity of North Carolina, as does the increase of Confederate pensions from $275,000 to $400,000. But more than that, they illustrate clearly the great change that is coming in the attitude of the South towards social questions from the legislative standpoint.

In upholding the "Jim Crow car" laws of the South, the Interstate Commerce Commission falls back upon previous rulings by members of the Commission and upon a decision of the Supreme Court. It is, Commissioner Lane holds, no discrimination to separate blacks and whites when equal accommodations are afforded both races. In the particular case before him, the railroad had discriminated in that it did not furnish a wash-bowl and towels and a smoking compartment for negro passengers. With these oversights remedied, the Commission feels that there is no discrimination left; that to put all black persons into one car and all whites into another is perfect equality in the good old American sense. Under this decision, any railroad will in the future be justified in marking certain cars, "For Jews only," others "For Chinese and Japanese exclusively," and still others, "None but Dagoes may ride here"—and our learned commissioners, on gravely inspecting to see that each coach had the same number of towels and washbowls, would declare that they could find no discrimination of any kind. As

a matter of fact, they have done their best to help create classes in this democracy—a white class and a black class. As men of intelligence, they know perfectly well that nowhere in the South are the Jim Crow accommodations equal to those given to the whites, either in cleanliness or sufficiency. The railroads simply decline to "clean cars for niggers," knowing them to be not, as the Commission pretends, on an equality, but grossly discriminated against, and unable to protest efficiently by reason of their being deprived of the ballot.

Rhode Island has cause for rejoicing in the resignation of Boss Brayton from the executive committee of the Republican State Central Committee, as a preliminary step towards retirement from political life. After thirty years of devoted service to party and pocket, this unselfish patriot lays down his sword, wraps the mantle of virtue about him, and bids the torch be handed on to "younger and abler" hands. Why linger further in an age and among a race that would not have Colt for United States Senator? The historic ingratitude of republics drives the Boss from his office in the State House, which was so long a home to him. The fall is tragic, and yet Rhode Island can scarcely be blamed for yielding to the spirit of the time and seeking her own purification. Like Delaware, she has shown that even if the small State may be more easily captured by the political brigand, there are limits beyond which audacity cannot go. Evidently the wave of reform has not yet spent its force, and the name or title of boss is still odorous in the land. One by one the pillars and ornaments of an old system are disappearing. Addicks, Lentz, Ruef, Brayton, Odell—it is a muster roll of the dead. Only our own Platt still clings pitifully to the throne of place, if not of power, faithful to the end—and to himself.

No good American could possibly have escaped a thrill of gratitude towards John D. Rockefeller for his gracious kindliness towards his country. He bears no resentment against these United States for sending a number of marshals to secure his presence in Chicago, nor against Judge Landis for trying to live up to his duties as a member of the Federal judiciary. He is only sorry that the deputy marshals, in their youthful enthusiasm, should have thought they could really get him if he chose to keep out of their hands; and he can only pity Judge Landis for thinking that a Rockefeller could be made to tell on the witness stand anything he preferred not to tell. Why make all this bother, then, in the case of a harmless old man who really doesn't know anything about Standard Oil, except that it comes out of the ground and is taken care of by Archbold, Rogers, and Pratt, and who lives even as the sparrow, receiving with unquestioning faith his twenty millions yearly without inquiring whence they come, or why?

The Cosmopolitan Society, which has been organized in Brooklyn by members of various nationalities and races, for the purpose of promoting good feeling between such races and opposing the exploitation of any one by any other, is a little out of the general category of associations formed for serious purposes. It has the admirable object of interesting itself at once in the anti-Japanese crusade and the Jim Crow car movement. To be consistent, the Italian and the Jew must also come under its sympathetic concern. It will be interesting to see how long such a body can maintain its existence without subordinating its ideal of the parliament of man to some particular issue. It is the general opinion of those most experienced in forming leagues, we believe, that it is unwise to hitch a wagon to more than one star. Yet the gain in efficiency and unanimity may sometimes be offset by a loss in real influence. Advocates of this or that special measure are incessantly trying to secure favorable expressions of opinion from the permanent bodies that are not formed for one special kind of propaganda, and command the more influence for that reason, like the Chamber of Commerce, the National Board of Trade, and, preëminently, the great political parties.

Professor Münsterberg has returned to Boston after spending four days at Boisé, where he studied the mental characteristics of Orchard. While the professor has not yet made a systematic report of his observations, he has given some account of his visit to the Boston *Transcript*. It appears that Orchard has "brutal lines from forehead to chin," that the lobes of his ears, his retreating forehead, and glittering eyes proclaim him a degenerate. He has a remarkable memory, and speaks the truth. Every facility was offered to Professor Münsterberg for making his investigation. The Governor of Idaho himself introduced him to the prisoner. But unless more interesting results than those reported are forthcoming, it would seem that the eight days spent in travelling between Boisé and Boston were, scientifically considered, so much time wasted. Professor Münsterberg thinks that in the future the psychological expert may have an important place in courts of justice, even as chemists, physiologists, and alienists have now. But to admit psychological expert evidence in most trials would open the door to every sort of charlatanry. The cry to-day is not more, but fewer, experts.

Professor Garfield's election to the presidency of Williams College, in succession to Dr. Hopkins, whose resignation will take effect next year, has a significance more than personal. He will be the first layman to be at the head of Williams. His clerical predecessors filled chairs of "Christian Ethics" and "Natural Theology." Professor Garfield has been a teacher of law, a lecturer on political science and the whole democratic movement. To make such a man as he president of Williams is as violent a break with tradition as was the choice of a professor of economics for the presidency of Yale, or an historian for Princeton. Yet it is precisely men of the Garfield type to whom college trustees are now looking. When to broad training and wide experience of the world and acquaintance with educational methods, one unites vigor and genial address and practical capacity, fitness for the presidency of a college does not depend upon the further question whether one is a clergyman. Going back to an institution with which his father's name is indissolubly connected, Professor Garfield will enter upon a large opportunity.

The "Mikado" opera question is still agitating the British public. Joseph H. Longford, whose service in Japan as British consul at various places extends over thirty-three years, writes to the London *Times* that, twenty years ago, the Japanese were scarcely known in England, and no one thought of paying the slightest attention to them, while visitors from Japan hid their feelings in silence. Circumstances have changed completely, and to-day we can estimate how the Japanese must receive the knowledge that "the English people have publicly burlesqued in the most offensive manner" their sovereign, who is also a spiritual head, like the Pope, from "the spirit that has been aroused by the incomparably less humiliating affront which has been offered by the people of San Francisco." Mr. Longford relates an incident to show how the Japanese themselves acted in a similar case. Over thirty years ago a theatrical company produced a drama which included a burlesque of the Crucifixion. Sir Harry Parkes, British Minister at the time, remonstrated informally with the Japanese Government, and the drama was at once prohibited.

At a university settlement meeting in Manchester, England, Mrs. Humphry Ward spoke on the "Needs of City Children for Play." It is important that places should be set apart where they can amuse themselves during their leisure hours; otherwise they spend their time in the streets, and quickly fall into vice and crime. Such places are the more needed because the homes of

many children are so unfit. "They go, perhaps, into the midst of drunken fights, where they may be knocked about, and they cling to the play-centre." Mrs. Ward dwelt also upon the necessity of directing the play of the young, in which she said New York set an excellent example. Yet many of the English towns are better organized for carrying on this good work. In some there are not only play-centres, but industrial schools in which the children are amused, and learn how to gain a livelihood. In this city, the opening of the public school buildings for play during the summer vacation has been a great boon, especially to those who live far from any park or open square. The school houses are cooler and cleaner than the street, and the *morale* of the children can be attended to better when they are gathered in one place. Yet, after all, it is a barren substitute for the real country.

The result of the Parliamentary election for the Jarrow division of Durham, which was looked forward to with much interest as a possible index of the effect of the Nationalist revolt on the fortunes of the Liberal party, has turned out a surprise. It was thought that the defection of the Irish vote would be sufficient to give this Liberal stronghold to the Unionists, who in the last election did not even contest. As a matter of fact, the poll is headed by a Laborite, with a plurality of nearly 800 over the Unionist candidate, who in turn led his Liberal opponent by nearly 500 votes. Some 2,100 votes were cast for the Nationalist candidate, or 1,300 less than the Liberal strength. The curious feature of the election is that the total number of votes cast, 13,926, is about the same as that polled in January, 1906, when the Liberal candidate received 8,047 votes, against 5,093 for his Laborite opponent. An analysis of these figures would seem to show that the cut in the Liberal vote to less than one-half is not so serious as would appear. In 1906 not improbably a large percentage of the Unionists voted for the Liberal candidate against a professed Socialistic candidate. This year they have returned to their party. Actually, the Government has not suffered a very severe blow, since the Labor party, as far as the Liberal main programme is concerned, is still its ally. On the other hand, it seems doubtful whether the Nationalists, in any English seat, will be able to swing the balance in favor of the Unionist party. The Labor party, by nominating an Irish candidate—Peter Curran is the successful candidate from Jarrow—should always be able to capture a goodly portion of the dissident Nationalist votes.

Discontent with British rule in India is now reported to be assuming the form of secret military organization and drill preparatory to armed insurrection. Yet it is not with such comparatively tangible acts of disloyalty that the authorities should find it most difficult to cope, as with the vast religious and social agitation. Repression, though unpleasant, is at least comprehensible and natural in the face of rebellion. But how, in the present state of feeling in India, can the Government venture on suppressing meetings or forbidding acts and ceremonies which are by nature religious and intimately bound up with the innermost life of the people, without precipitating a crisis it must be anxious to avoid? We have spoken before this of the grotesque mixture of Occidental and Asiatic methods and ideas which the anti-British movement in India, and particularly in Bengal, shows. The commercial boycott and the school strike, as practised in Europe, are very well understood. The press is clever in avoiding the penalty of the law while preaching what the authorities consider sedition. There seems to be no want of trained speakers and organizers. But to further the sentiment of unity among the natives we have one leader recommending "the formation in every town and village of organizations for the performance of the Rakshi Kali pooja (blood sacrifice) every Amabashya night. With drums, torches, music, and fireworks vast congregations should assemble and sacrifice 101 white living goats." A combination of Eastern fanaticism and European weapons is what may confront the British Government.

Italy, which is beginning to feel the drain of her enormous emigration but finds it difficult at the same time to adopt a policy of absolute restriction, has done the next best thing by taking steps for facilitating the homeward flow of men and money from across the seas. In the discussions on the new emigration bill now before the Italian Parliament, it was pointed out that remittances from emigrants to their families at home were decreasing, and remedies were suggested in the form of reduced postal rates and improved facilities. To encourage Italians abroad who have acquired some wealth to seek repatriation, it is provided that the laws of citizenship be so modified as to make re-naturalization possible after a simple renunciation of foreign citizenship, or result automatically after a three years' residence. A news dispatch the other day quoted one Italian immigrant as coming to this country for the purpose of saving up ten dollars with which he might return home and purchase a cow. The speaker's vision will undoubtedly broaden with his first day on our shores, and when he goes back to Italy it will be undoubtedly with many times fifty lire, and the determination to take his place among the new class of small proprietors which is coming to constitute an important factor in the social life of Italy.

Italian anti-clericalism has just had its innings with the capture of the Roman municipal administration by the Radicals. The Catholic party in Italy is described as having a splendid organization, while their opponents have been weakened by factional strife. The present triumph of the anti-Catholic party was undoubtedly due in great measure to the profound dissatisfaction aroused by the recent policy of the Government in repeatedly giving official recognition to the dignitaries of the Vatican, and manifesting its good will for the Church in other ways. About two months ago the country was greatly stirred up because military honors were accorded to the newly created Cardinal Lorenzelli, on the occasion of his formal entry into his see of Lucca. About the same time Cardinal Cassetta was honored with a gun salute by an Italian man-of-war, and the cardinal patriarch of Venice, on presenting himself before the King during the latter's visit to the city, received precedence over all other officials, together with military honors due to a prince of the blood. More irritating to anti-clerical opinion has been the growing participation of the troops in religious fêtes and processions.

China's determination to be modern and Occidental is showing itself in more ways than one. In preparation for a representative form of government, which seems to be drawing nearer, Chinese students have apparently mastered the art of throwing bombs. If any striking evidence of the solidarity of the world is desired, it may be found in the rapidity with which the most backward nations have come to adopt modern means of political and revolutionary agitation. The boycott, the school-strike, the hunger-strike, are practised with commendable skill by Persians, Hindus, and Chinese. Now comes the use of explosives. The Chinese have undoubtedly learned from Russian exiles in Japan and in Mongolia. It is interesting to know that there is an appreciable Socialistic literature in Chinese, created for the most part by the aforementioned Russian exiles and refugees. Very probably, Russia's thousands of prisoners in Japan, among whom must have been numbers of discontented liberals and professional agitators, have supplied a certain impetus to the Socialist movement in the Mikado's Empire, whence in turn some of the ten thousand young Chinese students now studying in the Japanese universities bear the torch of progress or of revolution to their own shores.

WORKING UP A WAR.

The old journalistic recipe for inflaming sentiment in favor of war is now being tried, with much preliminary success, in the case of Japan and the United States. Either country has its unscrupulous newspapers; but ours exceed the Japanese in number and in the devilish ingenuity with which the facilities for collecting and disseminating information are utilized to make the thoughts of readers bloody. We saw the whole process illustrated in 1895-98. Yellow journalism scored its greatest triumph, or touched its deepest shame, in bringing on the war with Spain. The methods were then made familiar. They are now being imitated, almost to a hair. If Franklin were alive, he would deduce from them rules for making a peace-loving nation turn into a quarrelsome braggart and bully.

Your truly warlike editor, living at ease, but writing as if he ate gunpowder, always begins by protesting that he ardently desires peace. He merely scatters his firebrands as "precautionary measures" setting the house on fire to test the efficiency of the engine company. Urging the doing of things which breathe of war and look to war, he asseverates his conviction that they will be the surest guarantee of peace. So it was before the war with Spain. This, that, or the other hostile move was declared by the newspapers in charge of the campaign to be the one thing that would certainly avert war. So now, the dispatch of our battleships to the Pacific is represented as the infallible means of keeping the peace. Yet the naval demonstration is, at the same time, seized upon as an excuse for printing columns and pages of matter which can have but one aim and one effect—to provoke the war spirit. Naval experts are called upon to state whether the fleet is "ready," and whether we could surely whip Japan. Then there is gathered reams of stuff going to show that "Editors Endorse Plan to Send Fleet of Big Battleships to the Pacific." This is got by scraping the press of the country, and erecting the Butte *Inter-Mountain* and the Fort Wayne *Sentinel* into important organs of national opinion. Next comes the assembling of "Public Sentiment" as expressed by "Representative Citizens." In special dispatches we are informed what Michael Ryan of Cincinnati considers to be correct naval strategy, and what Moses H. Brand of Milwaukee thinks the true policy to pursue. All this is churned over, or whipped into froth, day after day, with a result which is often comic, frequently ridiculous, but which remains in the end both disgusting and perilous.

Most people, we know, simply laugh at all this newspaper dabbling in war. But is it not dangerously like "the laughter of fools"? The fool, wrote Burne-Jones in one of his letters, has three laughs. "He laughs at what is good, he laughs at what is bad, and he laughs at what he does not understand." It is this latter, empty amusement over the attempt of certain editors to "get up a war score," which is really disquieting. It ought to be better understood what this sort of thing leads to. It poisons the general mind by making its presuppositions warlike instead of peaceful. Men and nations are what they are largely on account of their mental presumptions, the atmosphere which they unconsciously carry about with them. This, in an industrial democracy like ours, is normally one of peace. Business cannot go on, nor commerce extend, if men's minds are fixed upon battles and sieges and sudden death. Hence the need of cultivating the temperament of peace—of teaching citizens to look for stability of conditions and for orderly progress, instead of being on the watch, all the while, for the shocks of war. Hence, also, the villany of those lily-fingered and luxury-loving editors who, either to glut a private revenge, or to promote private financial speculations, or perhaps, merely to make a newspaper sensation in a dull season, try to upset the equilibrium of the country, and force thoughts of war into minds where, but for this wicked newspaper clamor, they would never find entrance. Such a phenomenon it will never do to treat, with our easy American good-nature, as merely a hot-weather joke—to pass it off with our perpetual giggle. Terrible consequences may spring from this criminal trifling.

One of the most unpleasant features of the whole affair is the strange course of the Administration. If our President were, on his own confession, anything but the sincerest and squarest of men, we should be troubled by the apparent duplicity of the statements made in his name. On Tuesday last his private secretary gave an official *démenti* to the rumors that a squadron of battleships was to be sent to the Pacific. "You may say that the President has not even considered the advisability of sending *any* ships to the Pacific." Two days later, this became a "possible" cruise to the Pacific, but not "at once." After that, came Secretary Metcalf's announcement in California that the battleships were to go directly to the Pacific, and that the plans for the movement had been made long before in Washington. All this may be firm and wise and consistent statesmanship, but any one can see how deplorably it lends itself to the brawling of the sensational newspapers. Considering the very bad impression made both at home and abroad, we think that the Commander-in-Chief of the Navy ought to revoke his order—or, if necessary, give out a new version of what he had always intended to do. If it is needful, for practice, or in order to show the world how quickly we can mobilize a fleet, that battleships be swiftly sent somewhere, let their destination be made the Mediterranean or the North Atlantic. Should the President, after all this vacillation and conflicting announcement, persist in sending the squadron of fighting ships to the Pacific, it can only be taken as a willingness, on his part, to heighten the bad feeling against the Japanese (with whom he was so dead in love only last December) and to encourage the talk of war.

TARIFF COUNSEL FROM THE COUNTING-ROOM.

Though it falls in the summer season, when the political thermometer is at its very lowest, the taking effect of the new German tariff agreement is made the occasion for a demonstration of distress by the standpatters. One could obtain, even before it took effect, a carefully compiled and comprehensive account of the havoc which the agreement is to inflict on American industry. Any one who accepts the premises that the interest of any single branch of manufactures is superior to that of the whole country, and that the buying of foreign products is an evil *per se*, can work himself to a high pitch of alarm over even the smallest grudging concession. That Germany has received something in exchange for a second postponement of her advanced tariff on our products is, of course, the height of injustice to the high-tariff mind.

Under our system, opinions of mere "consumers" are not likely to avail against the Dingley tariff until they are supplemented by the demands of special industries, interests pulling against interests. How far this force is already in operation is well shown by the opinions from business men assembled in the *Annals of the American Academy*, under the title of "Tariffs, Reciprocity, and Foreign Trade." Here is no counsel from the closet. Charles Deering writes on the tariff and the price of agricultural machines; Louis Müller of Baltimore on its relation to the grain trade; J. Ogden Armour on the tariff and our foreign trade in meats; Maurice Coster, export manager of the Westinghouse Company, on its relation to our foreign trade in electrical apparatus; A. Augustus Healy on the leather industry, and W. B. Mershon of Saginaw, Mich., on the lumber trade.

These great national industries are unconnected; one might prosper while the others declined, or successfully invade a foreign market from which the others were repulsed. Yet the picture here drawn of industrial conditions today is surprisingly alike in its several parts. Each export industry, these ex-

perts declare, maintains itself precariously, and is everywhere menaced, unless our Government is willing to join with those of Europe to secure freer trade, or to give relief by admitting raw materials. The tariff which Germany holds in readiness when our present agreement expires is so high that, as Mr. Deering says, "If such an increase does not destroy our German trade in agricultural implements, it will be sufficient at least to cripple seriously its development." Under that of Austria-Hungary, "it is only a question of time when more-favored manufacturers will drive American products out of the market." As for grain, Mr. Müller declares that "there is absolutely no hope of competing with any country that enjoys the minimum rates, if the United States has to pay the maximum rates, because it is hardly conceivable that the wants of Germany cannot be entirely filled by any country enjoying the minimum rates." "Given a fair opportunity," says Mr. Armour, "there is no reason why we should not be able to sell Germany a large proportion of the cattle she imports annually. But, better still, from an economic American standpoint, we should, with a fair adjustment of our tariff relations, be able to sell her immense quantities of pickled and canned meats. Her people would be glad to get them—if given a chance."

"The time has come," in Mr. Coster's view, "when it is difficult to compete with the French, Germans, and Austrians for electrical apparatus to be used in their own countries." The lower labor-cost in these countries, he thinks, would not overbalance the advantage of our workmen's superior skill, but for "the discrimination of the foreign tariff, which . . . has been so adjusted as to gradually encroach on our trade in many countries, in some instances practically bringing our exclusion." The leather industry, asserts Mr. Healy, "has never demanded that the people of the United States be taxed for its benefit, but itself has been, and is now, taxed for the benefit of other and more favored industries." Mr. Mershon finally declares that, "as a manufacturer, as an employer of labor, and as one who has been in the lumber business all his life and is now engaged in it, as an owner of forests and timber lands and saw mills, I cannot see wherein the Government is not making a great mistake in maintaining this tariff upon rough lumber, taxing our home industries for their raw material, and offering a premium for the destruction of our present forest area."

We have thought it worth while thus to outline the arguments of spokesmen for these leading industries, because this is the sort of appeal which by sheer iteration may in time induce Congress to end its present policy of inaction. In the exciting days when the Dingley law was being framed no industry which made anything like so strong a case for relief as any of these would have been sent away without a special clause drafted for its benefit. But the cry, "Give us a tariff or we perish," is much more appealing to Congress than "Take away the tariff or we perish." Our fiscal system works on a sort of ratchet which enables duties to be raised at the simple turning of a crank, but demands a tremendous amount of effort to let down even a single cog.

According to the protective theory, each person or industry which the tariff law fails to protect is one more argument for at least bringing the law up to date. The grain trade is our largest branch of agricultural industry. Among our manufactures, slaughtering and meat-packing ranks first in net value of product, lumber and timber products fifth, leather eleventh, agricultural implements thirty-sixth, and electrical apparatus and supplies forty-first, out of 354 classified industries. What is to be the answer when these insist that, instead of paternal care, our Government has given them only hampering restrictions?

THE PROPHET AND THE LEADER.

If there were any doubts that Marcelin Albert, so recently acclaimed the redeemer of the French Southland, was really entitled to consider himself entrusted with something of a spiritual mission, his present fate should remove them. It is not merely that Albert is now in prison charged with fomenting public disorder. His brevet as prophet comes primarily from the fact that he has been repudiated by his erstwhile followers and denounced by his own lieutenants as a traitor to the cause he set on foot. Yet his only transgression has been that at a moment of crisis he attempted to call a halt on a movement that had already outrun his personal control. "The best informed among my authorities call him a simpleton," writes the Vicomte de Voguë from Montpellier. Others more cruel call him a madman. Simple or mad Marcelin Albert must have been, to imagine that a popular uprising can be gauged up to a previously designated mark, and brought suddenly to a stop. Dr. Ferroul, his practical-minded aide-de-camp, knows men better, of course, and from his cell urges the Southerners to go on demanding concessions they had no thought of at the beginning. When Albert and Ferroul regain their freedom, obscurity most probably will fall to the former, while there is no telling what bounteous aspects may beam on the other's eyes.

Numerous critics, writing on the present situation in Russia, have fallen into the habit of ascribing what they consider the failure of the revolutionary movement to the absence of competent leadership. Putting aside the objection that this is merely indulging in a species of wisdom after the fact, which would discern splendid capacities for leadership among the Slavs if they had succeeded instead of failing, we may point out a certain important difference between the leader and the prophet. The one manipulates forces that he finds ready to his hand; the other's task is to bring non-existing forces into being. Now, Russia is as yet unprepared for the leader's work, and is still the proper field only for the prophet. Many millions of peasants must be aroused, millions of workmen must be educated more thoroughly than they have been; a clearer consciousness of aim must be created among the chaos of nationalities, classes, and creeds before there can be any opportunity for real statesmanship. There must still be long years of secret propaganda, of conspiracy, of education by pamphlet and word of mouth and, possibly, the bomb, before the revolutionary movement is actually in full swing. And many small and obscure prophets will labor and perish or be swept away by the result of their own efforts after the destiny of their tribe.

Before we can look to the appearance of a great leader in Russia, we must be prepared for the appearance and disappearance of many more great personalities than we have had as yet. It is almost essential to the rise of a successful leader that he should have been preceded by many failures, or, as we have just called them, prophets in their own line. Absolutism, constitutional monarchy, moderate republicanism, Jacobinism, terrorism, had all to be tried and found wanting before a Napoleon appeared. And so in the Russia of to-day and to-morrow, there must still be Plehves, Wittes, Stolypins, Milyukoffs, and Gapons before the successful leader learns to hammer his success out of the rough ore of their labors and their failures.

Such a leader will escape disaster because he will have learned the lesson that the prophet never learns—of riding with the tide and never boldly attempting to halt it. In that he shows a deeper knowledge of the nature of popular movements than the seer, poor simple soul that he is. The latter imagines that if you want a crowd to get to X, you set the crowd into motion, and when you get to X you stop. The practical man knows that, once set into motion, the crowd may find the sensation of travel so pleasant that, aided by the law of inertia, it will insist on pressing on beyond X to Y and Z. What victorious nation ever contented itself with exacting as the reward of victory no more than what it set out to fight for? What triumphant political party ever held itself restricted by its pledges? What tre-

mendously popular statesman has ever held himself bound by his previous record? It is only the unpractical man, the idealist, the prophet, that will cling to a fixed conception of truth and aim. The practical man knows that the goal always recedes before a crowd as it advances, and so he keeps on moving in step with it—and always a little in advance.

That Russia is still unprepared for leadership, in this sense, is apparent from the fate that has overtaken the various political figures we have mentioned, beginning with Gapon, who affords us a tragic parallel to Marcelin Albert. Gapon imagined that he could carry on a democratic labor movement by peaceful means without actually antagonizing the Russian autocracy. Had he been wiser, the massacre of Red Sunday should have undeceived him. He had aimed at a labor movement, and set on foot a revolution, and when he attempted to stem the tide by entering into relations with the Government, he sealed his own fate. Witte took the reform movement in hand and guided it to the stage of constitutional monarchism, but he was in turn swept off his feet by the mad rush towards social revolution. Stolypin imparted to the movement a sharp swerve backwards, but only to be carried much further than he wished towards reactionism. Not until the various conflicting forces in Russia have been brought to act steadily and consciously in their respective direction will the opportunity be at hand for the successful leader.

CHILD SUICIDE.

The causes and the prevention of suicide among the young is the subject of a book just published by Louis Proal of the Paris Bar. Some years ago M. Beule wrote in the *Revue des Deux Mondes:* Suicide, which in particular cases we condemn, pleases us in tragedy and history, precisely because it no longer has a place among our customs." The author of those very words took his own life; and M. Proal shows not only that the crime has become more common in Europe, but that a considerable percentage of those who commit it are children. His work is not a morbid study of an unpleasant subject: it is rather a serious consideration of an evil which, according to statistics, constitutes a menace to French society, with suggestions concerning its prevention and cure. In 1839, out of a total of 2,752 suicides in France, 20 were those of boys and girls under the age of sixteen. From that time until 1869 the number of youthful suicides reported annually remained almost stationary. Since then, however, there has been an increase in the number of adults as well as of children who take their own lives. In 1879, for example, out of 5,114 suicides, 37 were less than sixteen years of age; and in 1902 there were 59 cases of children among 8,716.

These figures, however, do not give all the deaths from this cause; for where children have killed themselves parents and teachers are reluctant to make it known. Moreover, in many cases where children have attempted suicide, no report has been made to the police. France is not alone in noting this increase; for something like it has been observed in parts of Germany, Switzerland, and Spain. Happily, the census shows the evil to be but little prevalent in the United States. But its growth in Europe has been so marked as to present a problem for the psychologist and criminologist. M. Proal observes that nearly all the faults of adults are to be met with also in children. Rousseau, who insisted that children were depraved because of education, had little experience of their ways, for his own offspring were made a public charge. Education has to develop what is good, but it also has to remedy what is evil in the character of the child.

Suicides are more frequent among city than among country children. The latter are less confined, and less overworked at school; nor are they made so familiar with vice and acts of violence as those brought up in the crowded precincts of the larger towns. In general, the causes of suicide are emotional; and among these jealousy has an important place with the child. And this illustrates the evil of favoritism on the part of parents and guardians. Says M. Proal:

> In the sentiment of jealousy there is not only the egoistic desire to possess all the affection of parents, the refusal to share their caresses with the sisters and brothers; there is also an ardent demand for equality. The child wishes to be loved as his brothers and sisters are, because he has the same right to parental affection as they have. . . . All injustice, particularly that which proceeds from parents, puts him into rebellion, exasperates and discourages him.

Other moral causes act in the same disastrous way, such as sudden anger, pride, a luxurious or effeminate education, differences and disputes between parents, excessive intellectual effort, family privations and bereavements. Suicide may be induced by physical causes also, such as ill health or bodily deformity.

In his chapters dealing with the prevention of suicide M. Proal has much to say in criticising the severe treatment of children at home and at school. Continual scolding, reproof about trifling matters, punishment upon slight provocation, he disapproves. Children should never be kept at school during vacations, which may give rise to melancholia or depression of spirits. Of course, the severe pressure of rigorous examinations is to be condemned, and M. Proal says that in China, for example, during the tests for the civil list, the number of suicides increases appreciably. In many instances children are predisposed to take their own lives by neurasthenia, hysteria, or epilepsy. These, however, are only predispositions; they are "occasional," not "efficient," causes, and may be counteracted by general hygiene or medical treatment. A defect of the will often indicates a defect of health. Disgust with life is almost always the effect of a sickly temperament. Attention to diet and sleep, fortifying the nervous system in various ways, may free the child from this dangerous tendency. It is, moreover, important that the young should be supplied with optimistic literature, and that they should, if possible, be led to believe in immortality, which may give them pause when they reflect upon self-inflicted death. While all the great pessimists have taught what should lead logically to suicide, they themselves, in most instances have felt the joy of living. It is their disciples who desire death.

M. Proal differs from Dr. Magnan in holding that suicide with the child is always impulsive, never deliberate; and in this he seems justified both physiologically and clinically. Any feeling which can overcome the instinct of self-preservation must be very intense; and when the unformed mind is swayed by grief, pride, or pain, there is lacking that experience and mature deliberation which in the adult might inhibit suicidal action. Hence, since suicide is possible at all, it is not strange that the child should commit it, but it is strange that he should commit it so rarely. While a tendency to take one's own life may not imply insanity or degeneration, it shows that the mind has lost its equilibrium, and that the proper remedy is to be found in wholesome training. In these days, when the gospel of envy and discontent is preached in so many quarters, M. Proal insists that the virtues of resignation and endurance should be forced by precept and example. "Le révolté devient facilement un désespéré." And if society takes so much pains to protect the young against external evils, it should do all in its power to protect them against themselves.

THE PERILS OF PHOTOGRAPHY.

A few days ago amateur photography had a martyr in the young man who was seized by a cramp and drowned while swimming in some rapids under the eye of the camera. In this case it was the subject who underwent the danger; usually it is the photographer. In its infancy amateur photography was regarded as rather a mild pastime, not

exactly effeminate, but dilettante. The photographer puttering about his dark-room or holding the little cap while he counted seconds was anything but an exemplar of the robust virtues. This is changed. The progress of invention which has made Arctic exploration relatively easy has added immensely to the dangers to be faced by the photographer.

In a recent book on the routine of journalism there is a somewhat pathetic account of the difficulties of the photographer, whether employed by a newspaper or not, who essays to record the news, so to speak, on his dry-plates. The reporter, in all conscience, has a hard enough time on occasions, but at least he need not blazon to the world that he is a reporter. The "special artist on the spot" in the civil-war period could make sketches on his cuff. But the photographer may not put trust in disguises or excuses. His apparatus cannot be mistaken for anything else under heaven. Everybody knows he is taking pictures, and if any one resents it, the camera is one of the most vulnerable points of attack. One ray of sunshine, and the work is spoiled. The rôle of a busybody is bad enough, but to be a busybody with fifty pounds of cumbersome apparatus along so that one cannot even run away, is far worse.

Of course, the adventurous photographer has some peculiar triumphs. "You will notice, ladies and gentlemen," says the announcer in the vaudeville theatre, "that the moving picture is interrupted just after the fire reached the second story of the dynamite factory. The reason is that at this point the building exploded, burying the photographer under ten feet of masonry. Fortunately, however, his film-holders were uninjured." The audience can only get a faint reflex of the pride that must have filled the daring youth as, beneath the burning deck, he shielded his biograph apparatus.

But it is not only in the haunts of men that the photographer is called on to do and dare. It is the humane custom of our day to go to the woods unarmed; but the wild fauna do not subscribe to our disarmament proposals. Not only has the outdoor photographer of wild life, like Emerson,

> named all the birds without a gun,

but, like Spartacus, he has learned to gaze into the glaring eyeballs of the fierce Numidian lion, even as a boy upon a laughing girl—and press the button as the lion springs.

William T. Hornaday of the Zoölogical Park, though himself an adventurous naturalist, reproves in one of his books the foolhardiness of a colleague who secured some marvellous pictures of Rocky Mountain goats and sheep by pursuing them to crags or promontories reached by no other paths than those up which they had come, and then, while the creatures were making up their minds whether or not to butt the photographer down the precipice and to eternity, taking their likenesses and retreating. Really, the custom which has become common of having a second photographer at hand to photograph the feats of the first photographer commends itself. Here is a photographer coming down in a parachute in order to record in passing the secret evolutions of a new airship. Perhaps he will succeed, perhaps not; but, at any rate, the snapshot of his headlong descent made by his friend on the ground will be vastly acceptable to the widow and the orphan.

It must always be true that chance has a large part in producing the sensational successes of popular photography. We know of a case in which an amateur had "snapped" a fleet of fishing schooners, or some such craft, and on developing the plate discovered that at the very instant of his exposure a man had fallen from the masthead of one of the vessels and was represented in mid-air. Similarly, an English magazine published, a year or two ago, what was declared to be an authentic photograph of a man having his leg bitten off by a shark. He had fallen overboard in the tropics and the shark seized him just as a fiend on deck had jokingly photographed his predicament. These were pictures which, short of methods like those of the Greek sculptor who flayed his slaves in order to study their agonies, all the forethought and care in the world would not have secured.

On the other hand, the deliberate taking of chances does not necessarily bring good results. Every one has seen photographs of battle, murder, and sudden death which are mere hodge-podge, unintelligible unless marked with Maltese crosses at the important spots, and full of suggestion only because one has already been told that they were taken under perilous or harrowing conditions. Events perversely refuse to adapt themselves to the photographer's art. The actors in historic scenes do no credit to the stage manager. Squadrons, in their excitement, lose their alignment just as they pass the reviewing stand. Harassed committees and marshals give away so many tickets that great ceremonials are crowded and screened. Hence it is that all the photographer's activity and pretensions need not make the historical painter fear for his livelihood. His barons never get in the way of a clear view of King John at Runnymede; nor has he to erase any of the Roman populace with gray pigment in order to reveal whether it is a crown or a dish of lampreys which Mark Antony is offering to Cæsar.

BIBLIOGRAPHICAL NOTES ON DEFOE.

II.

Although Defoe's name had figured in Cibber's "Lives" and in booksellers' catalogues, and although collectors like Bishop Percy and Isaac Reed had taken an interest in him, it was not until 1790, so far as I can discover, that the first fairly important list of his writings was printed. This was appended by George Chalmers to the revised "Life," which he prefixed to Stockdale's attractive edition of "Robinson Crusoe." The results of Chalmers's labors seem very meagre to-day, but no one can examine his memoranda and his correspondence as I have done, thanks to Mr. Aitken, without feeling that he deserves to be praised as a faithful pioneer in a difficult and ungrateful task. His list of ninety-nine genuine and dubious items was not superseded until 1830, when Walter Wilson, the friend of Charles Lamb, published his "Memoirs of the Life and Times of Daniel Defoe," to the first volume of which was prefixed a list of writings containing two hundred and ten items. Wilson had profited much from Stace's catalogue of the extensive collection of Defoe's works offered for sale in 1829, and there is abundant evidence that he included items which he had either never seen or only slightly examined; nevertheless, both as a bibliographer and as a biographer, he made a great advance upon Chalmers. Ten years later William Hazlitt the younger issued, in the first volume of his frustrated edition of Defoe's works, a list of genuine and doubtful writings, which was marked by more acumen than Wilson had shown, and was more important than the revision of Chalmers's list, published the next year in volume xx. of the well-known "Oxford Edition." Then in 1858, in the third part of Bohn's revision of Lowndes's "Bibliographer's Manual," Defoe was credited with a large number of genuine and spurious works, the latter being extraordinarily numerous; and eleven years later Lee's "Catalogue" superseded all previous attempts to explore what it is scarcely an exaggeration to term this bibliographical chaos.

In his introduction, Lee gave some statistics with regard to his labors. He rejected "more than sixty" items from Bohn's Lowndes, thirty (including duplicate entries) from Wilson, and twelve from Hazlitt, retaining, however, seven titles which the last-named had not accepted as genuine. He added sixty-four new titles, several of them being those of journals with which Defoe was connected. How far Lee used the collections of Defoe's works to be found outside of London and Oxford is not clear, but his letters to Crossley (owned by Mr. Aitken) and the catalogue of his library show that he had examined a considerable proportion of the tracts and volumes which have been attributed to Defoe by collectors and dealers within the past century and a quarter. Doubtless many of the omissions I propose to enumerate were due to the fact that Lee had never seen or else never carefully examined the pamphlets in question; but not a few were due in all probability to his unwillingness to accept any work the authorship of which would set Defoe in a bad light. I have had access to collections and to bibliographical information, printed and written, which Lee

could not have utilized, and there has been much new light thrown upon Defoe's character by his correspondence. Hence it is not surprising that I feel justified in saying that Lee's bibliographical work is far more in need of being supplemented than it is of being corrected. It is surprising, however, in view of the pleasant relations apparently existing between Lee and Crossley, that the latter, some time before his death in 1883, should have been able to draw up a list of sixty-one items which, in his opinion, had been unwarrantably omitted from Lee's "Catalogue." In *Notes and Queries*, shortly after the publication of Lee's list, Crossley stated that more than fifty genuine works remained to be added, but he did not enumerate them. These omissions cited by Crossley will be treated together after I have noted what seem to be errors in Lee's rejections from the ascriptions made by previous bibliographers.

Of the items rejected by Lee from Wilson's list—thirty by his count, but thirty-two by mine—three were without titles, having been inserted by Wilson on the basis of vague statements by Defoe. Of the remaining twenty-nine, I have been unable to see six in any form, and of a seventh I have found only a fragment. Of the twenty-two left I am quite definitely prepared to argue for the acceptance of two. One is "What if the Swedes should come," etc. (1717), about which Wilson was very doubtful, but which Crossley and the catalogues of the Advocates' Library and of Yale assign to Defoe. In my judgment the internal evidence for the ascription is completely convincing. Internal evidence is equally strong for "The Christianity of the High Church Considered" (1704), which Lee categorically assigns to White Kennet. The British Museum Catalogue gives the tract to Defoe, I can find no authority for the ascription to Kennet, and I think that the way Defoe's opponent Leslie refers to it, and other circumstances, support the strong internal evidences of its genuineness. I suspect that Lee's rejection was largely determined by his desire to save Defoe's consistency, the tract having been dedicated to Lord Haversham, with whom our pamphleteer shortly afterwards had a quarrel; but I should like more information with regard to the specific ascription to Kennet. A third item assigned by Wilson and others to Defoe, but discarded by Lee, "A Letter from a Member of the House of Commons to His Friend in the Country, relating to the Bill of Commerce, etc." (1713), has not a few of Defoe's characteristics, and is most probably from his pen, but I do not at present think the evidence strong or abundant enough to warrant a very positive ascription.

The relations of Lee's list with that of Hazlitt need occupy us only a moment. By my count Lee rejected fourteen instead of twelve of Hazlitt's items, and retained eight instead of seven of the tracts which the latter regarded as spurious. At present I am inclined to think that so far as concerns these twenty-two tracts Lee erred only in rejecting "The Christianity of the High Church Considered," which Hazlitt had accepted, and in accepting "A True State of the Difference Between Sir George Rooke, Kt., and William Colepeper, Esq.," which Hazlitt had rejected.

The "more than sixty" items which Lee said he omitted from Bohn's Lowndes amount to precisely seventy, if I count correctly, but I admit that the chances of making errors in dealing with such a hodgepodge of entries are far from small. Possibly Lee did not count items Bohn showed to be by other authors.

Ten of the seventy I have not seen, or else at this juncture cannot pass upon competently. Of the remaining sixty rejections, I find occasion to question only four, three of which have been already mentioned here. The fourth is "Some Further Observations on the Treaty of Navigation and Commerce" (1713), which Hazlitt printed in his edition (vol. iii.), although he had not included it in his list of Defoe's writings. On the whole, I am inclined to feel, that although this little pamphlet takes a view of the French and English trade inconsistent with Defoe's more or less official utterances, and that hence Hazlitt, who believed in Defoe's consistency, should not have accepted it, nevertheless it is probably, though far from certainly, from our pamphleteer's pen.

We may now turn from Lee's relations with his chief bibliographical predecessors to consider (a) the discrepancies between his list and that furnished by the Catalogue of the British Museum, and (b) the additions suggested by Mr. Crossley. The small discrepancies revealed by a comparison of his list with the entries in the catalogues of the other libraries I have examined will be best considered in connection with my own list of suggested omissions, which will close this series of communications.

It would not, of course, be fair to hold Lee responsible for all the differences between his Catalogue of 1869 and the columns upon columns of printed and written items which last summer gave me a clue to the books and pamphlets of Defoe to be found in the great library of the Museum. It is convenient, however, to note here that there seem to be about thirty-seven positive and doubtful ascriptions to Defoe in the immense catalogue that are not to be found in Lee's list. Perhaps two or three of these, entered by hand, are intended only as tracts that deal with Defoe, a point on which my notes do not enlighten me. Of this large list some are plain errors, *e. g.*, the queried ascription to Defoe of Gay's poem "Wine," and the categorical ascription of Josiah Woodward's "Account of the Societies for the Reformation of Manners"; others are rejected by nearly every competent student of Defoe, others are doubtful, and a few certainly genuine. The genuine items, besides a tract on the South Sea scheme to be mentioned later, are in my judgment:

(1.) "Moderation Maintain'd" (1704), a pamphlet in praise of a sermon by Kennet—shown to be Defoe's not only by its substance and style, but by the initials D. F., which no one else at that juncture, not long after the pillorying, would have been likely to append to the preface of such a performance.

(2.) "The Ballance: or, a New Test of the High-Fliers of all Sides, etc." (1705), attributed by an old hand to Defoe, and almost certainly his, since it contains characteristic references to other works of his, as well as an autobiographical statement that fits a passage in his life.

(3.) "The Trade of Britain stated, etc." (1707, misdated 1708), a short tract, which I found to be merely a reprint of two numbers of the *Review*.

Whether another short pamphlet, "Observations on the Fifth Article of the Treaty of Union" (1706), which is also ascribed to Defoe in the Catalogues of the Rylands Library and the Advocates' Library, is correctly attributed, is a question hard to answer. I suspect that it is; but a tract full of figures and details, and so brief that a writer's peculiarities have little chance to emerge, is one about which any bibliographer is liable to err, unless he has strong external evidence. There are fully half a dozen such trifles entered as Defoe's in various catalogues, over the genuineness or the spuriousness of which it seems almost idle to argue; and while it will be desirable to enter them later in a full bibliography, I shall say nothing about them here.

The sixty-one tracts assigned to Defoe by Crossley over and above the ascriptions made by Lee are enumerated in a manuscript list now owned by George A. Aitken. This number is much smaller than that of the items advertised as Defoe's on the authority of Crossley in a catalogue of second-hand books issued by Pearson & Co., in 1885. This catalogue contained, however, so many plain errors—for example, it quoted a note from Crossley which, if the date given were exact, must have been written a little while after his death—that I was forced to regard the manuscript list, despite the fact that that was not dated, as representing the great collector's final contribution to the bibliography of the man to whom he devoted so much time and thought.* On examining the British Museum's priced catalogue of the sale of Crossley's library (June, 1885) I was convinced that in the main the items in the Pearson Catalogue came from twenty-two bound volumes of tracts bought by the firm, and that those volumes contained many pieces the genuineness of which Crossley would never have claimed. Still, the Pearson Catalogue is valuable to any student of Defoe, and I owe to it the first suggestion of one or two pamphlets which I think should be ascribed to him.

One of Crossley's items, "Due Preparations for the Plague" (1722), was, as I have already stated, accepted by Lee also, and is unmistakably Defoe's. Another, "What if the Swedes should come?" has been mentioned as one of Lee's unjustifiable omissions from Wilson's list. Of the remaining fifty-nine items I have examined fifty-two certainly and possibly fifty-three—if, as I think, one entry duplicates another. The six or seven items I have not seen will be enumerated later in a list of desiderata; I will now briefly report on the tracts examined.

Two seem to have been definitely claimed by bibliographers for other authors, to wit: "An Account of the Obligations the States of Holland have to Great Britain, etc." (1711), and "The Causes of the Discontents in Relation to the Plague, etc." (1721), the first of which is generally assign-

* Another example of a flagrant error may be given: "A Faithful Register of the late Rebellion" (1718) is assigned in the catalogue to Defoe, but I find written in the Columbia University copy "An interesting account, though not, I think, Defoe's," with the signature "James Crossley." It is not likely that this was Crossley's copy, but *Notes and Queries* makes it certain that the entry represents his opinion.

ed to Robert Ferguson, the second to Bishop Edmund Gibson. Careful analysis does not impel me to champion Crossley's ascriptions to Defoe; but it should be said in justice to Crossley that, on the surface, both tracts seem in style and substance the product of the most prolific pen of that generation. That even Crossley should have been deceived should be a warning to others; but the fact that the style of the two tracts does not answer all the tests for Defoe is on the contrary encouraging to the bibliographer who relies upon such tests.

Taking the remaining tracts in chronological order we have

(1.) "Reflections on the Prohibition Act, etc." (1708), which is a very plausible ascription.

(2.) "The Re-Representation; or, a Modest Search after the Great Plunderers of the Nation, etc." (1711), most probably Defoe's.

(3.) "An Essay upon the Trade to Africa, etc." (1711), very probably Defoe's, and upon a subject that frequently occupied his pen.

(4.) "The True State of the Case between the Government and the Creditors of the Navy, etc., As it relates to the South Sea Trade, etc." (1711), most probably Defoe's, and not impossibly duplicated in another entry in Crossley's list, which reads "The True State of the Case as relates to the South Sea Trade" (1711), a tract I have failed to find, though I have searched some very large collections.

(5.) "A Farther Search into the Conduct of the Allies and the late Ministry, etc." (1712—attributed to Swift by Roscoe), very probably Defoe's.

(6.) "A Defence of the Allies and the late Ministry, etc." (1712), almost certainly Defoe's.

(7.) "The History of the Jacobite Clubs, etc." (1712), a by no means unlikely but, for certain reasons, a doubtful ascription.

(8.) "Peace or Poverty, etc." (1712), a most probable ascription, also to be found in the Yale Catalogue.

(9.) "Proposals for Employing the Poor, etc." (1713), plainly Defoe's.

(10.) "A Brief Account of the Present State of the African Trade" (1713), most probably Defoe's, and attributed to him with a query in the Yale Catalogue.

(11.) "A Letter to the Guardian about Dunkirk" (1713), a not unlikely attribution, but too brief a tract for positive ascription.

(12.) "Nott [ingh] am Politics Examined, etc." (1713), not improbably Defoe's.

(13.) "A Letter to Mr. Steele, Occasion'd by his Letter to a Member of Parliament, concerning the Bill for preventing the Growth of Schism" (1714) is not positively identified as Defoe's by Mr. Aitken, who lent me his copy, but I thoroughly agree with Crossley's ascription.

(14.) "A Letter to the Whigs, Expostulating with them upon Their Present Conduct, etc." (1714) is certainly Defoe's, and is stated to be by him in a contemporary hand on Crossley's copy and also on the Yale copy; why Lee rejected it is incomprehensible to me.

(15.) "A Brief Survey of the Legal Liberties of the Dissenters, etc." (1714) is plainly Defoe's, and he probably edited "A Collection of all the Papers that have been Given to the Lords and Commons, In Relation to the Bill to Prevent Schism" (1714), which quotes from it.

(16.) "The Case of the Catalans Consider'd" (1714) is so good a tract that I rather hope Defoe wrote it, but the internal evidence does not seem strong enough for a very positive ascription.

(17.) "The Second-Sighted Highlander, etc." (1715), an attribution supported by Col. Grant and by the Yale Catalogue, is specially interesting to me, not only because I made it independently, but because if it is accepted, we must ascribe to Defoe a series of skits, suggested by Swift's joke on Partridge. This series began in 1711 with "The British Visions: or Isaac Bickerstaff's Twelve Prophecies for the Year 1711," and was continued to include this tract of 1715. My own ascription of the series was due to the prominence Defoe gave it in the *Review*, and I found afterwards that this had caused Mr. Aitken also to suspect that he had a hand in it. I have examined only the tracts for 1711, 1712, and 1715, and they all certainly bear out Crossley's attribution of the single one he seems to have known.

(18.) "Burnet and Bradbury, or the Confederacy of the Press and the Pulpit, etc." (1715) is also tentatively ascribed to Defoe in the Yale Catalogue, and I think is unquestionably by him, although Crossley states that in his copy there was a note attributing it and "A Friendly Epistle to . . . Thos. Bradbury" (No. 165 of Lee's list) to H. Watkins, student of Christ Church. The pamphlet purports to be by a novice, but there are few items in Defoe's bibliography of the genuineness of which one can afford to be more certain.

(19.) "Some Methods to Supply the Defects of the late Peace, &c." (1715) is one of the tracts attributed to Defoe by Boyer, and is also given to him in the Yale Catalogue. In my judgment, it is plainly his. It answers exceptionally well the stylistic tests, and has been steadily attributed to Defoe ever since it was written.

(20.) "Memoirs of Some Transactions during the late Ministry of Robert E. of Oxford" (1717) is the same as "An Account of the Conduct of Robert Earl of Oxford" (1715), which Boyer assigned to Defoe, and it seems surely his. It is among the attributions by Col. Grant.

(21.) "Some Considerations on the Danger of the Church from her own Clergy" (1715) is very plainly Defoe's, and a tract in which he hits at the frustrated treaty of commerce with France, an attitude which, it will be remembered, was one of Crossley's chief reasons for rejecting the tract on the Triennal Bill claimed by Defoe!

(22.) "An Humble Address to our Sovereign Lord the People" (1715) is much in Defoe's manner, but, as the point of view is more or less that of a High Churchman, ascription should be somewhat tentative.

(23.) "The Fears of the Pretender Turn'd into the Fears of Debaucbery, etc." (1715) is plainly Defoe's.

(24.) "Strike While the Iron's Hot, etc." (1715) seems certainly Defoe's.

(25.) "Memoirs of the Conduct of her late Majesty, etc." (1715) is clearly Defoe's—cf. my remarks on "The Secret History of the White Staff."

(26.) "The Secret History of State Intrigues, etc." (1715) is the same as "The Secret History of the Scepter, etc.," and can scarcely be by any other author than Defoe.

(27.) "The Conduct of Some People about Pleading Guilty, etc." (1716) seems certainly Defoe's.

(28.) "A True Account of the Proceedings at Perth . . . Written by a Rebel" (1716) has been attributed to the Master of Sinclair, but has been shown by Lord Mahon not to be his—cf. "History of England from the Peace of Utrecht, etc.," Appletion, 1849, I. 135 *note*. Crossley's ascription to Defoe seems to me much more than plausible, perhaps entirely convincing, and, if we give the tract to him, it strengthens the presumption that he wrote the histories of Charles XII. and Peter the Great.

(29.) "The Danger and Consequences of Disobliging the Clergy Consider'd, etc." (1716-17) is most probably Defoe's.

(30.) "The Danger of Court Differences etc." (1717) is plainly Defoe's.

(31.) "A Letter to Andrew Snape," etc. (1717)—as this contribution to the Bangorian Controversy purports to be by the author of the "Declaration of Truth", to Hoadly, which is No. 182 of Lee's list, it must have been omitted by the latter only because he did not know of it.

(32.) "Secret Memoirs of a Treasonable Conference at S . . . House, etc." (1717) is most probably Defoe's and is one of the tracts attributed to him by Boyer, whose sagacity in such matters I have come to admire.

(33.) "The Question Fairly Stated Whether Now is not the Time to do Justice to the Friends of the Government, etc." (1717) is plainly Defoe's.

(34.) "Reasons for a Royal Visitation, etc." (1717) is unmistakably Defoe's.

(35.) "Fair Payment no Spunge, etc." (1717) was attributed to Defoe at the time it was written, as we learn from another tract which I believe Defoe wrote, and it bears every mark of genuineness.

(36.) "A Brief Comment upon His Majesty's Speech, etc." (1718) is very probably Defoe's.

(37.) "The History of the Reign of King George, etc." (1719) is indisputably Defoe's and is specially interesting because in it he maintains firmly, long after the extent of his exaggeration was ascertained, the truth of his extraordinary and well-known account of the blowing up of the island of St. Vincent (cf. p. 229). In this connection, and in view of the great eruption of Mont Pelée in May, 1902, it seems worth while to call attention here to the article by Alfred F. Robbins in *Notes and Queries* for June 14, 1902, which pointed out the previously ignored fact that another London newspaper besides *Mist's*, viz., *Applebee's*, contained an account of the eruption of 1718. Mr. Robbins did not discuss the possibility, to my mind considerable, that Defoe was largely, though not entirely, responsible for the journalistic "dressing up" of both descriptions of the catastrophe.

(38.) "An Historical Account of the Voyages and Adventures of Sir Walter Raleigh, etc." (1719) is the most important item in Crossley's list. When I began to read it, I could not but believe that the great collector had been egregiously deceived, since the author of the pamphlet claimed, with reference to his hero, to "have the Honour to be related to his Blood." As I read on, however, the style seemed more and more to bear out the ascription, and on the last page I found a statement which tallied so completely with one made by Defoe in a letter to Harley that all my doubts vanished. Later, in other writings of Defoe, I discovered accidentally additional and strong confirmation of the ascription, and I am clear that a better case can be made out for its genuineness than can be made for at least three-fourths of the pamphlets and books that are unhesitatingly accepted as Defoe's. It seems worth while to add that the tract was written to supplement one by the subsequently famous Shakesperean, Lewis Theobald.

(39.) "A Brief State of the Question between the Printed and Painted Callicoes, and the Woollen and Silk Manufacture. etc." (1719) is, it seems to me, certainly Defoe's and contains a short passage which makes me query whether, when he was writing it, he was not gathering the information he afterwards used in one of the greatest of his books, "A Journal of the Plague Year."

(40.) "The Just Complaint of the Poor Weavers Truly Represented, etc." (1719) is certainly Defoe's.

(41.) "The Trade to India Critically and Calmly Considered" (1720) is certainly by the author of No. 39, and that author was Defoe and nobody else.

(42.) "The Interest of Great Britain Consider'd: or, The Herring Fishery Propos'd, etc." (1723) contains many things that justify Crossley's ascription, but others that render me unwilling to accept it without a reservation.

(43.) "The Tryal and Sufferings of Mr. Isaac Martin, etc." (1723) is a tract which purports to have been written by the man who underwent the tortures of the Inquisition that form its subject. Some features, especially the dialogues, suggest very strongly the supposition that he may have employed Defoe to tell his story for him, but I fail to find anything that warrants a very positive opinion on the subject.

(44.) "Some farther Account of the Original Disputes in Ireland, about Farthings and Halfpence, etc." (1724) is interesting, if only for the fact that it seems to be the sole tract that gives Wood's side in the controversy that occasioned Swift's famous letters. I am inclined to agree with Crossley in ascribing it to Defoe, but it should be noted that Mr. Henry R. Wagner in his bibliography entitled "Irish Economics" (1907, privately printed) thinks that the printing was done in Ireland, which would somewhat militate against Defoe's authorship.

(45.) "The Life of Jonathan Wild, etc. By H. D., Late Clerk to Justice R—." (1725)

is a tract regarding the authorship of which I find myself between two fires. I am by no means sure that Crossley is right in his attribution, yet I am less inclined to take sides against him than Mr. Aitken appears to be. I am more inclined to agree with Mr. Aitken in rejecting the next of Crossley's items,—

(46.) "Unparallel'd Cruelty: or, the Tryal of Captain Jeane of Bristol, etc." (1726)—a loathsome tract which Defoe can well spare from his voluminous works.

(47.) "A Brief Case of the Distillers, and of the Distilling Trade in England, etc." (1726) is also a tract Defoe could well spare, but much as I should like to reject it, I feel that it must be laid at his door.

(48.) "The Evident Advantages to Great Britain and Its Allies from the Approaching War, etc." (1727) is explicitly stated to be by the author of "The Evident Approach of a War, etc." (1727), which is No. 239 of Lee's list. There seems to be no reason for disputing either ascription.

(49.) "A Brief Deduction of the Original, Progress, and Immense Greatness of the British Woollen Manufacture, etc." (1727) is indisputably Defoe's.

(50.) "Some Objections Humbly Offered to the Consideration of the Hon. House of Commons, Relating to the Present Intended Relief of Prisoners" (1729) seems to be Defoe's, and so does

(51.) "The Perjur'd Free Mason, etc." (1730), although the latter is not an item on the genuineness of which a prudent bibliographer would lay a large stake.

(52.) "A Brief State of the Inland or Home Trade, etc." (1730) is, on the other hand, a pamphlet on the genuineness of which any reader of Defoe's "Plan of the English Commerce" ought to be willing to lay as large a stake as is ever warranted by internal evidence alone.

To sum up, of the sixty-one items in Crossley's list, one is now accepted by all, one—"What if the Swedes Should Come?"—is quite generally accepted, two seem to be mistaken ascriptions, and of the fifty-two (or fifty-three) others that I have examined I find only nine about which I have any real doubt. Of these nine, I suspect that over half are by Defoe, and of the forty-three (or forty-four, if there is a duplication of titles) remaining, I am inclined to hold that at least twenty-eight should be accepted as readily as almost any entry in Lee's list, and that the fifteen left are so marked by Defoe's characteristics that doubt with regard to them almost partakes of over-scrupulousness. Certainly Crossley, who was of much assistance to Lee, deserves to be remembered as the greatest of all authorities on what is perhaps the most tangled subject in English bibliography.

W. P. TRENT.

Correspondence.

VOYAGES OF THE NORTHMEN AND OF SEBASTIAN CABOT.

TO THE EDITOR OF THE NATION:

SIR: Every student knows full well that there is no finality about history. Such a subject, for instance, as the early history of North America gives us a very wide field, in which every industrious gleaner may still gather a few grains—some new facts that will help to solve the problems of our early annals. When the Original Narratives of Early American History were published, especially the one on "The Northmen, Columbus, and Cabot," I looked forward to obtaining new light on this very interesting subject. I must confess that I have been sadly disappointed. I take, for instance, the discovery of America by the Northmen. We all know that mixed up with fantastic fable in the Saga of Eric the Red is real history; we have only to study the map of the North Atlantic to see for ourselves how this wonderful discovery of America came about, five centuries before Columbus. Once these adventurers had found and colonized Iceland, the first north-easter would throw their frail craft on to the shores of Greenland; and then the further discovery of Labrador and Newfoundland was sure to follow. All this is very clear, and very simple. The remains of buildings in Greenland and the contemporary records place the whole subject beyond all doubt.

The vexed and unsolved question is the extent of their voyages in north-east America. We must always bear in mind that these daring explorers made their wonderful voyages in small, open boats, using their one lug sail only with a fair wind. Their expeditions were made in the summer, when the weather is often calm. With their oars twenty to thirty miles would be a good day's work. American historians seem to forget these evident limitations, and describe the voyages of these daring old pirates like trips in modern steamers. On their most southern voyage to Vineland, where they found the grapes, they had an encounter with the *Skrellings* or savages, in skin boats—undoubtedly Eskimos; no other aboriginal inhabitants but this race use skin boats; all the other Indian tribes had birch-bark canoes. The editor of the Original Narratives of Early American History declares, on the authority of John Fiske, that these savages in skin boats were not Eskimos, but American Indians. He strengthens this view, as he supposes, by declaring that the Northmen did not come in contact with Eskimos in Greenland. If we remember that these savages are coast tribes, who live by fishing and sealing, and are constantly moving about in their boats, the idea that the Northmen in Greenland had never met them, is absurd, and absolutely opposed to the records. Ari, the great authority on early Norse history, which the editor quotes, speaking of the Greenland colonies, says:

> They found there men's habitations, both east and west in the land, both broken cayaks [skin boats] and stone smithery, whereby it may be seen that the same kind of folk [Eskimos] had been there as *they which inhabit Vinland*, and whom the men of Greenland [the Northmen] called *Skrellings*, or dwarfs.

Any one can see at once that the encounter with the Eskimos in Vinland puts a definite limit to the Northmen's explorations. All American students of history are well aware that the Eskimos never went beyond Newfoundland. There is not a trace of their existence anywhere farther south. Nova Scotia and all the maritime provinces were then occupied by Micmacs and other branches of the great Algonquin family. In the map of the Icelander Stephanius (1570) Newfoundland is marked as Vinland. The northern part of the west coast of the island may well be described as flat in contrast to Labrador, "Helluland" (or stone land). The description of the sandy beach, with the fine salmon river, exactly fits in with St. George's Bay, on the west coast of Newfoundland.

I give no opinion, but every one must see that the encounter with the Eskimos puts a stop to the wild theories about the Northmen's voyages to Cape Cod and Boston. American history on this subject is an amusing comedy of errors. I can remember all the literature about the Norse baptismal chapel found at Newport, R. I.; how the learned Rafyn of Copenhagen rose to the seductive fly thrown on the waters by the fantastic Americans. Oh, tell it not in Gath! Publish it not in the streets of Ascalon! The baptismal chapel on which so much learning and eloquence was expended turned out to be an old stone mill erected by a former Governor of the Province. Then we have another absurdity: Leif's statue in Boston, erected by Professor Horsford to commemorate the great Northman's visit to the Hub!

We turn to another subject, the voyage of John Cabot in 1497. Here again our expectations of new light are sadly disappointed. Between the claims of John and Sebastian Cabot, the editor gives no definite opinion. It is time, at any rate, that this question should be settled. Unless all the contemporary records are absolutely false, Sebastian Cabot was no more in North America than in the moon. The letters written by the Italian and the Spanish Ambassador at the time tell us who went with John Cabot on his voyage—"a Burgundian and 16 English sailors." These also sailed with him on his second voyage in 1498. The second grant recited "the land found by the said John." The records of the Drapers Company, London, 1521, deny that Sebastian was ever in North America, and Martyr, Sebastian's most enthusiastic admirer, has to admit that the Spaniards absolutely denied his claim to be the discoverer of North America. Harisse has shown that Sebastian was one of the greatest liars of his age, a double-distilled Italian liar, and that every statement he made about his father and the voyages is proved to be wholly false.

It is at last time that this most absurd error, which is still to be found in almost every English and American history about Sebastian Cabot as the discoverer of North America, should be eliminated from text-books.

D. W. PROWSE.

St. John, Newfoundland, July 2.

Notes.

To the New Universal Library E. P. Dutton & Co. add "The True Travels and Adventures of Capt. John Smith," and "Rejected Addresses," by Horace and James Smith.

The second part of the Tebtunis Papyri, edited by B. P. Grenfell and A. S. Hunt, with the assistance of Prof. E. J. Goodspeed, will be published by Henry Frowde next month. The most important new fragment is that of the lost Greek original of Dictys Cretensis.

The Baker & Taylor Company makes the following announcements for the autumn: "The Autobiography of Oliver Otis Howard"; "History of Architecture," vol. ii., by Russell Sturgis; "The Appreciation of Literature," by George E. Woodberry; "The Apprcciation of the Drama," by Charles H. Caffin; "Building a Home," by Henry W. Desmond; "Browning's Italy,"

by Helen A. Clarke, and "The Story of Joseph," illustrated in color by G. A. Williams.

Duffield & Co. have become proprietors of the late Richard Hovey's books, "Along the Trail," "The Birth of Galahad," "The Marriage of Guenevere," "The Quest of Merlin," and "Taliesin." They announce for early publication a posthumous volume, "The Holy Grail and Other Fragments," with introduction and notes by Mrs. Hovey, and preface by Bliss Carman. This volume will contain Mr. Hovey's outline of the written and projected nine volumes that were to make up the Launcelot and Guenevere series. Other posthumous work of his is also in hand.

Later prizes announced by the Académie Française are as follows: Prix Gobert (9,000 fr.), to De Lanzac de Laborie for "Paris sous Napoléon"; Prix Thiers (3,000 fr.), to Éd. Rotb for "Histoire de la représentation diplomatique de la France auprès des Cantons suisses, 1430-1526," and to three others; Prix Archon Despérouses (for verse), to Mme. Hélène Picard and to four others; and the Prix Coppée to Alfred Droin for "La Jonque victorieuse."

The preliminary circular for the fifteenth International Congress of Orientalists, which is to meet in Copenhagen in August, 1908, has just been issued. A large committee has been formed of professors and prominent citizens of Copenhagen, including the Mayor, who, with Professor Vilh. Thomson as president, will have the preparations in charge. Membership is open to all Orientalists and to representatives of learned societies at a subscription of 18 kronen ($5) to be forwarded to the treasurer, L. Glückstadt, Holmens Kanal 12, Copenbagen; cards for the wives or daughters of members, 9 kronen ($2.50). The congress will be divided into seven main sections as follows: (1.) Linguistics, Indo-European Languages; (2) Languages and Archæology of Aryan Lands, subdivided into (a) India and (b) Iran; (3) Languages and Archæology of the Extreme Orient, subdivided into (a) China and Japan, (b) Indo-China and Malay; (4) Semitic Languages and Archæology, subdivided into (a) Aramaic, Hebrew, Phœnician, Ethiopic, etc., (b) Assyrian, (c) Languages and Archæology of the Islamic world; (5) Egyptian and African Languages; (6) Greece and the Orient; (7) Ethnography and Folk-Lore of the Orient. The progress of Oriental studies is reflected in the steady extension of the field covered by the congress. The creation of such sections as the last two is a sign that modern scholarship is alive to the larger problems that are apt to be swamped in the concentration on restricted fields. A special section for the Historical Study of Religions, which was included in some of the former congresses of Orientalists, has now been abandoned, because the increasing interest in this subject has led to the institution of separate congresses, likewise of an international character, to cover this subject in all of its divisions. The first of these was held in Paris in 1900; since then another has been held in Basel, and the third will take place in Oxford in September, 1908.

Among the forthcoming publications of Constable & Co. is a translation of Erman's "Handbook of Egyptian Religion," by Miss A. S. Griffith, sister of the well-known Egyptologist, Prof. F. D. Griffith. It is an account of the development of the ancient religion of Egypt from the first dawn of the history of the country to its overthrow by Christianity during the Roman occupation. It has explanations of many of the objects commonly found in collections, as well as of many that are unusual, and renderings of religious texts of special interest. The new volume is richly illustrated, and has a preface by Mr. Griffith. It also includes the original preface by Professor Erman, which he has slightly modified for the English version.

In response to a letter received from the United States commissioner of education suggesting that the American Library Association should coöperate with his department in the preparation of the next report of the Government on public libraries in the United States, the Council of the A. L. A. has voted that the matter be referred to the League of Library Commissions. It adds the recommendation that they report to the Council a plan for the preparation by the Bureau of Education of uniform library statistics, indicating items of first importance and a method of cooperation by which the library commissions in States where they exist may be utilized to furnish late figures. Through the cooperation thus planned and the use of a uniform code of statistics, it is expected that the next report of the Government in this field will have greater scientific value as a basis for sociological study.

In the *Daheim*, of Leipzig, No. 31, Prof. Paul Samossa discusses at considerable length the reason of the anti-foreign crusade that is making itself felt with increasing power in the academic circles of Germany. During the past semestre, out of 45,136 students enrolled in the universities, no fewer than 4,151, or 8.6 per cent., were foreigners; and of the 12,000 that constituted the student body in the Technological Institutes no less than 2,701, or 22.5 per cent., were foreigners. The Russians especially are crowding out the German students. Russia admits only a certain percentage of Jews to her higher educational institutions, and as a consequence those who cannot gain admittance go to Germany. The anti-foreign propaganda began in the Technological Institute, and has now spread to the universities, the chief reasons being the fact that particularly in the laboratories they crowd out the Germans, and that they make use of the knowledge and skill acquired at German schools to the detriment of German trade. Various methods have been suggested to counteract the evil. Several institutions have raised the tuition for foreign students; others have decided that foreigners can be enrolled only after the Germans have had the first chance during the first weeks of a new term. These means have, however, not proved effective, and at a recent convention of the university rectors the first was strongly condemned as unwise. Professor Samossa does not excuse entirely the German universities in this matter, asserting that several of the universities have made the doctorate examination so easy for foreigners that in some countries, notably America and Holland, the German doctor of philosophy is not highly respected. He believes that the German Government will be compelled to take some radical steps in this matter.

John R. Spears, the well-known naval writer, is the author of "A Short History of the American Navy," published by Charles Scribner's Sons. Since it has appeared under the auspices of the new Navy League of the United States, it is obviously intended to be used for propaganda purposes. Interestingly and compactly written, it cannot, however, claim consideration as a serious historical study. One example of the loose style of the navy boomer which marks it will suffice. Speaking of the growth of the movement for a modern fleet in the early eighties, Mr. Spears says, that the agitation was continued "until the nation saw that the condition of affairs then existing was not only humiliating and destructive of the moral fibre of the people, but it steadily invited aggressions and actual war." A more reckless and unfounded statement it would be hard to find; every intelligent student of our history from 1865 to 1898 knows this. Yet this is but a keynote of the whole book.

Prof. J. M. Hart's "Development of Standard English Speech in Outline" (Henry Holt & Co.) is substantially an abridged Middle English phonology, with consideration, however, of the main sound changes in Old and Modern English. We confess ourselves not in sympathy with the object of this work. Such a book could, of course, only be intended for graduate students in our universities. But we are convinced that it is a mistake to give such students the idea that the task confronting them is simpler than it is. All the probabilities are that a student who has spent a good deal of time in mastering a treatise like this will be quite content with what he has learned from it, and will feel about Sievers, Ten Brink, and the other standard authorities very much as Chaucer's easy-going monk did about St. Augustine's injunctions to hard work: "Lat Austyn have his swynk to hym reserved." It is characteristic of Professor Hart's point of view that he declares himself in his preface as "more than puzzled by the air of confidence with which the German school blocks out mediæval England in squares like a checkerboard, and assigns each bit of writing, from Layamon's Brut to the 'Alliterative Poems,' to its particular square." Now, the variety of Middle English dialects is a most annoying fact, but surely the Germans have already sins enough to bear, without being made responsible for this. In conclusion, we need hardly say that the information given in this little book is sound, and it is only on the question of aim that we take issue with its author.

Two well-known studies in Roman history have recently appeared in new editions. W. T. Arnold's "Roman System of Provincial Administration," which originally came into being in 1879 as "the Arnold Prize Essay" of that year, has been revised from the author's notes by Dr. E. S Shuckburgh and published by B. H. Blackwell, Oxford. The editor has occasionally rewritten a paragraph or inserted new material, and has added fresh citations of authorities, but the work is still in the main Arnold's. It would be easy to suggest further improvement. The corpus of Latin inscriptions should be used more freely. References to such works as Marquardt's

"Römische Staatsverwaltung" should be made to the last edition. More attention should be given to the correction of misleading or inaccurate statements. The class of provincials, for instance, spoken of on p. 210 as "wretched," was, in fact, exceptionally fortunate. It is greatly to be regretted that the death of the editor while the volume was in press has not only left the revision unfinished, but more especially has deprived classical scholarship of an able, conscientious exponent. With the substantial merits of the first edition students of Roman history are well acquainted; and they will find the present volume even more serviceable. In its field it has no rival in English. Far less important is the new edition of S. Baring-Gould's "Tragedy of the Cæsars," published by Charles Scribner's Sons. The judicious reader will be disposed to find fault with the extreme partisanship shown in the treatment of the various emperors. To prove Tiberius a great ruler and an admirable man, it is unnecessary to disparage every one opposed to him. The minute diagnosis of Nero's alleged insanity, adopted by the author from a certain Dr. Wiedemeister, will find little credit among those who have followed the inconsistent testimony of alienists in recent criminal trials. As the title of the book indicates, the chief interest is in the personal character of the Cæsars. The study of their portraits is a real contribution to history. Even if the reader cannot trustingly accompany the author through the details of iconographic analysis, at all events he will find the interpretation suggestive and stimulating.

Prof. Adolf Harnack, the brilliant critic of the Berlin theological faculty, is surprising friend and foe by his recent conservative results in his investigation of of the book of the Acts. His late work, "Lukas der Arzt," was a decided advocacy of the traditions which made the third gospel and the Acts the products of the same author; he has now supplemented these researches by a special investigation of the "Zeitangaben der Apostelgeschichte des Lukas." which he submitted to the Philosophico-Historical Section of the Berlin Academy of Sciences, and which is published in the Transactions. It is substantially a defence of the unity and historical credibility of the book from a new point of view, namely, the chronological, particularly by bringing the chronological data of Acts into connection with the recognized facts of secular history. He asserts that the contents of Acts are historical; and thinks also that the so-called "We Sections" of the book belong to its kernel, and cannot be separated on the ground of being the product of a foreign author. Harnack's rejection of the Tübingen critical views is regarded in conservatively inclined periodicals as evidence that the high tide of negative criticism of the New Testament has been reached, and that the waters are now receding.

Adolphe Lejeune-Choquet's "Histoire militaire du Congo" (Paris: Berger-Levrault) will disappoint those who take it for a connected military account of the Congo. It is rather a record of the various explorations, expeditions, combats, etc., that have taken place, with such historical, geographical, and political chapters as may serve to round out the subject. It will also disappoint those who may consult it in search of arguments against the King of the Belgians. But the book is nevertheless of interest and value within its limits. There are many illustrations, besides sketches of the numerous military operations. Although the Congo has been "colonized" since 1876, we note that but 1,493 Europeans are reported in 1905, as compared with 25,000,000 negroes, the area of the country being nearly a million and a half of square kilometers.

The language question in Norway has been at least temporarily settled by a law passed during the present session of the Storthing. After the lapse of a certain number of years every young man who desires to enter the university must by a written thesis prove that he is able to handle in writing not only the usual literary language (Dano-Norwegian), but also that language which, under the name of landsmaal, represents the literary common denominator of the several country dialects. Under these circumstances the Danish-Norwegian Dictionary (*i. e.*, a dictionary giving the Norwegian equivalents of the Danish words of the regular literary language) now being issued by S. Schjött is extremely timely. It will also prove of interest to foreign students who wish to get an insight into this allegedly artificial language, which is, nevertheless, embraced with the greatest love and enthusiasm by its adherents and can show a literature steadily growing in value and quantity. Schjött's dictionary will appear in about eighteen parts of sixty-four pages each; three parts have so far been issued.

Henrik Jæger's "Illustrated History of Norwegian Literature" (Illustreret Norsk Literaturhistorie), in three volumes, valuable though it be in many respects, carries the subject down only to the year 1890, and its references to the younger generation of authors, who had already made their appearance by that time, are extremely meagre and unsympathetic. This gap has now been filled by Carl Nærup's "Illustreret Norsk Litteraturhistorie, 1890-1904" (Det Norsk Aktieforlag, Christiania), a volume in large 8vo of 264 pages, giving sympathetic accounts of the lives and works of the whole younger generation of Norwegian writers. Although none of these writers may ever attain the fame of the two great Dioscuri of Norwegian literature, Ibsen and Björnson, there are several of them who well merit a closer acquaintance, and nobody could wish for a better guide than Nærup's volume. The book is profusely illustrated, and of special interest in this respect are the renderings of Vigeland's characteristic portrait busts of Ibsen, Garborg, Hamsun, and Obstfelder.

The first part of vol. vii. of Worthington C. Ford's edition of the "Journals of the Continental Congress" (Washington: Government Printing Office) covers the period from January 1 to May 21, 1777. The details of military affairs still form, naturally, the larger part of the record. The custody and exchange of prisoners, the treatment of deserters, and of the persons, apparently no inconsiderable number, who harbored them, and the defence of the western frontier, were frequently before Congress for consideration; while the vain hope of getting possession of Nova Scotia had not yet been dissipated. Elaborate reports on the establishment of army hospitals and the impressment of wagons and carriages were presented. A plan for the organization of a Board of War was submitted April 8; a few days later the national arsenal was located at Springfield, Mass. The hostility of Congress to Gen. Schuyler, in large part due to the machinations of Gates, is shown in resolutions of March 15, in which some expressions used by Schuyler in a letter of February 4 are sharply condemned as, "to say the least, ill-advised and highly indecent." Schuyler apologized, and on May 8 was restored to favor. The presence of French and German volunteers in the army was causing trouble, and on February 18 Washington was directed to dismiss such "French gentlemen" as he deemed unfit; while on March 13 it was voted to instruct the American representatives abroad to discourage the coming of persons who could not speak English. Repeated efforts were made to induce the acceptance of the Continental bills at a parity with specie, to provide for their redemption and the payment of the debt, and to check the issue of paper money by the States. In the field of foreign affairs the most important steps were the appointment of Franklin and Arthur Lee as American representatives at the court of Spain, and the transformation of the old Committee of Secret Correspondence into the Committee of Foreign Affairs, with Thomas Paine as secretary. Mr. Ford's notes are, as usual, informing; the restorations of passages from the manuscript journals, however, are somewhat less numerous than in previous volumes.

Prof. Kuno Fischer, historian of the newer philosophy at Heidelberg, died last Thursday. He was born at Sandewalde in Silesia in July, 1824; studied philosophy, philology, and theology in Leipzig and Halle, and with the publication of a thesis in the Platonic style entitled "Diotima, die Idee des Schönen," he qualified for the privilege of lecturing on philosophy at Heidelberg. But the academic career which had opened so auspiciously came to an untimely end with an order issued by the Bavarian ministry prohibiting him from public teaching. After various changes, he was, in 1872, recalled to the university which had disowned him, and there passed the remainder of his life. He became, indeed, one of the most prominent figures in the old university town which resounds with anecdotes of his life in and out of the classroom. He was as much a local institution as Heidelberg Castle itself, and his loss will deprive the university of its most brilliant teacher.

His principal work, the "History of Modern Philosophy," exhibits the quality of clear thinking and the ability to follow out a theory in all its ramifications. These traits rendered him an admirable controversialist, and one of his most noteworthy achievements was his argument with Trendelenburg on the philosophy of Kant. Like some others, Fischer for many years had laid special stress upon the teachings of Kant, and had held that the critical philosophy could not be neglected without serious detriment. In 1862 he published a treatise on

the two schools of Kantian philosophy at Jena. His "Logik und Metaphysik" (1852), published at Heidelberg in 1865, is a systematic treatment of philosophical problems which in contents and method belongs to the school of Hegel. In addition to his more formal treatment of metaphysical themes, Fischer was deeply interested in the philosophical aspects of German literature. His studies of Schiller, entitled respectively, "Die Selbsthekenntnisse Schillers" (1858), "Schiller als Philosoph" (1858), and "Schiller als Komiker" (1868), have since been collected under the title "Schiller-Schriften" (1891). His treatment of Lessing and Goethe is equally noteworthy. Of the latter poet, he made a profound study, incorporating his impressions in several volumes now collected under the title "Goethe-Schriften," comprising studies upon the inception and composition of "Faust," "Iphigenie," and "Tasso."

Dr. Elseus Sophus Bugge, professor of languages at the University of Christiania, who died on Monday, was the best-known philologist of Norway. He was born at Laurvig, Norway, in 1833. After studying at the University of Christiania he proceeded to Copenhagen and Berlin. So early as 1854, he began to write on the old folk poetry of the Norseland, and in 1858 he printed a scholarly translation of a collection of Norwegian Folk-Songs, with commentary. In 1866, he was appointed to the newly created chair of comparative philology in the University of Christiania. His first edition of the songs of the Edda, published in 1867, still ranks as one of the best critical editions, if not the best, which have appeared. One of his best-known works is the studies into the origin of the heroic and mythological sagas of Norway (1882), which was particularly well received in Germany. In 1891, Professor Bugge began the publication of a complete set of the Norwegian monumental runic inscriptions. He was elected in 1881 a corresponding member of the Académie des Inscriptions et Belles-Lettres of Paris. His death is looked upon in Norway as a national loss, and the Storthing has voted a State funeral.

RECENT VERSE.

One of the most satisfactory books of closet drama of the extreme type that we have lately seen is G. Lowes Dickinson's "From King to King" (McClure, Phillips & Co.), written some sixteen years ago, and now republished to profit by Mr. Dickinson's success in another field of letters. There is in the piece no pretence of dramatic structure; yet the effect of the whole is highly—in the closet sense—dramatic. In a series of Landorian imaginary conversations, some in verse, some in prose, beginning with "Eliot and Hampden in the Tower," and concluding with "Vane on the Scaffold," we have a vivid presentment of the pregnant cross-purposes, the conflicting idealisms, which divided the manhood of England in the days of the great civil war. Mr. Dickinson's thesis, if an imaginative clue to a whole historic period may he so called, is finely put in four lines from a speech of Cromwell's:

But while we wear our flesh, there's contradiction,
Action and counteraction; 'tis the law
Makes life itself another name for battle,
And labels peace death.

Many of the dialogues which compose the piece contain a stirring clash of personalities, revived with convincing sensitiveness. This sensitiveness, as well as Mr. Dickinson's capacity in versification, is seen to advantage in the concluding speech of Milton in a colloquy with his former tutor, Young:

O thou,
Who once, from Heaven descending, didst illume
With hallowed altar-fire and tongues of flame
Thy chosen saints of Pentecost; on me
Though later born, to utt'rance less divine,
Such grace bestow as, kindling all within,
May prompt prophetic song, not all unfit
To celebrate thy people's praise and thine!
. . . . . .
Purge and prove
Thy people's heart! give them a single purpose!
That so their acts, wedded to prayer and praise,
May blend harmonious concord, apt to charm
Even angelic ears in Paradise;
Where round the burning throne eternally,
Seraph to seraph, saint to saint responsive,
With silver trump and harping symphonies,
Peal in a choir immortal hallelujahs.
To such attune, though weak, my mortal voice,
That, while this island-nation, born anew,
A golden eagle, beats her dauntless wings,
Undazzled, full, against the blaze of noon,
I, with not too presumptuous aim, may sing
Her praises right, nor, honoring her, forget
To celebrate, as due, Thee, sole Supreme,
Thee first, Thee last, and Thee eternally!

The leisurely and catholic reader can but regret that Mr. Dickinson has, apparently, forsworn verse, and given himself over to the cultivation of imaginary conversations in prose.

A rather similar piece of dramatized history, though with a more compact and conventional structure, is "Sir Walter Raleigh," by H. A. A. Cruso (T. Fisher Unwin). Mr. Cruso has read the literature of his subject diligently and recaptured something of the temper of "the spacious days." Poetically considered, the performance is a little languid, yet it can be read without undue effort.

"The Coming of Philibert," by Sara King Wiley (The Macmillan Co.), is an interesting bit of dramatic blank verse which just misses distinction. The fable, though a little reminiscent of Calderon's "Vida es Sueño," is sufficiently novel and happy. A wise king, being the father of twin princes, endeavors to avoid future dissension by having one prince educated at court as his successor, while the other is reared in an Arcadian solitude by a woodland philosopher, in ignorance of his royal claims. Brought back to court by his reigning brother, the forest-bred prince, with his naïve veracities, acts as a kind of touchstone whereby the intrigues of the courtiers and the ineptitudes of their monarch are seen for what they are. After a variety of adventures, sentimental and martial (the piece is dedicated to Theodore Roosevelt), the ruling brother politely gets himself out of the way by suicide, and we behold his rustic twin firmly seated upon the throne of Artacia, and in the way to become a benign and masterful monarch. The play is intelligently put together, though we do not feel that the writer has exhausted all the dramatic possibilities of a rather unusually suggestive *donnée*. The versification is correct, but not notable.

The likeness that we ventured to point out some time since between the dramatic temper of Cale Young Rice and that of the dramatists of the Elizabethan decadence is seen yet more clearly in his latest volume, "A Night in Avignon" (McClure, Phillips & Co.). This brief poem which, by the expedient of arbitrarily breaking the iambic pentameter into trimeters and dimeters, is made to fill a volume of thirty-two pages, presents a night in the life of Petrarch, in which, Laura being cold, he turns to a lighter love, only to be visited by the Signora de Sade, in a mood platonically melting, and to be by her disowned for his meditated infidelity. The situation is conceived with an admirable intensity, but it is worked out with such agitation of mood and manner that it fails to be pleasing or even convincing. It is a cause for regret that a poet of such gifts of imagination and phrase as Mr. Rice should persistently destroy the possibility of pleasure in reading his work by failing to put the slightest artistic curb upon his mood, by persistently overleaping all bounds of artistic decorum. In the present instance the excesses of temper are aggravated by haggard and melodramatic punctuation. The following, in which the dots are Mr. Rice's, is a not unfair specimen of the utterances that he puts upon the suave lips of the father of humanism:

There in the cloister have you peace—in prayer?
In visions—penances? . . .
Swear that you have! swear to me! once! . . .
but once!
And I . . . ! . . .
No, never! . . . never!
(He wipes his brow)

A lover of Petrarch turns with relief from this to Miss Agnes Tobin's "On the Death of Madonna Laura" (Heinemann). Miss Tobin has rendered into English Petrarch's entire second cycle, and, as a whole, has done it admirably well. In fidelity to the original, as well as in evenness and sincerity of tone, Miss Tobin has not been surpassed save in a few sonnets Englished by master hands. A good sample of her work is the fifteenth sonnet of her cycle:

You have discoloured, Death, the loveliest face
That ever was, and quenched the loveliest eyes;
Forcing the locks and breaking all the ties
Of a keen soul in a most lovely case.
An instant all my good doth blast: O base!
On those soft lips your heavy finger lies,
That spoke so sweet, and you endure my cries.
I wander blind with tears from place to place.
'Tis true my lady comes to help me then
When Love and Pity lead her by the hand:
No other succour holdeth life for me.
And if her speech, and if her gesture grand
I could impart, I would transform, not men,
But tigers, bears, and monsters of the sea.

Yet good as this is, in its grave tenderness of tone, its characteristic Petrarchian *morbidezza*, it is in certain details a striking illustration of the proverb, *traduttore traditore*. How weak, for example, is Miss Tobin's fifth line compared with its original, which depends, like the lines before it, from *Morte* as a subject,

In un momento ogni mio ben m'hai tolto;

and how pale is "transform" in the penultimate verse as a rendering of *accenderei d'amore*. These, however, are but evidences of the difficulties that stand in the way of perfect translation. They are not to be considered as serious blemishes in Miss Tobin's work unless it be that the first instance, which is rather characteristic, indicates a lack of full perception of the importance of close syntactical concatenation in sonnet structure.

The "Selection from the Verses of John

B. Tabb," made by Alice Meynell (London: Burns & Oates), is a fairly satisfactory exhibition of the quality of that keenly individual poet. With a curiously insinuating, personifying imagination that winds itself into odd crannies of nature and human life, Father Tabb combines a gift of quaint and pregnant poetic expression. He has something of the concettists' way of playing with recondite images and the radical meanings of words, and something, too, of their alchemical power of refining out the dross of a poetic idea and giving us only its molten gold perfectly fused in melody of twelve short lines. Add to this that Father Tabb has in a high degree the modern imaginative scientific sense of the far-reaching inter-relations of life, though it takes from his temperament a weird and shadowy hue, and we see the source of the haunting suggestiveness of his tiny lyrics. Like the pin-pricks which the experimental psychologists employ to determine the sensitiveness of the nervous system, his verses are a singularly efficient test of poetic sensibility. His pieces all contain such riches in a little room, and are all so tempting to quote, that we shall here present three of them:

THE PLAYMATES.

Who are thy playmates, boy?
"My favorite is Joy,
Who brings with him his sister, Peace, to stay
The livelong day.
I love them both; but he
Is most to me."

And where thy playmates now,
O man of sober brow?
"Alas! dear Joy, the merriest, is dead.
But I have wed
Peace; and our babe, a boy
New-born, is Joy."

OUTLINES.

O frame me in thy love, as I
The landscape in the branches low;
That none beneath the bending sky
Our sylvan secret know.

For 'tis of Life the mystery
That wheresoe'er its fibres run,
In time or in eternity,
The many shape the one.

O'ERSPENT.

My soul is as a fainting noonday star,
And thou, the absent night;
Haste, that thy healing shadow from afar
May touch me into light.

We have before us twenty-one thin volumes of verse published by Mr. Badger. The diligent perusal of them fails to reveal any traces even of mediocre poetic talent, save in the case of the thinnest of them all. The handful of brief lyrics in "Cobwebs," by Gertrude Rogers, are a pale distillation of old poetic symbols. Yet in the iterative melody of her "Horns of Elfland" and "shattered strings" there is, as in this lyric, a certain wan, appealing charm:

The flames of the autumnal fires
Are dying fast,
Leaving but embers of desires
Whose warmth is past.
November by the ashes stands
Silent and pale;
Trying to warm her chilly hands
By fires that fail.

A somewhat ampler quality is discoverable in a more ambitious collection entitled "When Yesterday was Young," by Mildred I. McNeal-Sweeney (Robert Grier Cooke), though the book as a whole is perhaps less effective. Mrs. Sweeney's verse in both conception and phrase is the product more of fancy than of imagination, and a book the size of this can scarcely be energized save by the latter. Mrs. Sweeney's persistent experiments with broken line stanzas are seldom very successful, though occasionally, as in "The Wind," she hits a pretty tune, and one capable of giving pleasure, if we refrain from too closely scrutinizing the phrasing:

O'er beds of purple thyme
It blows
And inly glows
With faint and fragrant rhyme.
The rose
Scent, too, it knows,
From tarrying where they climb
In sweet hedge rows.

It haunts the heart anew
With dreams
Of heathery hills, and gleams
Of gold gorse, glowing through;
And teems
With dusky beams
Of bending ferns that grew
By laughing streams.

Alilt on lustrous wing,
Again
Through dew-lit lane,
It wanders, pleasuring,
And fain
Would tempt the strain
Yon heaven voiced thrushes sing
In far refrain.

The salt breath of the sea
O'er miles
Of moor, beguiles
The longing memory;
And smiles
Of the sunny spray like the wiles
Of a girl, come happily
From storm-throned isles.

It touches, too, I know,
The worn
Wood path—the corn—
The lilacs bending low
Each morn,
And sets the thorn
About the door aglow
Where I was born.

In the Preface to "Nineveh and Other Poems" (Moffat, Yard & Co.), George Sylvester Viereck protests that his poems must not be judged from the point of view of a Puritanical morality. It is not our intention to introduce any ethical considerations here, yet considering the poems in themselves as works of art, we cannot but regret that a young poet of such remarkable imaginative endowment and technical mastery as Mr. Viereck should have allowed himself to be so exclusively and monotonously occupied with a single theme: he is the celebrant of Ashtoreth, Lilith, Pasiphaë, Sappho, Cleopatra, Faustina, and Salome—and of "Mr. W. H." and Antinous! His mood is that of Whitman's "Children of Adam," touched with a precocious satiety that vitiates the artistic result. Even Mr. Viereck's sustained energy of phrase and the fine orotund music of his verse hardly avail against this vicious monotony of subject. The subject, however, is fortunately taken not so much from life as from a rather narrow segment of poetic literature. There is good ground for the hope that Mr. Viereck may grow away from these earlier moods and masters, and give us poems in which a nobler meaning inspires his admirable form. In the meantime the source of his earlier impulse, as well as the admirable form, may be perhaps most discreetly revealed in this resounding sonnet "To Swinburne":

Eloquent master, thy melodious rage
Our latter song may not aspire to reach!
Our eyes beheld the magic of thy speech
Conjure the love-queens of a perished age,
You, clothe with life their spectral forms, and wage,
When the sight stung thee, war with Heaven for each:
Only the rolling anthem of the beach
Could break the spell and end thy vassalage.

The sea, thy true love, taught thy lyric tongue
The mighty music of her mutiny:
Thy voice as hers the ages shall prolong,
And, praising numbers, men shall ask of thee:
"Is it the sea that thunders in his song,
Or is it his song reverberates in the sea?"

"The Happy Princess and Other Poems," by Arthur Davison Ficke (Small, Maynard & Co.), is the sort of book that always gives the critic pause. The collection is clearly premature, yet along with a good deal of vagueness and ineptitude, there goes so much of melody and imagination, of the poetic sense of life, that one hesitates to apply to it the more rigorous standards of poetic art. There is in the book no single gleaming and memorable piece, yet often, as in this concluding section of an ode "To Fancy in the Later Days," the intention and much of the execution is admirable and memorable:

They have forgot. The fairest things
Pall; and they seek their joys in strife,
Panting for what the morrow brings,
The fleeting morrow of worn life.
The silences of twilight hours,
The voices of each woody spot,
The very beauty of small flowers,
They have forgot.

The sunset burns for them in vain.
To them the sacramental dawn
Is but new lease of trivial pain
Which must be drowned in pressing on
To strange fierce joys. No milder balm
Brings any easing of their lot.
The soft, the beautiful, the calm,
They have forgot.

They pray to God with hope of heaven;
Yet nightly have no heart to see
Orion and the shining Seven
Move through the dusk's infinity.
—What if to them the death-hour brings
Knowledge which life has given not—
That heaven lies in the little things
They have forgot?

Fancy, crowned in heaven of old,
Bring again thy sacred gold
That our days fade not in cold.
Cast thy light upon the flowers
Blooming round the weariest hours,
And in bosoms make thy home
Whence the visions all have gone.
Thou canst build that godlike state
Past the bitter blows of Fate;
Thou canst make the heart stand free
Even from its own agony;
And in the light thy coming brings
The soul looks up, Lo! and has wings!

Mr. Ficke has to learn what to leave out, and to recognize that even in poetic style the happy phrase is that which flies like an arrow to the goal, not that which plays about the mark like a garden-hose, however charming the rainbow tints that sparkle in its spray.

CURRENT FICTION.

A Winged Victory. By Robert Morse Lovett. New York: Duffield & Co.

All the virtue of this story lies in the first of its three parts. Here is an affectionate and reverent study of child-nature, grateful enough in the midst of our sentimental or facetious or condescending manipulations of the child as literary "copy." Three children are concerned. Their father is a sporting gentleman, or gentle-

man sport, who, in a flush hour, has become possessed of a large country estate not far from Chicago. Fortune's wheel takes its customary turn, and when the story opens the children are living half-cared for upon the half-abandoned place, while the father remains in the city, trying all expedients except that of hard work, to recover his always precarious position of affluence. He is a gambler by nature, and after the action begins the cards turn persistently against him. The oldest child, Linda, is adopted by a rich and worldly Chicago aunt, who offers to take the second girl, Dora, also. But Dora refuses to leave her little brother Peter, and the two remain at the old place under the care of a single retainer. They go to the village school, where the little brother makes almost no progress, in spite of all his sister's efforts. Gradually it dawns upon her that he is not as other children—a discovery which only makes her love more fiercely maternal and self-sacrificing. The fatal accident which snuffs out the little "natural," deprives the sister of her main object in life. With his death the first part of the story ends—a love-tale complete in itself.

The other parts read like tame sequels; Dora herself becomes commonplace and ineffective. Presently we find her in a Western co-educational institution, which it is not hard to identify with the University of Chicago. Two youths, fellow-students, become involved in her fate: a desirable one whom she has always known, and an undesirable one, whom she proceeds to marry. He is one of your flabby poets, all hair and hysterics, whom sensible women marry out of pity. This one commits suicide in the end, when, of course, the better man takes his leavings. Of the minor characters, one Constance Dare has a bad eminence, uniting all that is most disagreeable in the "co-ed" to all that is most crude and facetious and "fresh" in a certain type of Middle Western girl. The most distressing thing is that one is evidently expected to admire her on the whole—Dora does. For her part of the story, as for the poet's, there is little or nothing to be said. But the Dora part, the child-Dora part, is matter for gratitude and for remembrance.

A Woman's War. By Warwick Deeping. New York: Harper & Bros.

Notwithstanding a certain crudeness, in "The Slanderers" Mr. Deeping gave an appreciable promise of power and imagination. In "A Woman's War" the crudeness remains.

Having chosen a painful but live contemporary theme, he proceeds to treat it with a childish superficiality. A small country town boasts two rival doctors. Parker Steel is incompetent, greedy, and dishonest. Betty, his wife, is a real villain; she resembles the wicked Polish countesses of early German fiction. Dr. Murchison, on the other hand, possesses all the virtues, and his wife is even better than he. Unfortunately, he is an hereditary dipsomaniac, and, in spite of constant and heroic struggles, when the story opens, succumbs to temptation almost as often as confronted with anything to drink.

Owing to the virulence of public opinion and the machinations of his enemy, Dr. Steel, Murchison loses his practice, for the mere trifle of a sponge and a forceps sewed up in a patient who thoughtlessly exposes him to the revelations of an autopsy. He is driven to dispensary work in an unhealthy town where his little girl dies. Her death, however, lifts "the curse" from him, and he bravely returns and hangs out his shingle in Roxton.

Parker Steel, meanwhile, . . . but, really, the exact piece of carelessness through which he comes to grief is hardly mentionable outside of the lecture room. It may be asked why any amount of negligence on his part should cancel the scandal of the sponge and forceps. Nevertheless, by the rules of the game, in this kind of novel, the old score is wiped out, and the book closes with a grateful populace pulling Murchison's carriage through the streets of Roxton.

The Flying Cloud. By Morley Roberts. Boston: L. C. Page & Co.

If the reader can once get over the rhapsodical opening chapters of this very good tale of the sea, he is probably in no danger of abandoning the gallant Flying Cloud till her long voyage from Britain is over, and the Australian shore swims into sight on the last page. It is quite an achievement to spin more than three hundred pages of narrative practically without a plot. A thread of human interest does run through the story in the form of an opium-eating skipper, who is very successfully worked out, but the real hero, heroine, circumstance, and occasion, is the Flying Cloud herself. First she wallows in the Bay of Biscay, then she drifts across the Tropics, then she staggers around the Cape and into port through one of the most magnificently pictured hurricanes in contemporary fiction; and that is all. The personality of the Ship, which Mr. Roberts dwells upon so fondly and insistently, we, too, readily come to feel and acknowledge towards the end of the book.

The Hill of Dreams. By Arthur Machen. Boston: Dana Estes & Co.

Continental fiction conducts the warfare of the flesh frankly in the flesh. Many people object to this, but compared to a fashion now gaining vogue in England, the French method seems almost wholesome. In "The Hill of Dreams," Mr. Machen confines his young man's struggle to the field of imagination alone. When Anatole France does this, he stages his picture upon the banks of the Nile, among hysterical early Christians. In modern Paris, the story of Thaïs would be distasteful, possibly because few young Frenchmen (except such museum pieces as Madame Tinayre's Augustin) are worrying to-day about their souls. Then, like Fogazzaro's Benedetto, Augustin was purely religious, and temptation assailed him in the shape of one woman. Not so Lucian Taylor, our present young man. It was "No love of a woman, but the desire of womanhood, the Eros of the Unknown, that makes the heart tremble." Lucian constructs a dream city into which he can retire at will, and witness various spectacles, some highly noble, others — discreetly veiled by the author under a few mystical allusions — of a less edifying nature. Lucian invents a "ritual" for himself, and with the aid of plenty of good sharp thorns well driven into his flesh, he learns to "taste in all its acute savor the joy of physical pain."

There is a great deal about the incredible secrets of Gothic art, about beauty, about "secret practices" and "Barbarians." The barbarian aunt who wished Lucian to get a place in some bank and earn a salary will have the full sympathy of every normal reader.

Although written with noticeable ability, the book in itself has not sufficient strength to deserve attention here, did it not mark a curious morbid phase of English fiction in which sound, color, and scent are put to superfine uses by neurotic young gentlemen who should be shut up, or set at manual labor. When a young writer (of course, Lucian was an abortive poet) feels that "Literature is the sensuous art of causing exquisite impressions by means of words," he had better purge his mind of Pater, De Quincey, and Poe, and of its contempt for Philistia. Like Balzac's painter, Lucian dies leaving his masterpiece a chaos of unmeaning lines, and leaving upon our minds the impression that the redeeming quality of such symbolism run riot must be the small likelihood of its exerting the faintest influence.

His Courtship. By Helen R. Martin. New York: McClure, Phillips & Co.

This is a short story which made up its mind to grow into a novel, and got spoiled in the process. With material at hand for the creation of a very attractive bit of life in fiction, in the shape of a vividly real Pennsylvania Dutch farmer family, speaking a fascinating jargon, the writer has done what our masters of local color will undoubtedly continue to do for long years to come, and, instead of developing her story from the nature and necessities of her *milieu*, has attempted to run her good virgin material through the antiquated machinery of clap-trap plot and situation. To introduce into the primitive atmosphere of the Morningstar farm the immemorial kidnapped child of very wealthy and refined parents; to bring her into contact with the very paragon of a young and handsome professor of psychology, who runs away from women, and is by them, nevertheless, pursued; to bring the same beautiful lily of the farmyard into contrast with certain wonderfully conceived women of the world, for that sole purpose created—all this is seemingly dictated by the mere necessity of filling space. The technique is at times startlingly jejune. Because the Morningstars say: "Pop, he wrote 'em a postal in, last Saturday's a'ready, tellin' 'em they have the dare to come Wednesday dinners," the town boarders must say by contrast, "Our creature comforts are of such minor importance. Material things absorb most of us too much; don't you think so?—leaving us too little time for the things that are really worth while in life. . . . Remember, dear, the simple life is subjective as well as objective."

The Development of Religion in Japan. By George William Knox. New York: G. P. Putnam's Sons. $1.50 net.

Dr. Knox uses the singular number with correctness. Japan has many religions, yet her religion is one. The ordinary sub-

ject of the Mikado does not draw lines of demarcation between Shinto, Buddhism, Confucianism, or even Christianity. Shinto is the national memory. It would be hard for a native without great powers of discrimination and critical knowledge of history to tell just in what it consists. It has almost nothing tangible. Until an outside form of faith was imported, the cult had not even a name. Buddhism is the heart of the nation, and has been the greatest unifying influence. Without Buddhism, despite government, it would be difficult to think of the Japanese as a nation, and not a mere conglomerate of tribes. Confucianism furnishes the universal ground of ethics, and in its modern restatement is the creed of a scholarly minority. Christianity, though professed by thousands and felt by a million, cannot in the perspective of history be called one of the religions of Japan. It is beyond cavil, however, that some Shinto sects imbibed features from that Iberian Christianity, publicly known in Japan for one century, and secretly nourished by a few thousands two centuries in seclusion. Hence, though Dr. Knox glances at the future, the substance of his six lectures treats of the three religions—indigenous, Aryan, and Chinese—which form a composite in the mind of the average native. The religion of the Japanese cannot be understood apart from history. It is not to be found by a study of the systems as given in the Sacred Books, for it is at once more and less than they. Hence the enormous advantage possessed by Dr. Knox, who, as a critical student dwelling in Japan during fourteen years, corrected theory by observation.

His two lectures on Shinto show us the Way of the Gods, which arose and developed among the various tribes, Malay, Aryan, and Tartar, possibly even Semitic, as the religion of nature, without formula or other objects in view than the expression of tribal ethics and human emotion. The powers of nature were personified. The first visible embodiment of the gods was probably a row of carved posts, such as we see in the Pacific Islands and Korea. Unquestionably, phallic worship was predominant. Then there grew up a mythology which shaped itself through the struggles of the various tribes, until one, the house of Yamato with its Mikado, became dominant. The stories were now reshaped and colored with a purpose, that is, the support of the Imperial House and power. Thus Shintoism, becoming in its second stage a political engine, took on something of the form of an organization, by which all the tribes and nations were unified under the dogma that the Mikado and his ancestors had come down from heaven and had been given divine authority. After this, genealogies were duly invented, since the foundation theory of the nation was kinship more or less direct with the emperor. This process is transparent on the pages of the Kojiki or Records, composed 712 A. D., and the Nihongi or Chronicles, compiled 720 A. D.

Buddhism, in its first propagation in Japan, not without accompaniments of strife and bloodshed, compelled a still further systematizing of the Way of the Gods, which now received the Chinese name of Shinto, literally theology. Later the Norito, or native liturgies, were rewritten in beautiful literary style. The essence of Shinto, and its one book, is the Kojiki, the so-called "Bible of the Japanese," composed by order, and with the design of correcting false or rival claims to the Mikado's sovereignty. There is no pretence of religious motive, nor of setting forth a moral code; but, following Chinese precedent, Japan must have a cosmology and a national history, and an account of the fashion in which the Imperial house obtained its power. Indeed, one suspects that the many-jointed names of the gods between mud and man are folk etymologies to explain the Ainu place names found by the newcomers on the soil.

It was a dazzling prospect for the Yamato people back in A. D. 552, still many centuries before the white, straight-eyed Aryan-speaking Ainu had been conquered, or even the southwestern Malay and other folk had been pacified, to possess the writing, ethics, and political models of China, and at the same time to have from far, far mystic India the gorgeous images and altar furniture and the sutras, with their world of new ideas. The Mikado's domain was then a mere fragment of land, a little oasis in a vast desert of unsubdued savagery. In less than a hundred years, however, by a palace revolution, the old idea of clan government and the fiction of a bloodtie for all were abandoned. A system of taxation and a strong bureaucracy, with the Mikado shut up like a god, were established. Buddhism was propagated from the court and the throne, bringing in supernaturalism, as opposed to merely natural religion. It was carried in a thoroughly Japanese form to every Ainu hut and frontier village. Whether we call this a chapter of decay, as did the late Professor Whitney, or a true evolution, it strengthens the theory of Okakura that Japan is the epitome of all Asia, the depository of its intellectual forces; and that in Japan is the best treasure-house of Asiatic art and civilization—though Mr. Okakura is weak in his knowledge of the Semitics.

We need not follow Dr. Knox in his chapters on Confucianism, which he discusses first as polity and ethics, and secondly as a world system. The simple tradition of ethics and ritual of North or Communal China having during the centuries absorbed many of the elements of the Hindu faith, and much of the strong individualism of southern China, or Taoism, underwent profound change in the twelfth century. When restated by Chu-Hi it was not only ethics and ritual, but a philosophy and creed. It did not get beyond sea, however, until the seventeenth century, when the Chinese refugees from the incoming Tartar dynasty reached Japan. Then from Yezo it was made official orthodoxy.

Dr. Knox glances at contemporaneous movements. In the glorifying of Busbido, and the works of Okakura and Nitobe, who idealize the past, a Japan is projected on the imagination which never really existed as set forth by these authors. He hints at the efforts of the eclectics to combine with Bushido the noblest truths of our modern science, philosophy, and religion, and at the dreams of those who would find the future of Japan in a return to the worship of the Absolute. He declares that Christianity is a part of the new enlightenment, but it is not for him to believe—knowing the Japanese so well—that they will ever accept that form of Christianity in which the religion of Jesus has been occidentalized beyond all recognition by thinking Orientals. In the possible elements of human interest this book may be lacking, but as a philosophical treatment of a great theme in a spirit at once catholic, critical, and sympathetic, it is a masterpiece.

Émile Zola, Correspondance. I., Lettres de Jeunesse. Paris: Bibliothèque Charpentier.

This first volume of the correspondence of Émile Zola is made up of letters sent to three of the intimate friends of his young manhood, Baille, Cézanne, and Roux. The letters to the last-named, which were written between 1864 and 1872, comprise less than a tenth of the book. They are essentially business documents, dealing almost exclusively with the production at Marseille of a play by Zola and Roux called "Les Mystères de Marseille," and are so devoid of significance of any sort that there is little excuse for their publication. On the other hand, the letters to Baille and Cézanne, which belong to an earlier period (1859-1862), are of much interest.

True, these letters, aside from a few to Cézanne (with whom Zola seems to have felt less constraint than with Baille), are far from being models of the letter-writing art. Taken as a whole, they are perfunctory, ponderous, and pedantic. They are deficient in vivacity. They possess neither grace, brilliancy or distinction of style nor originality of thought. They abound in superlatively solemn advice, in rather amateurish literary criticism, and, in highly formal, not to say stilted, disquisitions on love, marriage, the family, poetry, art, civilization, and religion, which the writer serves up with little or no variation to both his correspondents, and which, by his own admission, he sometimes tries to market as articles in the literary journals. But, with all their commonplace heaviness, they reveal a man so antithetic to the traditional Zola that, for every one who has the slightest curiosity regarding his personality or his art, they are very well worth reading.

In them we find, first, instead of Zola the methodical worker, who blackened a given amount of paper doggedly each day, inspiration or no inspiration, an emotional, vacillating, mercurial Zola, a creature of moods and caprices, subject to spells of discouragement and self-distrust, frequently tearing up in disgust the results of his efforts and sometimes unable to produce at all. Thus we find him saying to Cézanne:

I am prostrated, incapable of writing two words, incapable even of going out for a walk. I think of the future, and I see it so black, so black that I recoil in dismay. No fortune, no trade, nothing but discouragement! No one on whom to lean, no wife, no friend beside me! Everywhere indifference or disdain! This is what greets my eyes when I scan the horizon, this is what renders me so sorrowful. I doubt everything, myself first of all. There are days in which I believe myself without intelligence, in which I ask myself what manner of man I am to have dreamed such proud dreams. I have not finished my studies, I do not even know how to speak good French; I am ignorant of everything. My college education is of no service to me; a little theory, no practice. What to

do then? My mind is continually balancing, and I am sad from morning till night.

Next, instead of Zola, the novelist, we find Zola, the poet, producer of lyrics and projector of vast epics, an admirer of form, a worshipper of beauty, who brings everything in life and letters to the touchstone of poetic standards. He proclaims the loftiness of the poet's calling in another letter to Cézanne:

Baille, you say to me further, regards art as a sacrament: this is thinking as a poet should. Yes, art is a cult, the cult of the good, of the beautiful, of God himself. Under the verses is the soul, like the visage under the mask. Alexandrine, hemistich, and rhyme are the materials, the tools which every hand may use; but, soaring above these coarse means, is the Idea, fructified by the heart; the Idea, this celestial gift, this imprint of the finger of God. Furthermore, as you add, every one is not admitted to the adoration of the Idol; as for me, I should have perhaps said, of God, for poetry and divinity are synonymous in my sight. After having placed the poet so high, I shall not dare to say to you that I am a poet; but, in all sincerity, I may advance that I am striving to be one, and that I comprehend the sublimity towards which I strain—and this is more than can be said of the herd which sees in a poet only a machine for the production of cesuras and rhymes.

Finally, instead of Zola, the realist, we find an idealistic Zola; indifferent to science; glorifier of virtuous, and even of Platonic, love; "a nursling of illusions"; an admirer of such romanticists as Ary Scheffer, George Sand, Lamartine, de Musset, and Michelet; a dreamer, whose sole ambition is a peaceful retreat remote from the hurly-burly of the world; a lavish dispenser of lofty, unworldly counsel to his friends. The future chief of the realistic school writes to Baille:

You speak to me justly of the ideal and of reality, and you propose to me that we reopen our ancient discussion upon this subject, but with a change of positions, you becoming the idealist and I the realist Such an idea cannot appeal to me; I wrote in conformity with my views, and, after a thorough self-examination, I find no change in my thought. I should be untrue to myself if I addressed to you at this time the letters you addressed to me formerly. I cannot become a realist in the sense you give this word, since to erect material necessities into law would be to stifle all the noble impulses of my nature. But, as I did not cease to repeat to you, I have often encountered reality; I know it, and, if you desire, I can show it to you, so that I be allowed to speak to you afterwards of the sky and to discover to you a star in every stagnant pool I shall have sounded. What irritated me profoundly before was your persistent unwillingness to comprehend my philosophy. In vain I cried to you: "Reality is sad, reality is hideous; let us veil it then with flowers; let us have no more commerce with it than our miserable humanity demands; let us eat, let us drink, let us satisfy all our brutal appetites, but let the soul have its part; let dreams embellish our hours of leisure."

To read these letters is to comprehend the career of Zola in its entirety. The Zola who appears in them is the poetic, self-deceived altruist of "Les Trois Villes" and "Les Quatre Évangiles," and the Don Quixote of the Dreyfus affair. Toward the end of his life Zola returned to himself. We see the romantic strain of unreality that underlay and distorted his so-called realism. The one thing furthest from his vision always was the simple uncolored apprehension of the truth.

The Historic Thames. By Hilaire Belloc. With colored illustrations by A. R. Quinton. New York: E. P. Dutton & Co. $6 net.

This is not one, but two distinct books. We have in the first place a series of colored reproductions of scenes and buildings along the Thames River from its headwaters to the Tower, which may be said to hold a respectable place among illustrations of this kind so greedily devoured by the public. As in most books of the sort, the colors are too heavy—the reds too red, the blues too blue—with a somewhat messy effect. But with these deductions the sites with which every one is familiar, by name at least, pass before the eye with all their romantic charm. They offer a lazy man's voyage as well as can be expected.

Besides the pictures there is, secondly, Mr. Belloc's text, of which it must be said that it bears the least possible relation to the illustrations. Glancing at the views of houseboats moored at Oxford, of Hampton Court Palace, Eaton, Sunset at Marlow, Medmenham Abbey, Henley, Bray Village, and the like, one looks to the text for a graphic description of the river seasoned with its historical and literary traditions. Quite the contrary is the fact. These scenes are scarcely mentioned in the narrative. What we have is an interesting monograph on the place of rivers, particularly of the Thames, in the formation of early society, with a rather savage diatribe on the change in English civilization brought about by Henry the Eighth's dissolution of the abbeys, and by the consequent rise of the landed aristocracy. The Thames, in other words, is made the excuse for a shrewd discussion of government and sociology. There is, of course, no harm in thus binding together pictures and text so little related, except that in a smaller volume Mr. Belloc's monograph might be read with greater comfort, and that the pictures would gain in interest for some account of their associations.

The substance of Mr. Belloc's discourse is an arraignment of the popular, protestant, and, as we may say, Teutonizing historians, such as Green and Freeman; and here, we think, his case would have been stronger if he had omitted his constant flings against the omissions and imbecilities of the conventional students of history and economics. His aim is to show how much England has suffered from the break in its continuity of traditions, how much happier and, relatively, how much more prosperous the poorer classes were under the rule of the Church than under the "Venetian oligarchy," as Disraeli called it, or under the present commercial régime. To do this he displays at considerable length and with no little skill the economic function of the monastic system in the Middle Ages, "to which," he adds unnecessarily, "no sufficient attention has been given by historians." As a part of his argument he gives a picturesque account of the rise of the Cromwell family. Thomas is a "witty scoundrel," and the enormities of Oliver Cromwell (*alias* Williams, as he repeats with rather impertinent frequency) are left to be conjectured by the imagination. In much of his argument he follows what is, on the whole, the trend of the most modern school, which deprecates the violent changes of the Reformation and the Rebellion, and shows the great loss to England's higher civilization caused by a few hot and foolish heads of the seventeenth century. But it is also true that Mr. Belloc carries his partisanship beyond all bounds. Thus, he says, to take his attitude toward the Dissolution:

In a word, the business of Henry might be compared to what may be in future the business of some democratic European government when it lays hands upon the fortunes of the great financial houses, but with this double difference, that the confiscation to which Henry bent himself was a confiscation of capital whose product did not leave the country, and could not be used for anti-national purposes, as also that it was the confiscation of wealth which never acted secretly and which had no interest, as have our chief money lenders, in political corruption.

Every one of these statements might be controverted, and to ignore the corruption of the monastic system in Henry's day is simply not to write history. When Mr. Belloc touches on "moneylenders," he shows all the spiteful venom of a French anti-Dreyfusard. Naturally his book will call down reprobation from certain high quarters, but it can not by any one be denied the qualities of interest and vivacity.

Christianity and the Social Crisis. By Walter Rauschenbusch. New York: The Macmillan Co. $1.75 net.

The radical tinge of the title of this book is not belied by its contents. The thesis of the author is that the ruling purpose of Christianity is social reconstruction, that for various reasons this prime object of the Christian religion has been grievously neglected from the apostolic age to the present, that the Church is now face to face with a grave situation, and that her duty as well as her opportunity is to turn Socialist, abjure the present competitive system, ally herself with the proletariat and against the capitalistic class, and march on in triumph in a new order of the world. Such a manifesto from a professor of church history in a leading theological institution is highly significant. It may be taken to indicate that the leaven of revolutionary social theory is pervading religious circles more generally than has been supposed.

Professor Rauschenbusch writes in the heat of religious zeal and with reforming passion. The "comrades" of socialistic groups will find here the nervous intensity and fire to which they are accustomed. The enthusiasm of the street-corner orator, however, has played havoc with the author's judgment as an historian. The primary conviction on which he has based his argument is that Christianity came into the world as a social movement, and that the real aim of its founder and his immediate successors was the reconstruction of society. The attempt is made to draw a close parallel between the political activities of the Hebrew prophets and the career of Jesus. Yet, if any conclusion is established as the result of critical study of the gospels, it is that the reformation of society was far from the thought of the Galilean teacher, and that anything like a panacea for the ills of the world is in direct violation of his spirit. His message was for the inner life of the individual and he did nothing for society as a whole. That he did not contemplate the abolition of

poverty is shown by his remark, "The poor ye have always with you," and the equanimity with which he regarded oppression and inequality is witnessed by his counsel, "Render unto Cæsar the things that are Cæsar's." The socialist interpretation of the New Testament is further from the truth than the traditional and ecclesiastical.

In justice to Professor Rauschenbusch his remarks that "Jesus was no mere social reformer," and that "no comprehension of Jesus is even approximately true which fails to understand that the heart of his heart was religion," should be quoted. As a teacher of history he is well aware that the apocalyptic atmosphere in which the founder of Christianity lived permeated all his thought. But the judgment of the historian gives way completely before the passion of the reformer.

More serious is the evidence of a clouding of moral vision through the influence of socialistic theory. Appeal is made for an alliance of the spirit with the flesh, and failure is predicted unless faith reach out for carnal weapons. Only so can we understand the following declaration, with which the author declares he "started out":

> The ideal of a fraternal organization of society will remain powerless if it is supported by idealists only; it needs the firm support of a solid class whose economic future is staked on the success of that ideal.

It may be remembered that there have been apostles who gloried in other gospels than that of self-interest. It would appear also that faith, having formed a new alliance, must not insist too strenuously on its former gentle methods of spiritual persuasiveness: for we are told that "the Christian idealists must not make the mistake of trying to hold the working class down to the use of moral suasion only, or be repelled when they hear the brute note of selfishness and anger."

Professor Rauschenbusch insists on the wrongfulness of the "wages system," and waxes indignant over the fact that an individual or corporation can hold title to a vein of coal or copper! In the orthodox socialistic manner he "proposes to give to the whole body of workers the ownership of these vast instruments of production and to distribute among them all the entire proceeds of their common labor." He is amazed at the "resistless and elemental power" which Socialism has exhibited, is persuaded that it is the "ultimate and logical outcome of the labor movement," and that the Church, therefore, should ally herself speedily with Socialism as the coming power. From the author's statement, however, it would appear that Socialism is purely an economic movement, which proposes to bring about the brotherhood of man by economic methods. If this be true, what fellowship can it have with the spiritual idealism of the New Testament?

Cromwell. Von Wolfgang Michael, Professor an der Universität Freiburg i. Breisgau. Mit drei Abbildungen. Zwei Bände. Berlin: Ernst Hofman & Co. (Bände 50 u. 51 der Biographien-Sammlung Geisteshelden.)

The German "Heroes" series, which now numbers fifty-three volumes, contains the biographies of forty men of prominence, of whom eight, Carlyle, Darwin, Shakespeare, Tennyson, Stanley, Byron, Adam Smith, and Cromwell, are Englishmen, and the remainder, with a few exceptions, Germans of the last two centuries. No American appears in the list. Of the forty thus far selected for the German hall of fame, but seven are men of action in the sense of warriors and political leaders. The others are "heroes" in the world of thought and culture—poets, scientists, dramatists, philosophers, artists, and musicians. This fact serves to show that, however much militarism has dominated the German system of government and administration, and has planted its Hohenzollern heroes in marble along the Unter den Linden, the German idea of a "hero" is still intellectual and artistic.

Cromwell appeals to the German mind because he resembles, in a more or less fanciful way, the founder of the modern German empire. Like Bismarck, he was a man of heroic stature who performed Titanic deeds. He swept away the old and established a new order; he remodelled armies and won great military victories; he overthrew established kingdoms and founded a new government; he manipulated parliaments, and as a statesman experimented in constitutional forms. Like Bismarck, he was humble before God, deeming men weak and unworthy, and himself but an instrument in the hands of the Most High. Both viewed history as a series of divine manifestations beyond the power of statesmen to control. Cromwell might well have said, as did Bismarck, that the statesman cannot make history, but that "he must wait until he hears the footstep of God sounding through the events of his time, and then springing forward grasp the hem of His garment. That is all." He, like Bismarck, spurned the tricks of the orator. "I cannot," he once said, "work upon your feelings through a play of words and so obscure the facts. The orator coins mere words; my duty is to deal with facts, and the decrees of God demand that of us." He often said that he spoke best when he drew upon the ideas which God had implanted in his soul.

Professor Michael's biography bears many resemblances to that of Professor Firth in the Heroes of the Nations series. It is commonly accurate and scholarly, free from digressions and philosophical disquisitions, and is at all times cautious and impartial. It is rather longer than is Professor Firth's work, and touches more aspects of Cromwell's character. On the whole, it is more readable, because less condensed, and more complete, because presenting a better-proportioned picture of Cromwell's life and activity. It contains a few errors—for example, when Hugh Peters is mentioned as one of the founders of Connecticut—and in general is not very satisfactory in what it says of Puritanism in England and America. It is, furthermore, deficient in all that relates to Cromwell's colonial and commercial policy, for, though it deals successfully with the navigation act of 1651, and has a few paragraphs on Continental trade, it says nothing of the machinery for controlling trade under the Commonwealth and Protectorate, and ignores the greater part of the legislation of the period. On the other hand, it is strong on the military and diplomatic sides, has excellent chapters on the wars with Holland and Spain, and gives rather more space than is usual to the relations with the Northern Crowns. It possesses, too, a critical bibliography of unusual excellence, and has a fairly good index.

The narrative is based very largely on the writings of Gardiner and Firth, but Professor Michael is familiar with a wide range of Cromwellian literature, including the writings of a number of American scholars —Beer, Merriman, Bowman, and Catterall. Strong's articles have, however, escaped him. He has dealt to a small extent with manuscript sources in London and Sweden, and has used, for the first time in this connection, the dispatches of Schlezer, the Brandenburg envoy in London, found in the secret Archives of State in Berlin. Schlezer's letters throw considerable light on Cromwell's later career, 1657—1658, and on Richard Cromwell as Protector. Professor Michael promises to show at some future time wherein these papers add to our knowledge of Cromwell's rejection of the kingly title, and of his sickness and death.

The portrait which forms the frontispiece to the first volume, and that which faces page 128 of the same volume, are new and have never been reproduced before. They are from photographs of two paintings now in the Gripsolm palace, in Stockholm, and in posture, dress, and features, bear a striking resemblance to the well-known portrait by Walker.. Indeed, there is reason to think that Walker himself painted the first portrait, which may have been sent by Cromwell as a gift to Queen Christina of Sweden. Regarding the second, nothing definite seems to be known, though tradition says that it was painted by Sir Peter Lely. It is strange that Gardiner, in the collection of likenesses gathered for the Goupil edition of his life of Cromwell, should either have neglected or been ignorant of these paintings.

Cambridge. By M. A. R. Tuker. Illustrated by William Matthison. New York: The Macmillan Company.

Trinity College, Cambridge. By W. W. Rouse Ball. Illustrated by Edmund H. New. New York: E. P. Dutton & Co.

St. John's College, Cambridge. By R. F. Scott. Illustrated by Edmund H. New. New York: E. P. Dutton & Co.

The English universities have been much exploited by publishers of recent years, partly for the benefit of old Oxonians and Cantabs, partly for that of a larger public. Of the three books now under review the first is addressed to the wider circle, the last two aiming more closely at past members of the two greatest Cambridge colleges. It must be said, however, that Mr. Rouse Ball's little book on Trinity contains many anecdotes concerning its worthies that are well worth reading, even for those who are not members of the college, as for instance Porson's subtly expressed criticism of Southey: "Mr. Southey is indeed a wonderful writer; his works will be read when Homer and Virgil are forgotten." Or this one of his successor in the Mastership, Mansel:

> It is said that one of the undergraduates invariably walked across the grass on his

way to Hall. One day the Master determined to reprove the delinquent, and, opening the window at which he was sitting, he called to the student: Sir, I never look out of my window but I see you walking across the grass plot. My Lord, replied the student, I never walk across the grass plot but I see you looking out of the window.

M. A. R. Tuker's volume contains nearly a hundred colored illustrations, as to the excellence of which tastes will doubtless differ. The text, however, may be commended as an intelligent and careful exposition of the mysteries of an English university, sound, discriminating, and readable. In it the author covers the historic growth of Cambridge, the colleges, the university as a degree-giving body in the past and present, collegiate and social life, famous men, Cambridge in English history, and the women's colleges Newnham and Girton.

From all of these books there may be disengaged something not without value to the American of the present day. At Cambridge, on the other side, time is of the essence of the intellectual contract. It is not a gain but a loss to get, say, Aristotle in six months instead of in six years. You may acquire facts by cramming, you can acquire intellectual maturity only by a process of slow and continuous absorption. The university is concerned primarily with the cultivation of the mind and the advancement of learning; it is incidentally, almost apologetically, that she admits that these processes may lead to the practical result of earning income. The man in a hurry who does not care to digest his intellectual pabulum, but is merely concerned in converting it into practical results, gets, fortunately, little more encouragement in the Cambridge of the present than he did in the Cambridge of the past. Have we any institution left of which this can truly be said?

Science.

Nearest the Pole. A Narrative of the Polar Expedition of the Peary Arctic Club in the S. S. Roosevelt, 1905-1906. By R. E. Peary, U. S. N. With ninety-five photographs by the author, two maps, and a frontispiece in color by Albert Operti. New York: Doubleday, Page & Co. $4.80 net.

The one abiding impression left by Commander Peary's graphic narrative is his devotion to the work to which he has given the greater part of twenty years. From beginning to end it shows that he was animated by that spirit of the true explorer who, to use his own words on receiving the Hubbard medal of the National Geographic Society, unflinchingly holds that "the thing he has set himself to do is a part of his being, and must be accomplished for the sake of the accomplishment." So when he reaches his farthest point his feeling is not that of exultation at "the mere beating of the record," but of bitter disappointment that he must turn his back upon the goal, to attain which "I had almost literally been straining my life out." He makes his readers feel that the desolate Arctic land is more congenial to him than the congested thoroughfares of civilization. Going on shore one day early in his outward voyage, he says, "as I trod the moss patches beside the murmuring stream whose quieter reaches were crusted with ice, . . . my pulses bounded rapidly and I felt that I had come into my own again." Characteristic, too, of this same spirit, is the way in which the new land discovered in his exploration of the Grant Land coast is regarded. "What I saw before me in all its splendid, sunlit savageness was *mine*, mine by the right of discovery, to be credited to me, and associated with my name, generations after I have ceased to be."

As Commander Peary states in his preface that the preparations for his new expedition had rendered it impossible for him to put his narrative into the shape which he desired, criticism of it from a literary point of view would be out of place. It consists largely of extracts from his diary, and they give vivid pictures of the hardships and dangers of an Arctic explorer's life. Naturally they are characterized by a similarity, and he had no thrilling experiences to relate. But the reader gets a clear idea of the way in which emergencies were met, dangers from ice-pressure guarded against, provisions obtained and exploration carried on. Occasionally there are touches of humor, as for instance: "We crossed the Arctic Circle at two o'clock this morning, and Percy, the steward, asserts that the bump when the ship went over it, woke him up!!" Once when the Roosevelt was fighting her way through the ice-floes, he heard the captain "whisper through teeth clinched from the purely physical tension of the throbbing ship under us: 'Give it to 'em, Teddy, give it to 'em!' " In this connection it is interesting to note the satisfaction which this ship gave. She forced her way through apparently impassable places and came "safely through experiences which I am satisfied no other ship afloat would have survived." In one of her charges a blue floe, twelve to fifteen feet in thickness, was split fairly in two. He was fortunate also in the choice of his companions.

I have never spent a winter in the Arctic regions, so free from petty annoyances and discomforts, both physical and mental. The members of the party were congenial, cheerful, energetic, and interested in the work. The ship's people were interested and willing, and the atmosphere of the ship lacked entirely the element of friction which is so often an extremely disagreeable feature of Arctic winter life.

The most striking result of the expedition was, of course, his getting nearer to the Pole than any other explorer, reaching 87° 6′ north latitude on April 21, 1906. But for the loss of seven fair days in crossing the open water of the tidal crack between the land ice of Lincoln Sea and the central polar pack, he might have conquered the 174 nautical miles which lay between him and his goal. The exhaustion of his food, the death of his dogs, and the panicky condition of his companions, however, rendered further advance impossible. The experiences of this record journey across the ice lead him to the conviction "that man and the Eskimo dog are the only two mechanisms capable of meeting all the various contingencies of serious Arctic work, and that the American route to the Pole and the methods and equipment used remain the most practicable for attaining that object."

The other main results were the discovery of some new land, probably an island, in the northwest, the addition to our knowledge as regards ice and other conditions in the western half of the central Polar Sea, the delineation of a large part of the unknown coast of Grant Land, and the determination of its unique glacial fringe and floeberg nursery. A chapter is devoted to a report to the Peary Arctic Club (of whose history from its foundation, in 1899, a brief account is given) of work done by him in the Arctic in 1898-1902. In another there is a detailed description of the Roosevelt, in which stress is laid on the fallacy of the notion that steel is a suitable material for the construction of an Arctic ship, and on the fact that "the elasticity, toughness, and resiliency of thick wooden sides are essential" in it. Some entertaining sketches and impressions of "my Eskimos," which are on the whole distinctly favorable, are given in the last chapter. His narrative ends with this characteristic answer to the question often asked him: Of what use are Eskimos to the world? "With *their* help, the world shall discover the Pole." The attraction of this sumptuous volume, whose typographical excellence and general make-up reflect great credit on the publishers, is much heightened by the numerous photographs of scenery, human beings, and animals. Among the most noteworthy, after the portraits, are those of a typical dog and "a study in bronze," the face of an Eskimo woman.

A German physician, Dr. Robert Hessen, has recently published the results of his researches concerning the real cause of consumption ("Die wahre Ursache der Schwindsucht"), which he ascribes to the checking of the purifying function of the pores of the skin. In support of this theory he records some interesting facts. Fresh air and out-of-door exercise are important factors in the prevention of this disease. For this reason in England 1,500 persons in a million die of consumption, whereas in Germany there are 2,000, and among the Russian peasants 3,500. The latter pass the winter wrapped in sheepskins near a warm fire, and rarely if ever wash their bodies. Dr. Hessen further says that young women, who are employed in stores to show furs and walk to and fro all day in these warm garments, usually suffer from phthisis. This was also the fate of the English comedians, who some years ago masked themselves in hides in order to represent animals on the stage. Although these plays were very popular, the mortality of the actors from pulmonary disease soon put a stop to them. Dr. Daniel Diehl, the chief physician of the Hamburg-American Steamship Company, states in his books of travels "An Bord und im Sattel" that Patagonians and other tribes who go naked are never consumptive; and the Norwegian zoölogist and Arctic explorer, Fridtjof Nansen, in his volume "In Night and Ice," asserts the same of the Eskimos, who always go naked in their huts. Only in western Greenland, where the natives have been converted to Christianity

and persuaded by the missionaries to wear clothes, does pulmonary disease prevail.

Drama and Music.

"A Question of Honor," by Max Nordau, translated by Mary J. Safford (John W. Luce & Co.), was first published under the title of "Dr. Kohn," in 1898, although no intimation of that fact is given in the present volume. It may be a revised edition—though nothing is said on that point—but in any case, the description on the flyleaf, "a tragedy of the present day," without allusion to the original date, is misleading. Moreover, there is nothing in the printed text, even in the stage directions, to denote the place of action, which, to say the least, indicates strange carelessness in preparation, although the omission will not be of much consequence to the intelligent reader, who will be sufficiently informed by the circumstances of the story. During the last ten years liberal ideas have made some headway even in Prussia, and the social and political condition of the Jew has been improved, although still subject to many galling restrictions. Dr. Nordau wrote at a time when the Anti-Semitic prejudice was raging in Germany with peculiar violence, and he pictured an extreme case. But if his play, like most bits of special pleading, is somewhat extravagant in its illustrations of moral and intellectual virtue on the one side and gross bigotry on the other, it deals fairly and forcibly with the general question, and demonstrates in vivid fashion the follies and crimes of racial and religious hatreds. Incidentally it satirizes with pungent vigor various absurdities of the German military code of honor, and the atrocious illiberality of a certain brand of ecclesiastics. Politically it is a strong appeal to the Jews to reassert their nationality. The warning that the stage rights are reserved seems rather superfluous. It is not at all likely that any manager here would dream of producing anything at once so undramatic and contentious. But as a study of one of the problems in European politics it is both illuminating and interesting.

J. Comyns Carr is the latest dramatist to attempt a solution of "The Mystery of Edwin Drood." He has made a play out of the unfinished Dickens story, in which Beerbohm Tree is soon to be seen at His Majesty's Theatre in London, in the character of John Jasper. It is hinted that Mr. Carr has invented a dénouement different from any of those which have been hitherto suggested. The question is not one of much importance. It would be quite in accordance with theatrical custom if he brought Drood back to life again for the sake of the conventional happy ending. The character of Jasper seems to be well within the range of Mr. Tree's best abilities, and ought to afford him a good opportunity.

During her provincial tour in England next autumn, Mrs. Patrick Campbell will produce an English version of Hofmansthal's "Electra," which has had a long run in Berlin and great success throughout Germany. The adaptation will be done by Arthur Symons, and the music is to be composed by Cyril Scott. In Berlin the piece provoked much controversy, some critics protesting against its very modern treatment of the ancient classic. Hofmansthal made his first success with "Gestern," a play in blank verse written at the age of sixteen. "Œdipus" and "The Sphinx," his most recent productions, have both won public favor.

It is announced that Madame Modjeska is contemplating a brief professional season in some of the larger cities next winter.

Leoncavallo's new opera, "The Red Blouse," is based on an episode of the period when Austria ruled Venice. Two brothers, one of whom is in sympathy with Austria, while the other is an ardent Venetian patriot, are infatuated with the same girl. She loves the patriot and makes no secret of her preference. Vowing vengeance, the rejected lover denounces his brother to the police as a Garibaldian. His immediate arrest follows. The girl, expecting his prompt execution, and guessing his brother's crime, sends for the latter and promises to be his if he can secure the release of the prisoner. The brother eagerly agrees to testify in his favor. The day of the trial comes. A gunshot is to tell her that he is sentenced to death, while a trumpet signal will indicate his acquittal. The brother, having given his testimony and feeling sure of the other's acquittal, hastens to the girl to claim her as his own. As he enters a shot is heard. With a wild cry the girl draws a dagger and stabs him. The shot, however, proves to have been accidental. While the girl abandons herself to her grief, friends arrive and announce that her lover is free. Curtain.

Japan has taken up European music seriously. Kobe has a Chopin Club, which gave a concert on May 3. A large portrait was displayed over the stage, and the walls on all sides were decorated with biographical facts concerning the composer. In Tokio, on April 30, S. Saito, the well-known organist, gave a recital of Bach's works. Tokio has an Academy of the Piano, the faculty of which consists of "more than twenty Japanese pianists of prominence."

Art.

An important work has just been published by the Grolier Club—Dr. D. McN. Stauffer's "American Engravers upon Copper and Steel," issued in two handsome octavo volumes, printed at the De Vinne Press, and containing forty-three full-page reproductions, of which twenty-three are photogravures. Three hundred and fifty-three copies have been printed, three being on Japan paper. One of these three is as usual for the Club library; the other two will be offered at auction to the members at the next annual meeting.

Dr. Stauffer's work really opens up a new field, and is the first attempt to record systematically the professional lives of about 706 American engravers. These biographical sketches, which in a large number of cases are entirely new material not accessible elsewhere, fill the first volume. The second volume contains full descriptions of about 3,500 engravings and their "states," executed by men who were actively employed in or prior to the year 1825. This date was selected as marking about the beginning of what may be termed the commercial era of engraving, when large companies were organized and the actual engraver's name no longer appeared upon the plate. The number of plates issued during those prosperous years from 1825 to the introduction of the photo-processes was enormous, one concern having issued more than 25,000 separate plates.

Except in the case of the very earliest engravers whose minor work even is important, not every plate is described, but generally only portraits, buildings, historical views, and some large and important plates. Ordinary book-illustrations, not falling under these heads, have been for the most part excluded. Plates of this "subject" type were often used again and again for different books by various publications, the lettering being altered, as required, until they were worn out.

The descriptions of the prints are accurate, done, with a few exceptions, from the engravings themselves, and include lined transcripts of the legends. The arrangement is alphabetical by the name of the engraver, and under the engraver alphabetically by subject as to the portraits, the views and miscellaneous prints being put at the end. We may here point out an oversight in the make-up of the book which will serve to exasperate many a user of the volume. The headlines are uniform throughout, and the engraver's name is not carried over from page to page. If it is desired to consult any particular engraver, the book is likely to open in the middle of the description of the work of some prolific artist, and it may be necessary to turn backward or forward several pages before one can determine the location of the author. Uniform headlines are, in a book of reference, a waste of space which might be better occupied. Collectors who have had occasion to use Foley's "American Authors" will appreciate our criticism.

In a lecture delivered before the members of the British Academy on the "Column of Trajan," Commendatore Boni, director of excavations in the Roman Forum, gave an interesting account of his latest researches on that subject. Until recently it was commonly believed by archæologists that Trajan's column had been erected to indicate the height of a hill cut away in order to level the area for the Forum Ulpium, the dedicatory inscription (*ad declarandum quantæ altitudinis mons et locus tantis operibus sit egestus*) having been interpreted to convey that meaning. This view, however, did not seem to Commendatore Boni to be in accord with the few statements of ancient writers on the subject, where the column is referred to as a sepulchre, and he therefore determined to investigate the matter. He soon found that in the inner vestibule at the base of the column there were still visible traces of a door which had been walled up and plastered over. On removal of the plaster and part of the masonry, it was found that the door led into an atrium, which, in its turn, led into a chamber, within which were the remains of a funeral table; moreover, just above the table, holes had been

drilled in the marble wall of the chamber, presumably for clamps to support two urns. On the evidence of an inscription, now in the Vatican Lapidarium, stating that Hadrian had erected a temple in honor of his parents Trajan and Plotina, which temple had stood close to the column, Boni ingeniously inferred that the chamber which he had discovered was a sepulchral chamber, and that the funeral table had supported two urns containing the ashes of Trajan and his wife. On making careful trigonometrical calculations, it was furthermore found that the column was a "columna centenaria," exactly 100 feet high; it is at least improbable that a hill should have been exactly this height. What proved Commendatore Boni's contention beyond dispute was the fact that, on digging various pits in the vicinity of the column and also across the whole width of the valley occupied by the Forum Ulpium, remains of early imperial and republican work, such as roads, foundations, drains, were laid bare. At one spot were even found traces of a wall of blocks of tufa, which we know, from similar remains elsewhere, probably date from the 4th century B. C. This shows that, long before the column was built, the valley between the Quirinal and the Capitol had been practically a level plain and not a hill. The dedicatory inscription, which has hitherto been used as evidence for the existence of such a hill, Boni now interprets as referring to the height and noble proportions of the buildings which had been erected both on the level of the Forum Ulpium and on the slope of the neighboring hill, and of which a view could be had from the top of the column.

An alphabetical and fully illustrated catalogue of all the French drawings in the Louvre and the Museum of Versailles is an enterprise that cannot fail to win the interest of students. This enormous task has been undertaken by Jean Guiffrey and Pierre Mond, and the work bears the imprint of the Librairie Centrale d'Art et d'Architecture, Paris. In the first volume the roll is carried from Adam to Bouchardon. The list is printed clearly in double columns, there are tables of watermarks, collectors' stamps and those of museums, finally an index of proper names. One can hardly imagine a better arranged or more prepossessing piece of scientific classification. One may regret that so many cuts, excellent photogravures, have been crowded upon each plate. The editors have evidently destined the reproductions rather for the purpose of identification than for study. A few cuts, however, take advantage of the generous quarto page. The most welcome of these in the present volume is the Assumption in sepia, ascribed to that consummate miniaturist of the fourteenth century, Beauneveu. Each volume costs thirty-five francs, and the series will apparently run into the twenties, requiring perhaps as many years for its completion. The descriptive but cumbrous title is "Inventaire général des dessins du Musée du Louvre et du Musée de Versailles." The work forms part of the collection Archives des Musées Nationaux et de l'École du Louvre.

Charles Morice, the well-known Paris critic, has made a valuable contribution to the history of modern painting in his study, "Eugène Carrière" (Paris: Société du Mercure de France). This little volume is made up largely of the writings and sayings of Carrière, who was the author's friend. It is an exposition, not a criticism. Since Carrière was not merely a creator of theories concerning the painter's art, but also had the much rarer gift of working according to programme, and actually prevailing thereby, this intimate revelation of his mind is of no common interest. He believed firmly in that principle of correspondences which he shared with Rodin and many of the Symbolists. The business of art, he felt, was to discern and assert the intimate relations between man and man, between the animate and inanimate creation—relations obscured if not denied by the average careless liver. The beauty of an object for him lay not in its abstract form or color, but in its suggestion of kinship with countless similar objects. What saved this attempt from being merely intellectual and frigid, was that it was based after all on vision primarily, and not on reflection. He saw his sitters, almost invariably his family and friends, in a sort of aura—the famous mist that invests his figures. This envelope dissimulated all narrowly individual traits so that every composition or portrait became a type. Carrière's strong sense of bony and muscular form prevents, however, any loss of character through such simplification. In fact one may say that in becoming generalized types his figures actually gain a higher degree of reality. We have no space to follow his theory in detail or to quote from his many admirable *pensées*. It is a book that should be read entire. We can take exception to M. Morice's frankly adoring attitude only when it leads him to claim for Carrière the greatest gifts as a colorist and decorator. Finally it is suggestive to note so important an achievement made in sheer repudiation of the still popular doctrine of art for art. Carrière's attempt to understand himself and his fellows through the exercise of universal sympathy is the very negation of the ideal of the "ivory tower." His positive fraternalism associates him in some measure with the modern Socialistic movement, with which, however, he had no closer affiliation.

Finance.

Regulation of Commerce Under the Federal Constitution. By Thomas H. Calvert. Northport, N. Y.: Edward Thompson Co.

The conflict of State and Federal jurisdiction so long associated with the question of slavery has taken on a new form during the last quarter-century with the development of industry and the enlargement of the scope of business activity in corporate form. Federal versus State regulation has become a distinctly practical question to the directors of many a large corporation. The extension of Federal interference in various directions and the numerous suggestions for still greater enlargement of the range of Federal activity have turned the inquiring attention of the whole nation to the source and extent of Congressional power over industrial action.

A number of books have appeared within a few years treating in more or less detail the history and judicial interpretation of the interstate commerce clause, the best of them being the recent work by Prentice and Egan. The volume under review is another of the same kind. It is intended primarily as a lawyer's handbook, and it will doubtless serve its purpose successfully, for the arrangement is logical, the cases well chosen, and the significant points in decisions clearly formulated. The book lacks attractiveness for the general reader in the fact that it contains little else than cases—almost no comment, explanation, or summary. Neither does it possess sufficient originality to enable it to usurp the place occupied by its predecessors.

However, the author has occasionally expressed an opinion on a controverted question not yet adjudicated that reveals his fundamental philosophy. From the parallel that a State has power to regulate rates for domestic transportation, he draws the conclusion that Congress has the power directly to prescribe interstate rates within due Constitutional limits.

Financial.

Convertible Bonds

In the third edition of our 6-page circular, entitled "Convertible Bonds," we describe practically all of such investments now upon the market. In addition, we explain why such bonds, when properly selected, are well regarded by conservative investors, and also why they possess every probability of returning exceptionally large profits.

Properly selected investments are based upon safety and income yield combined; in other words, minimum risk of principal and maximum income return.

BROWN BROTHERS & CO.

No. 59 Wall Street, New York

He recognizes the existence of a Federal police power similar to that exercised by the States in domestic matters, and believes that the power of Congress to regulate under the interstate commerce clause may be extended to the point of prohibition. But he doubts whether Congress has the absolute and unlimited power to prohibit the transportation of articles respecting the use of which no question of public health, public morals, public safety, or public convenience can arise. For example, while recognizing the wisdom and constitutionality of the pure-food laws, he considers the prohibition in interstate commerce of goods produced by child labor as beyond the power of Congress, and holds it to be a matter of domestic concern entirely within the control of the individual States. We may hope that in this respect he has interpreted our Constitutional law correctly, and that the courts will promptly dispose of the dangerous and pernicious proposition advocated by Senator Beveridge at the last session of Congress, if it is ever enacted into law. Referring to the Wilson act of 1890, which subjects to the operation of State laws intoxicating liquors when transported into any State, the author urges the wisdom of taking one step further in the direction of national and State comity by withdrawing the privilege of importing into a State even for personal use articles in which the laws of the State prohibit traffic—a suggestion which, if adopted, might, in view of the extraordinary character of much of our recent State legislation, work a distinct hardship to the beneficiaries of interstate traffic. Moreover, there is considerable doubt whether the courts would sustain a statute of such sweeping character and of such broad application.

The author's study has impressed him with the wide powers possessed by the States over the instrumentalities of commerce, even in matters affecting their interstate business, and has led him to the same conclusion reached by Secretary Root in his oft-quoted speech, that it is the indifference and the delinquency of the States in adopting adequate regulations that have led to agitation for Federal regulation. "There would be no need to invoke the exercise of the Federal power in such cases if States adopted reasonable regulations to satisfy local requirements or opinions."

ALICE-FOR-SHORT

By WM. DeMORGAN, author of "JOSEPH VANCE" ($1.75)

The Nation says: "This is Dickens, that is Thackeray, yonder is a hint of the Du Maurier stepping-stone . . . there is no manner of doubt as to the school to which this new-old craftsman belongs; the important fact is that he belongs to it, and does not merely hang upon its heels. 'Alice-for-Short' is sure to retain for its author the friends which 'Joseph Vance' made for him."

The Nation.

NEW YORK, THURSDAY, JULY 18, 1907.

The Week.

Right on top of the announcement that those who are trying to pick a Presidential dark horse had better keep their eyes on Secretary Cortelyou, comes that official's announcement of his proposed reform of the methods of handling passengers' luggage on steamers and docks. Some time ago it was stated that Mr. Cortelyou would endeavor to abolish the existing habit of outraging American citizens who have dared to expend from $10 upward during their sojourn in Europe. The chief result of his study of the manners and methods of his subordinates is his doing away with the requirement that a passenger be made first to swear to his declaration, and then be examined with a view to proving him a liar. No oath will be required of the criminal American tourist hereafter, nor will he be forced to spend the last two hours of his voyage sitting in line in the steamer's saloon waiting his turn to be cross-examined. He can sign his declaration at any time on the way over. The examiners in the past have evidently believed that every one of their victims was at heart a smuggler. In this they were often right; the existing barbarities would make an apostolic delegate hide his pearl shirt-studs in his shoes and the most respectable Methodist bishop alive conceal his new London clothes at the bottom of his trunk, while the most saint-like of women would smuggle with all the ardor, not of a law-breaker, but of an outraged soul. The whole miserable, picayune, personal baggage law ought to go. In the hope that it will, travellers to Europe will henceforth gratefully wear a Cortelyou Presidential button in the lapels of their coats.

Our State Department is again mortified at the inability of foreigners to understand our pretty tariff ways. This time it is the French. The most lucid nation in Europe, they yet cannot perceive the rationale of our demand that they should give us minimum tariff rates, while we continue to *frapper* their goods with Dingley rates. Our proposals, as reported in Paris by Ambassador Jusserand, have made "an unfavorable impression," and the State Department is expressing "some concern." But this concern is plainly over the intellectual crassness of France. She fails to see how $250,000 worth of Porto Rican coffee can be set off against French wines to the amount of $18,000,000. This is truly pitiful. Apparently, there are too many ex-journalists in the French Ministry. Their training has made them expert in coffee and pistols, but evidently not in coffee and wines.

Accused of sensationalism, and severely attacked for its reckless statements, *The Navy*, the new monthly, believed to be the organ of some of the higher officers of the navy, returned to its attack upon our warships in the July number, which appeared on Saturday. This time its criticisms drew out an official reply. So far, however, from denouncing *The Navy*, Rear-Admiral Brownson's statement admits the truth of most of its charges. There were defects in the Oregon, Kearsarge, and Kentucky, and they were discovered before the ships were finished, but—"the wonder is that there were so few defects, considering that they were the first heavy battleships built in this country." Thus the official statement. Compared with the battleships of other nations, the "Oregon class was distinctly superior." "It is true that their armor was badly placed, but that arose from the addition to the ships of a great amount of material, stores, and machinery not included in the original design." It is also true that, according to Rear-Admiral Brownson, these unfortunate ships lack balanced turrets, that their eight-inch ammunition tubes (?) are not sufficiently protected, and that their turret portholes were so large that a one-pounder projectile could have put the gun entirely out of action. It was to conceal this defect that their commanding officers built wooden shields when they went to Europe, as related by *The Navy*. But Rear-Admiral Brownson finds much consolation in his complacent belief that if we could get behind the scenes in foreign navies we should find possibly a worse state of affairs. To our mind, and we think to most taxpayers, this official explanation is the very reverse of satisfying. Its tone is, moreover, unfortunate in the officer who put it out, save for its frankness. Its admissions render it probable that the rest of *The Navy's* charges are well founded, that not one of our battleships floated as she should at Jamestown. Each one of them failed to show her armor belt at the proper place when loaded for sea. Now, the United States has paid enormous prices for its battleships, and maintains a large number of designers, graduates of Annapolis, who are supposed to know their business, and it would seem to the lay mind as if this called for the ability to calculate what weights will be placed on a battleship when she is ready for sea. Indeed, *The Navy's* revelations, its repeated assertion that the same defects of the Oregon class are reappearing in the designs of our new 20,000-ton sea-monsters, ought to lead to a Congressional inquiry, particularly in view of these admissions of Rear-Admiral Brownson.

The Alabama State Bar Association is doing a good work in agitating a reform of the abuses of criminal appeal. Its Committee on Correspondence has been addressing the bar associations of other States. The circular letter which has been sent out recites the growing scandal in this country of reversals on appeal for error in the trial courts which was not really material. In too many jurisdictions in this country the doctrine has gained standing that an error of ruling, created *per se* to enable the excepting and defeated party to obtain a new trial, must prevail with the higher court. The result is something like 50 per cent. of reversals, or new trials, in this country, as compared with about 4 per cent. in English practice. This evil has been vigorously brought to the notice of the Alabama Legislature by the Bar Association, and we understand that a bill to correct the extravagances of appeal on technical and immaterial grounds is in a fair way of being enacted. Other States should take the matter up. Doubtless an amendment to the Federal Judiciary Act would also be useful. That the abuse of setting aside verdicts for error not going to the merits is great and growing, Judge Brewer has strongly testified.

The second instalment of the report drafted by the Municipal Ownership Committee of the National Civic Federation, makes it pretty evident that the general outcome of the investigations of the committee will be very much like Mr. Dooley's summing up of the results of a certain widely discussed episode in the White House. "Two hundred thousand citizens in Alabama," said the Chicago philosopher—we quote in general terms—"who never voted for a Republican candidate will now cast their ballots for a Democratic President, and an equal number of citizens in Massachusetts who associate Democracy with the devil, will continue to vote for the Republican ticket." With the committee made up half and half of the champions of quite opposite economic views, we can only look forward to a repetition of the sharp divergencies between experts. When we take up this matter of municipal versus individual ownership, it is largely a question of faith or prejudice, as we may choose to regard it. Once the point of view is chosen, the aspect and importance of everything that follows, success

or failure, efficiency or incompetence, dollars and cents, are all predetermined. And where the question is as complicated as this subject of the ownership and administration of public utilities, the chances for different interpretations are almost infinite. When the advocate of municipal ownership points to a gain in dollars and cents at Wheeling, his opponent replies that the service is poor. When the latter points to a loss in dollars and cents elsewhere, the municipal ownership advocate declares that "life, liberty, justice, virtue, and intelligence are of greater moment." And as for political corruption, you may regard it as a vital argument against municipal ownership, or as the product of the maleficent influence of privately owned public service corporations.

A fight for the open shop is in progress at Washington. The labor unions are arrayed against the Master Builders' and the Employers' Associations. The strike will stop all building, with the usual annoyance to employers and the inevitable hardships to the employed. The former, in stating their case, assert that the members of unions will not live up to their contracts; "they will observe an agreement only when it is made in accordance with their dictation." The unions reply that "organized labor cannot view the open shop in any other light than the disintegration of the workmen's organizations, and that proposition they will combat and fight to the last ditch." This is the old issue. The employer is the only one of the two parties who is expected to live up to his contract; and when he does so, he is subject at any moment to an arbitrary strike. Union working men should know how wearied and disgusted the whole community is becoming with their tyranny and untrustworthiness. If needed labor legislation halts, the course of labor organizations has much to do with it.

In appointing Victor H. Paltsits as State Historian, Gov. Hughes chooses an expert for a position which emphatically requires an expert. Hugh Hastings, who has recently resigned as State Historian in order to become a Tax Commissioner in this city, is a gentleman of many accomplishments and admirable temper and industry. He was not, however, trained to historical research; he was never by profession a decipherer and editor of historical documents; and in his work on our archives he was forced to lean on the broken reeds of zeal and general intelligence. Mr. Paltsits, however, has had much experience in the very kind of labor that the State Historian must perform. He was educated with unusual thoroughness; and he has risen to the position of assistant librarian of the Lenox. He has edited the "Journal of Captain William Pote, Jr.," 1745-1747, "Papers Relating to the Siege of Charleston," 1780, the Rev. John Miller's "New Yorke Considered and Improved," 1695, "Captivity of Capt. John Gyles," 1689-1697; he was bibliographical adviser to the editors of the seventy-three volumes of Jesuit Relations and Allied Documents—one of the monuments to American scholarship. He has prepared several standard bibliographies, particularly on historical subjects. From every point of view, therefore, the appointment seems ideal—what we might expect from a man with Gov. Hughes's appreciation of the intellectual side of life. Under the skilled hand of Mr. Paltsits our State archives should become a treasure-house for students of history and the development of our social and political institutions.

No want of feeling makes us say that the reports of Ouida's falling on evil days have a certain æsthetic fitness which must appeal to the authoress of "Puck" and of "Under Two Flags" herself. To live sumptuously in a princely Florentine villa surrounded by many graceful and well-loved hounds, is to reproduce a beatific existence of Boccaccio's time. To be cast out the next week, absolutely impoverished and starving, and to be compelled to seek refuge in the cottage of the mother of one of her servants, but still accompanied by three of her faithful dogs, is like a situation out of Ouida's books. Governments, which always move with pernicious slowness, seem in this case to have belied their reputation, and a British pension of seven hundred and fifty dollars should be sufficient to make the writer secure against actual want in the future. But, then, Ouida is quite capable of spending her annual stipend on one lavish feast for all the homeless dogs in Florence, as reported. To the extent, however, that she is very far above the commonplace mob of us, she is also above the need of our commiseration. It is only to be hoped that the authors of our own best-sellers are wise enough to invest their earnings in New York rather than in Italian real estate.

The dreaming of dreams, especially when it coincides with real events, continues to excite wonder. The Rev. Dr. Rollings, who is studying medicine in New York, fell asleep and dreamed that his "second self" had taken its flight to England, where his father lay in bed surrounded by members of his family. Dr. Rollings saw his father "sink back" and die. Two weeks later, a letter informed him that his father had actually died at the hour of his dream. Of course, spiritualists will attribute such an occurrence to clairvoyance or some such supernatural process. It is really nothing but a coincidence. Thousands of people have dreams of friends dying, without the occurrence of any corresponding event. Such cases pass by unnoticed. But when coincidences take place, a supernatural explanation is given forthwith, and no account is taken of the "negative instances" which make the argument fallacious. An extraordinary case of "clairvoyance" is reported in the Proceedings of the American Society for Psychical Research, by Prof. William James. The body of a woman who had been drowned was recovered through a dream. Professor James says that this story "is a decidedly solid document in favor of the admission of a supernormal faculty of seership." But most men of science would prefer to have more evidence before accepting such a conclusion. When there happens to be a long run of the red at *rouge et noir*, it is not necessary to conclude that there is either fraud or a miracle.

Even the most besotted golfers will be tempted to renounce their favorite game if it is to be infected by a Rockefeller taint. The trail of that serpent has been over all the national amateur championship. All the dispatches from Cleveland have been so filled with the doings and sayings of the oil magnate on the links, that it has been rather difficult to make out who was winning, and what class of play was being exhibited. The turned-up trousers and soft hat and ohs and dear, dears, and hurrahs of Rockefeller have made the accounts of the tournament pretty painful reading. To crown all, we had to submit to a lot of Rockefeller philosophy of golf, pointing out its moral tonic, and showing how it makes men clean, truthful, and modest! An enemy of golf hath done this. For it is hard to think of so fine a sport becoming of itself snobbish and toadying. Still, one remembers Talleyrand in Maine congratulated by a native on the prospect that, in Philadelphia, he would have the opportunity of seeing, not Washington, but the richest man in America.

The movement among German Catholics to do away with the Index of prohibited books, would seem, to an outsider, of little importance. Since it was established nearly four centuries ago by Paul IV., the Index has had decreasing influence, especially with the laity. This has, of course, been due in part to the immense number of books and articles printed in many languages, of which the Congregation can take no note. A short way of condemning heretical literature would be that adopted by Pius V., as well as by his predecessor, of prohibiting in general works issued by certain publishers and printers. Under Pius IX., the number of theologi-

cal names on the Index increased considerably, partly because of the growingly liberal philosophy of the nineteenth century. It was to oppose it that the *Katholik* was founded at Mainz, and that Leo XIII. afterwards issued the bull *Æterni Patris*. The abolition of the Index might momentarily encourage the liberal Catholic movement in Italy, which, under the leadership of Murri and Fogazzaro, is causing so much unrest. But there was a supervision of the reading of the faithful oefore the Index was formally established, and probably a papal condemnation of important theological or philosophical movements in general would suppress heresy quite as effectively as the old way of putting obnoxious publications on a list, with which few even of the bishops are familiar. Certainly, mere outside pressure will not abolish the Index; and this German agitation will very likely succumb to papal discipline. In 1674, when the Congregation censured the Gallican maxims of the Sorbonne, a year did not pass before the offending theses were withdrawn, under the supervision of Bossuet.

Such hope eternal as the Irish Home Rulers cherish, or profess to cherish, has a pathetic quality. Here is John Redmond, for example, just after the apparent dashing for years of the aspirations of the Irish Nationalists, telling them of his confidence that they are nearer than ever to their goal. This is, no doubt, a part of the stock in trade of an Irish leader. It would never do for him to admit that his cause is hopeless; and the darker the immediate prospect, the rosier must be his prophecies. But those familiar with Irish history know how old a story all this is. More than sixty years ago O'Connell was as positive of the speedy grant of an Irish Legislature as Redmond is to-day. Said the latter, the other day: "If the Irish people show themselves in earnest, whatever Government may be in power will find itself at an early date coerced into introducing a bill for the better government of Ireland." In the recent Life of Sir James Graham is published a letter by O'Connell, written June 30, 1846, in which he said: "No man can tell how near we may be to the accomplishment of our best wishes, and in truth our only hope, the repeal of the Union." Of such is the tragedy of Irish history.

The action of the Italian Senate in ordering the incarceration of former Minister of Instruction Nunzio Nasi, who has been arraigned before that chamber sitting as a Supreme Court, on charges of extensive embezzlement while in office, is the beginning of the last act in a *cause célèbre* that has lasted for nearly four years. Nasi's peculations were enormous; his methods showed a simplicity and directness that should command the serious study of high political financiers all over the world. Out of a fund created for the "support of schools and the subsidizing of teachers," more than three hundred thousand lire were distributed to an amazing variety of beneficiaries, including stone-masons, police officers, dressmakers, midwives, "and an infant of twenty-five months." Out of another fund for the subvention of agricultural instruction, pensions were freely granted to "artists without patrons and journalists without journals." When charges were first brought against the erring Minister in 1904, Nasi, from a safe retreat abroad, demanded that he be brought before the Senate as a high court, but the Chamber decided that the case be prosecuted through the regular judicial channels. There ensued three years of legal and political manœuvring. The courts cast Signor Nasi into the arms of the legislature, and the legislature threw him back into the courts. Finally, the Court of Cassation decreed in favor of the Senate's competence. Meanwhile, in his native town of Trapani, in Sicily, Nasi has been a popular hero; he has been repeatedly reëlected to Parliament, streets have been named after his lawyers, and there is even a popular *Inno a Nasi*, just as there is a Garibaldi's Hymn. What his adoring townsmen would have done if Nasi had won the Derby, can scarcely be imagined.

Count Posadowsky, the German Secretary of State for the Interior, who has just retired from office, or, rather, has just been forced out, was the personal choice of the Kaiser for the place, because of his excellent services in the administration of Posen. Now, within two months of completing his ten years of service, he has found it necessary to resign, because he read an inspired announcement that his resignation was about to be handed in. Originally, he was looked upon as a somewhat reactionary official of the ordinary type. To the surprise of all classes, he rapidly developed into a statesman of great ability and of liberal tendencies, particularly in the direction of social reforms and legislation. Having begun as a Junker and Agrarian, he goes out of office particularly regretted by the Liberals and Social Democrats. A more striking case of broadening in office has never been seen in Germany, but the liberalizing process he underwent was his undoing. He was not enough of a high-tariff man to please the land-owners, and he is believed to have opposed the dissolution of the last Reichstag. Hence his rather brutal dismissal. He has been succeeded by the Prussian Minister of the Interior, Herr von Bethmann-Hollweg, who has strong reactionary tendencies. The selection of the new Prussian Minister of Education, Dr. Holle, is also taken to mean that the Conservatives are more than ever in the saddle, despite Von Bülow's overtures to the Liberals.

That the Germanization of Prussian Poland, in spite of the enormous resources with which it has been carried on, must remain a failure, is a common conclusion. The planting of German colonists in Posen has only served to spur on the Poles to adopt their rivals' superior methods of cultivation, with the result that the country is said to enjoy unexampled prosperity. The coming autumn is expected to witness the recrudescence of the national movement in the form of school strikes, violations of the censorship laws with regard to the use of the Polish language, and popular demonstrations. Events in Russia may not improbably stimulate the German Poles to increased resistance. So long as the Duma was in being, and the Polish Deputies continued to be recognized as one of its most important elements, Russian Poland cherished high hopes of a national restoration, in part at least, and their German brethren may have been tempted to rest on their oars a bit to watch the movement of events across the border. Now that Russian Poland's hopes have been shattered, there is evidently nothing left for the Poles everywhere to do but to resume the slow, desperate struggle for their racial existence in the hope of brighter days.

Paris, for some time, has been entertaining his Majesty, Paramindr-Maha-Chulalongkorn, King of Siam, with whom, in March last, France concluded a treaty that is regarded as finally establishing a satisfactory boundary line in Indo-China. The French press calls attention to the fact that, since 1868, Siam has been pursuing a process of national regeneration comparable to that which Japan entered upon in the same year. Instead of the loose feudal relations formerly subsisting between King and local rulers, we find now a firmly centralized system, in which the local dignitaries have consented to take an important part as subordinates of the Government at Bangkok. There is a legislative council appointed by the King, and the executive government is carried on by regularly constituted ministries. The foreign commerce has attained a value of fifty million dollars, though the trade is largely in the hands of the Chinese. It is, of course, well known that two American jurists, Edward H. Strobel and J. I. Westengard, have taken an important share in the work of reform in their capacity as advisers to the King of this progressive country.

WARS AND PHRASES.

As though there were not enough Jingoes, ordinary rattle-brains and conscious mischief-makers, in this country and in Japan doing their best to egg on two unwilling nations into a criminally irrational conflict, our press must needs go abroad for wise opinion as to the "inevitable struggle" that confronts us. And because the European mind is the more inclined towards abstract, or at least generalized, thinking, we find the reasons for a war with Japan framed in imposing formulæ. To a correspondent of the *Times*, Ernest Judet, editor of the Paris *Eclair*, has declared that "the position in a nutshell is that both Powers want supremacy on the ocean called the Pacific, and unless one makes up its mind to draw back, a conflict is inevitable." To speak of Supremacy on the Pacific, as to speak of the Key to the Caribbean or the Waterway of the Future between the Two Oceans, is the ultimate argument of Jingo philosophy. "You simply have got to fight," the argument runs, "because a San Francisco mob has maltreated certain Japanese subjects, or because the Japanese hate you, or because a Japanese fleet is bound for San Francisco. What? You say you refuse to be hurried into war over matters that can be easily arranged? You hesitate before the appalling consequences? Well, then, friend, you must fight anyhow, because the Supremacy of the Pacific is at stake."

It is the error of these facile philosophers of history to imagine that, because certain phrases have become famous in connection with great national and social movements, all that is necessary to set public passion ablaze is to invent some taking cry or epigram. They overlook the fact that wars have never been fought over phrases, but that they arose from great material reasons or emotional crises to which the popular phrase merely gave appropriate expression. Even a vindictive and unreasoning cry like "Remember the Maine" had its basis of validity in a general feeling of bitter irritation, no matter by what means produced. But politicians who would have us go to war for the supremacy of the Pacific show as little comprehension of the springs of popular action as they do of the nature of political catchwords in general. Look at England, Mistress of the Sea, is their argument; look at Germany's Emperor dictating Peace and War to Europe; is it not worth while fighting for as noble a sounding phrase as any of these? They forget that Mistress of the Seas, or War Lord of Europe, represents only the historian's summary or phrase for a succession of events, each of which appealed to Englishmen and Germans on its own merits. Britons, in going out to defeat the Armada, did not say: "Go to; we will now enter on a two-hundred-year process of mastering the sea," any more than the Simian that first rose to an upright position said to himself: "I will now begin to evolve into a Jingo editor."

The *Times's* interview with the Paris journalist contains another gem of thought. Once having laid it down that a Japanese-American war is inevitable, he adds: "I will not venture to say whether it is likely to occur to-morrow, next year, or in the next ten years; but it is the only natural solution of the problem as now stated." The implication is that, inasmuch as a war must come some time or other, the Power that feels itself the stronger to-day should do its best to hurry on the conflict. Our own heroes of the press are accustomed to state the truth in terms of the Panama Canal, the argument running about as follows: "There must be war between the United States and Japan at some time or other; but when the Panama Canal is completed, America's increased strength in the Pacific will leave Japan hopelessly outclassed; therefore it is for Japan's interests to attack us now; therefore there will be war. *Q. E. D.*" Now, we may pass over the sordid cynicism of this mode of reasoning, since we recognize that to call for the application of the ordinary standards of right and wrong to international relations is merely to be old-fashioned and visionary; but the lamentable confusion of thought inherent in the argument should be pointed out. Briefly put, it imagines a situation where two grown-up men are carefully manœuvring for an opportunity to land the first blow, and deduces therefrom that it would be wise for any one of us to go and assassinate the new-born infant son of an unpopular neighbor, lest when he grows up he should succeed in overcoming us.

Even if it be conceded that war, in our present stage of civilization, is an unavoidable evil, or, perhaps, a necessary accompaniment of healthy national growth, is it not patently silly to counsel present war just for the sake of anticipating war in the future? Because it is inevitable that by 1925 conditions should have so developed in the Far East as to force a conflict between the United States and Japan, what good would it do to fight now, when such conditions do not exist? Why not carry the argument to an extreme and, estimating that, on an average, every nation in the next hundred years will spend about ten years in waging war, start in right now for a ten years' spree, and then settle down to ninety years of peace and contentment? Would not most people be thankful if immediately after birth they had been *compelled* by their parents to pass through all the pains of measles, teething, an operation for appendicitis, disappointed love, dieting for flesh reduction, deteriorating eyesight, and senile debility?

THE DRIFT AT THE HAGUE.

The last number of *Punch* has a full-page cartoon on the Hague Conference, which not inaptly expresses the general feeling of disappointment with that body. An idealized figure of Peace stands reading the programme affixed to the door of the Temple of Peace. It runs: "Lectures on the Etiquette of War. Contraband. Capture of Merchant Shipping. Prize Courts." Thereupon Peace soliloquizes: "Always glad to lend my house for a good cause. Still, they might perhaps have asked me to join them. But evidently it's my room they want, and not my company."

It would be rash, or at least premature, to say that this year's Hague Conference will be barren of results. At present, it is true, there appears to be a deadlock on nearly every one of the mild proposals to ameliorate the conduct of war—the immunity of private property at sea, the abolition of prize-money, etc. Even on the subject of prize-courts there is such disagreement that last Thursday Mr. Choate had to move for the appointment of a "harmonizing" committee. As for a permanent tribunal of arbitration, to which all the signatory Powers are to bind themselves to submit future differences, it is as slow in coming as the chariot of Sisera. Thus, if one were to sum up the status of the various plans before the Conference, with the discussions held upon them, he would be almost forced to look forward to something very like failure.

Yet an attitude of modified hope would probably be more reasonable. Doubtless, we expected from the Peace Congress more than we shall get; but we may easily get more than we now expect. The situation is, in that respect, not unlike that which existed after the opening weeks of the Conference of 1899. It began with high hopes, but soon it seemed as if every one of them was to be dashed. In the end, however, valuable results were secured. Hence it is reassuring to read such a review of the history of the first Conference, put into comparison with the negotiations leading up to the second, and with the topics signalized for debate therein, as André Tardieu publishes in the *Revue des Deux Mondes* of June 15. He sketches most suggestively the way in which the Congress of 1899 was rescued from failure. The Czar's proposal for reducing armaments early proved impracticable, and cynicism about the outcome set in and long prevailed. But diplomatists of the number and weight of those convened at Russia's instance really could not adjourn without doing something; and finally they did accomplish a work which, though restricted in scope, was

beneficent in conception and useful in operation. M. Tardieu expects a somewhat similar result this year. It will take considerable ingenuity to find a form of words by which discrepant views may be reconciled, but the likelihood that a few useful agreements will be effected is strong. At the worst, we may fall back upon the comforting remark of M. de Martens, that the mere effort to agree on peace measures has a distinct value.

The one great defect of the Conference, running through all its delays and misunderstandings and inconclusiveness, is the lack of a sharply precise and definite programme. Means of abolishing war, clear-cut proposals to disarm, the erection of a great court of arbitration to which all civilized nations shall be bound to refer their quarrels—these things could be clearly discussed. They would furnish a basis for a positive decision, one way or another. But when you get together to confer about the "etiquette" of war, about the more or less of cruelty and barbarism to be tolerated, then you instantly run off into all these fine shadings and subtle distinctions and intrigues by selfish interests which to-day, like so many green withes, bind the Conference and impede its action. It is all very much as if the duello were under discussion, and grave men should argue, not whether it ought to be done away with altogether, but whether duellists should fire at the drop of the handkerchief or on the count; whether there should be a nurse as well as physician in attendance; and whether all bullets and swords used should not be made antiseptic!

It was, of course, involved in the terms under which the Conference was summoned that it should not directly labor for the abolition of war; but the unfortunate consequence is such floundering as we now see at The Hague. You will not make much headway in putting an end to prize-fighting if you limit yourself to discussing amendments to the rules of the Marquis of Queensberry! And it is unhappily the case that a quiet assumption that war must and shall be preserved has underlain many of the Hague discussions. Even the alleged meliorators of war are not consistent, when it comes to the pinch. As Sir John Macdonnell points out in the July *Contemporary*, those, like Capt. Mahan, who oppose the exemption of private property at sea, affirm that to do so would be to make war less terrible, and so diminish the deterrent motives which keep nations from it. Yet their professed aim is precisely that of making war less terrible! But when it is proposed to make it so and also less *inviting*—to take away the prospect of prize money—the meliorators promptly abandon their position, and take ground which, logically, would compel them to defend every savagery of war as a deterrent.

It appears certain, as we say, that the high anticipations of convinced lovers of peace will not be realized by the Hague Conference. Yet it may be hoped that some humane agreements will be reached. Starting afresh from them, it will be in order to press on the work of making war as unthinkable as the ordeal or the duello.

THE HARRIMAN REPORT.

Mr. Harriman's criticism of the report of the Interstate Commerce Commission on his railroad operations is (1) that it was marked by malign secrecy in the manner of its publication; (2) that it is not so much a public document as "a personal pursuit of me." Either point, his own lawyers could have told him, is *aliunde*. The report was given to the press associations in the usual manner of such official publications—that is, labelled "confidential," with a fixed date for "release," before which no part of it was to be used. Even if this were not the regular proceeding, it would not affect the validity and significance of the facts embodied in the report. They stand as of record. They were, indeed, largely brought out or verified by Mr. Harriman's own testimony at the public inquiry.

His charge that the Commission was unfairly "personal" in dealing with his transactions, strangely overlooks the nature of the case in hand. The report was not a Presidential speech, with its necessary vague generalizations about "the man who," or "any citizen who would," or "the evildoer," no names being mentioned. It was a specific inquiry into the specific misdeeds of a specific man; and not to out bluntly with his name would have been ludicrous. There is no question whatever of personal animus. The financial operations uncovered by the inquiry, and epitomized in the report, would not have smelled sweeter by any other name than Harriman.

Indeed, the Commission is not so directly hostile to Mr. Harriman as it had been expected to be. His prosecution for violation of the law is but vaguely hinted at. Even that stout determination to vindicate the Commission's jurisdiction, of which we had heard so much, and to compel Harriman to answer its questions about his personal speculative interest in the securities of the roads which he was manipulating, nowhere figures in the report. Yet it is scarcely conceivable that this purpose has been abandoned. All questions of personal antagonism, or personal consequence, put one side, it is of great importance that the Commission's powers of investigation be judicially defined. Unless, therefore, the intention is to let Mr. Harriman off with a perfunctory scolding, we must believe that the questions which the Commission put to him, and which he refused to answer, will be certified to a Federal court with a request that an order be issued directing him to give the facts about his stock-market activities. We are not yet ready to take the view, held by some, that Harriman is really well content with the report as it stands, and is satisfied that nothing more will be done.

If any one looked for sensational matter in the report, he was doomed to disappointment. There is nothing new in it. What we have is simply a review, very full, and, as it seems to us, scrupulously fair, of the evidence elicited at the hearings. If there is anything severely condemnatory of the Harriman methods, this lies in the recital of the facts, not in any punitive attitude of the Commission. The Alton affair comes in for the most trenchant arraignment, but this, again, arises merely from the lucid way in which the whole truth is set forth. The terrible summing up, of which it is open to Mr. Harriman to dispute the findings and figures if he can, is as follows:

> Taking the original cost of the property as it stood upon the books of the Alton Company December 31, 1898, as $39,935,887, adding the amount which appears by the testimony of Mr. Harriman, Mr. Felton, and Mr. Hillard to have been spent upon the property out of the new capital issued after Mr. Harriman and his associates obtained control of the road, to wit, about $18,000,000 (including the cost of the 58 miles of the Peoria road at $3,000,000), it shows that the foregoing liabilities of over $113,894,000 were placed upon property which had originally cost approximately $58,000,000, or an increase of stock and liabilities upon the road, for which not a dollar of tangible property had been added, of practically $56,000,000.

After this, it is not necessary to speak of the handling of the Alton securities, under the Harriman régime, as "rich in illustrations of various methods of indefensible financing."

Most people will think the Commission's final "Recommendations" meagre and disappointingly vague, if not conflicting. It is strongly urged that railways be confined to the business of transportation, and not allowed to invest "generally" in the securities of other railways or steamship companies. Yet many exceptions are at once indicated. "It is in the interest of the public to facilitate the consolidation of connecting lines." Is this a stone aimed so as to hit Harriman, but miss the President's friend Mellen? At all events, the legal and legislative difficulties encountered in attempting to prevent the consolidation of the New Haven and Hartford with the Boston and Maine, fall at the very moment of the appearance of the report to emphasize the fu-

tility of its mere generalities. The fallacy that lurks in these is plain in the last of the Commission's recommendations against the "inflating" of railway securities "for merely speculative purposes." Granting that this should be done, there is not the remotest suggestion how it could be done, either in law or practice. All told, therefore, we regard the body of the report as more valuable than its conclusions. The former sets out a body of ascertained fact; the latter are far less a plan of action than the expression of pious hopes.

THE ART OF STEALING CLOTHES.

In a German newspaper, Jean Jaurès, leader of the Unified Socialist party in the French Parliament, attempts an estimate of what has been accomplished by the three Socialist politicians who since 1899 have consented to assume ministerial positions. These men are MM. Millerand, Briand, and Viviani; and the writer's opinion, based on the career of all three, is that it decidedly does not pay to coöperate with the bourgeois elements, who have shown themselves able to "exploit" the proletariat's leaders as well as the proletariat itself. To M. Millerand, who became Minister of Commerce under Waldeck-Rousseau at the height of the Dreyfus crisis, M. Jaurès pays liberal tribute for his activity in establishing a ten-hour day for woman and child workers throughout France, his encouragement of the trade-union movement by according political recognition to the "syndicates," and his agitation in favor of old-age insurance, which resulted in the enactment of such a measure by the Chamber last year. But M. Millerand fell a victim to ambition, and instead of devoting his great talents to the welfare of his party "and hastening the hour when the working class, powerful enough at last and disciplined enough, might call into being and keep in being a 'government of social evolution,'" he chose to follow his own way towards the Premiership. As for M. Briand, he is only an unscrupulous wire-puller and "climber," who has grown from a fire-eating anarchist into a cheap Moderate, and is planning to swim into power on a Conservative wave.

"They steal our men," so we may sum up M. Jaurès's summary of the situation. And he proceeds to point out with exultation, though it is a somewhat wry-faced enthusiasm, that the "bourgeois" republic cannot dispense with the Socialists. "If it cannot obtain the coöperation of the moderate Socialists in carrying on the work of racial reform, it turns to the renegades from revolutionary Socialism in order to pursue a policy of repression. It cannot get on without the support of the working classes; it cannot even get along without traitors from our ranks." We may grasp the reason for the writer's bitterness when we recollect that, while Socialists, like all parties, have become accustomed to see their principles appropriated by their opponents and put into practice, in more or less modified form, under a more or less modified name, they have not yet learned how to remain unmoved when they see their leaders pass out of the camp or into the enemy's lines.

And yet it is difficult to see how fairly moderate Socialists of the type of M. Jaurès can look forward to any other future than one in which Socialist ideas and Socialist thinkers shall gradually filter over into bourgeois strata and fructify the barren soil—a process, however, which peacefully can go on only to a certain extent. Socialism in Europe has been recognized before as being two-fold in character: first, it stands for the abolition of private property, and, second, it stands for any number of social reforms, general or local in nature. Now, while Socialism may count upon the uncompromising hostility of the present order towards its main tenets, it must expect to see its secondary reforms, many of which are admirable and undeniably called for by European conditions, accepted one after the other by the parties in power. But it has been the mistake of French opportunists to imagine that they could advance through minor conquests to their ultimate aim. The so-called bourgeois parties will make concession after concession in the way of social reform, and when it comes to the sharp decision between the present fundamental order and collectivism, the *impasse* will be as sharp as ever. Premier Clemenceau formulated this thesis in a brilliant manner during his great debate with M. Jaurès last fall. "We take your ideas," he practically told the Socialists, "and carry them out, but we remain individualists." Or, to put it into homely form, "We are ready to wear any clothes you may prove our health or our good looks require; but we will *not* go naked."

Bebel and the German Socialists have clearly recognized the twofold nature of the Socialist programme, and have, logically enough, refused to take office under a "bourgeois" régime. They reason that the essentials of Socialism cannot be carried out until a majority of the nation has been converted to the true faith; and as for the secondary reforms, the "bourgeois" government can be forced to adopt them anyhow, without going to the trouble of converting good Socialists into bad Ministers. In other words, until they are strong enough to pass a law making it obligatory to go naked, the German Socialists are quite willing to let the Government go on stealing their clothes. As an Opposition party, they undoubtedly have pushed Germany in the direction of democracy. What is called State Socialism, Christian Socialism, coöperative movements of varying kinds, have all been stimulated by or risen in response to the Socialist propaganda. The same is true of Belgium, where the Socialists have forced the Catholic majority to adopt progressive labor legislation; and the same will probably be the case in Austria under universal suffrage.

When we come to the illogical Anglo-Saxon, it is more difficult to foretell how far he may carry the game of garment-stealing without owning up to it. With us, the label is still powerful; a fatally radical theory propounded by an unsafe Democrat, becomes a principle necessitated by marked changes in our national life when proposed by the party that never errs. Government *ownership* is a harmful thing, but if a Trust is wicked, the Government may *run* it; and so possibly some day it may be discovered that one might be right in discarding *all* his clothes, if we consider that, after all, he would be wearing a fine suit of epidermal tissue. In one of Anatole France's late philosophical romances there is a vision of Europe organized as one vast Socialistic federation under a republican form of government. England, however, is represented as constituting a separate Socialistic state—with a King and a House of Lords.

TRAINING FOR MUSEUM WORK.

We have before called attention to the new and interesting profession that has been opened up through the growth and creation of art museums, and noted that the supply of curators falls far short of the demand. If anything, the dearth of this kind of talent is likely to increase for a time. The older museums are unable to find department heads, and through such benefactions as that of Messrs. Johnson, Widener, and Elkins of Philadelphia, new and important galleries are founded as full grown. Meanwhile, directors seek in vain for experts, or bring them over the water.

Indeed, one may say that it is easier to find a good director than a competent staff of curators. Executive ability is not rare among us, and a number of organizers, frequently trained for other professions, have acquired a discursive knowledge of the whole field of art and a personal acquaintance with collectors and experts that fully qualify them for their new duties. In fact, men of this type are often preferable as executives to specialists. The smaller museums, and especially those that devote themselves to our own art, will generally be managed by a single chief of this character.

As for the museums of broader scope, it may be asked, Why should they not select promising young men and let them grow up into the curatorships? This argument might be supported by

the example of several curators of American training who, making the most of very slender advautages, have shown much energy, and have gained more than a respectable position. But a very little reflection will show that our museums are as yet too new to serve as training schools. In no department of any of them could a student hope to gain the material knowledge that is expected of a curator in a great European museum. And aside from the scantiness of the actual materials of research, the isolation of a young expert among us is in itself narrowing. Better than formal studies is association with seasoned connoisseurs, and this can as yet be had at home only in very scanty measure.

Since the career is open and attractive, one may assume that gradually the right persons will appear, even without organized encouragement. But meantime the need is acute. Our rapidly growing collections are either uncatalogued or inadequately listed, and through the very growth of departments the scieutific arrearage mounts up formidably. We need a supply of trained curators, and need it now, and sorely. Young men of considerable preliminary training and of uncommon initiative may, of course, study in such institutions as the École du Louvre, but we really want a training more generally available. Theoretically, the best way to meet the case would be to organize a museum school in one of the European capitals, preferably Paris, at which research in the history and connoisseurship of art would be conducted by great specialists, in the local museums. A rudimeutary plant and organization would suffice, a mere headquarters and working library. Nothing elaborate in the way of a faculty would be required, for the lectureships would chiefly be filled by European specialists, the courses varying according to the personnel of the student body. The residential term would be short, since such studies presuppose wide travel. As for ways and means, it might in the long run be good business for our museums to support such a school coöperatively, as, with private aid, our universities and colleges sustain the American School at Athens.

And here arises the query why such schools of archæology as those of Athens and Rome should not undertake this work. Evidently, it would be germane to their purposes, but unfortunately, neither is at present on a basis to give instruction of this special kind. On the other hand, both possess working libraries and the nucleus of a faculty. To add a museum department to either would be far less expensive than to begin afresh. Probably there is greater hope in raising these schools to a higher power than in founding another feeble American school on European soil. But, frankly, if either the Roman or the Athenian schol were to undertake this new function, a considerable reform and expansion would be necessary.

Considering the dearth of trained curators more broadly, a practical person might imagine that something could be done by coöperation, one expert cataloguing and arranging the collections of several museums. To meet an emergency, something of this sort may be and is being done. The Metropolitan Museum, for instance, borrowed Professor Morse of Boston to catalogue the Japanese potteries. In many cases it would be good policy to invite a European expert to put a department in order and lay down a scheme for its regular growth. On the purely scientific side, much may be done by such exchange of services. When it comes to buying, however—in many ways the most delicate function of a curator—it is evident that he cannot serve two masters. Coöperation, then, is at best a makeshift, and we face the necessity of manning our rapidly growing museums with really qualified officials, with much the feeling of the Hebrews who were bidden to make bricks without straw. For a wealthy donor to provide a proper training for this important and neglected branch of public service would evince an originality in benefaction rarely displayed in that hackneyed pursuit.

MUSIC IN NOVELS.

The heard melodies of real life are sweet, but the unheard melodies of poetry and prose fiction, if not sweeter, are more surprising. At times they even fill the reader with dismay. The first syllables of recorded time describe the strains from the fibula, the lyre, and the *tenuis avena;* in Dante there is the sound of the *angelica tromba,* while Dryden brings forward a whole orchestra in the St. Cecilia ode. There is a fascinatiou in Lucie's *clavecin* in De Musset's poem; and we admire the young man in "Maud," who sat up all night listening to the strange trio of "flute, violin, and bassoon." But it is in our later romance that music is most vividly described.

Sometimes it is vocal, and then not always of the best quality. There are female characters with untrained but powerful voices; there are artistic performers with weak voices; there are heroines with a low, rich contralto, and heroes with tender baritone voices. The number of high sopranos is, however, small; and there are almost no tenors. Every novel-reader knows the unhappy lady who has to take to the opera or concert stage for a living, being trained for her profession by an imbecile foreigner who speaks broken English and is himself in reduced circumstances. There are, moreover, flute-players. In novels the flute always "quavers," whereas in real life it pierces the ears and ruffles the temper. When American novelists tell about Bohemian life, they always bring on a flute-player, living in some street near Washington Square. It is inevitable, it seems, that Bohemians should pursue music, and have rooms in the neighborhood of South Fifth Avenue, although the chance of artistic advancement in that quarter is rather less than that of suffering from ptomaine poisoning.

Another familiar musician of fiction is the organist who sits alone in the church, pulls out all the stops, and fills the place with "glorious harmonies," until the heroine steals in, conceals herself in a pew, and at length emerges, to the embarrassment of both the player and herself. Harps went out of fashion with harpsicords; so the favorite instrument of the newer writers is necessarily the piano. Not all players have the virtuosity of Major Ponto's governess, who could play "Getting Upstairs" with variations, and who, having got the tune to the top of the landing, "hurled it down shrieking to the bottom floor." Musical experts have little patience with the sentimental young woman in the novel who relieves her feelings by letting her fingers "wander over the keys." Descriptions of such slovenly playing have ruined the technique of many a boarding-school miss. But occasionally, in turning to the exquisite fiction of our own time, we come upon real musical prodigies. Such an one was Martin Challoner, in E. F. Benson's artistic novel. He had been forbidden to have a piano in his rooms at Cambridge, but that made no difference. He could "even play Wagner on the piano"; and one lady said, "I believed he had instruments concealed about his person." The rector was not pleased when Martin played Lohengrin on the organ during the church service; but the player's friends were enraptured by his proficiency and the extent of his repertoire. When, for instance, he had finished "the fourth étude of Chopin," the heroine said, "Martin, play the Brahms variations." Next a great Russian performer exclaimed, "Play, if you happen to know it, really know it, I mean, Chopin's fifteenth prelude." He played it "so the rain beat, the gutter choked, the chariots of God thundered overhead, one ray of sunlight gleamed."

The Russian, although he practised for three hours "a couple of passages out of the Waldstein sonata," was no match for Martin. The latter's taste was very modern, and he made fun of the Hallelujah Chorus. Both these men of genius thought that Schumann was "stodgy," but they delighted in Bach. There was no stodginess when Martin got to work on one of the "Suites Anglaises," for, "like a cloudless dawn with the singing of birds after a night of storm and thunder, the exquisite melody

flowed from his fingers, precise, youthful, and joyous. . . . It sang as a thrush sings, . . . danced in a gavotte, moved slowly in a minuet, and romped through a bourrée like a child."

According to the new psychology, Martin must have been a degenerate, as he could not distinguish clearly between sounds and colors: "C-major is red. And F-sharp is blue—electric blue, like the grotto at Capri," he said. When he played "Chopin's first ballade," the heroine found herself "sitting bolt upright in her chair, with a strange tingling excitement spreading through her, and a heightened and quickened beating of the blood." And no wonder, considering what the piano was doing; "the wild lantern of the storm flared this way and that, and once more again after that stupendous riot in the skies the hot darkness was punctuated by the dreadful melancholy of the dripping rain."

We should have liked to hear a duet played by Martin and a fiddler-hero described in a recent American story, who could play "Wieniawski's B-flat concerto":

> First came a slow pure clematis of melody, delicate, archly fair, innocently unfolding, shyly confiding to a close. Then a rhythmic, vigorous second underran it, overbore it, nearly obliterated it, and the duality became a struggle—a struggle with an ache in it.

The only musical instrument which has not yet invaded the novel is the phonograph. But we shall doubtless soon be told how Jessamine carefully adjusted the disk, and how the full-throated melody seemed to make the Great Caruso a visible presence. The novelist may forget to add that the hero at once escaped through the low Tudor window and lighted a cigarette.

AUSTRALASIAN LITERATURE.

SYDNEY, June 12, 1907.

"No age can write its own history" or its own political biographies. James Drummond's "Life and Work of Richard John Seddon" (Christchurch and London: Whitcombe & Tombs) is able and painstaking; the writer has lived through the events that he narrates, and, as a journalist, has closely followed them day by day; though an admirer, he is not a blind partisan, and his work is reasonably impartial. As an account of the political history of New Zealand in the last quarter of a century, it may be accepted as eminently useful, if not quite definitive. For there are passages in the narrative where the stage is not as fully illuminated as it needs to be truly seen, and where important personages and incidents are left in shadow. Thus, the circumstances connected with Mr. Seddon's appointment to the premiership, in 1893, and the share of the Governor therein are not all related. The consequent struggle for the premiership between Seddon and the present chief justice of New Zealand, which should have found a separate chapter, has been ignored. All hung on that. Had it been otherwise settled, New Zealand, and after it Australia, would assuredly not have committed themselves so strongly, and might never have committed themselves at all, to intervention in the Boer war. The spirit of Imperialism would have been checked. The reaction of the Australasian colonies on the Motherland would have been weaker and less injurious. That victory not won, all Seddon's future would have been a blank and his past valueless. Certain chapters are, moreover, inadequate. While the history of the female suffrage movement, from its inception, is carefully given, the later stages of it are slurred over, because a true narrative would have reflected disadvantageously on the subject of the biography. Still more inadequate, to the extent of being positively false, is the account of the introduction of the Licensing bill. Nor is it true that the overwhelming majority at the polls in 1893 was for Seddon; it might have been for Stout; in reality, it was for a strict temperance measure, to which the ex-publican was opposed. In describing the impending bankruptcy of the Bank of New Zealand, only averted by the prompt action of the Government, Mr. Drummond does not mention Justice Gillies, who precipitated the crisis. Even when he has single happenings to tell of, he sometimes passes them by. He makes no mention of the two strokes of paralysis that foreshadowed Seddon's premature death, or the consequent trip to the South Sea Islands, big with consequences. The narrative of the fatal, and yet glorious, visit to Australia falls far short of the reality.

Mr. Drummond is not entirely to blame for the omissions and perversions. He was writing in the lifetime of his hero, when the whole truth could not be told. He was treading on the embers of still-smouldering fires. We can less easily forgive him for not making the most of his opportunities. Has he "no feeling for his business" that he has no word for the solemn arrival of the coffin in New Zealand at dead of night, when the crash of cannon from the warships "smashed the morning," and echoes rolled round and round the hill-encircled city? We also miss living portraits of the various personages mentioned, who pass before us like shadows. Yet Seddon's career was so remarkable that his biography furnishes lessons of all kinds for the public men of other countries. To American readers the chief interest of the book will be found in the detailed history of the labor legislation in which he played so large a part.

Mr. Seddon, who was a son of Anak, was a legitimate descendant of another Titan, Frederick Edward Maning, the author of "Old New Zealand, by a Pakeha Maori" (Whitcombe and Tombs). Pakeha Maori was the designation given to a white man living among the Maoris in the days that preceded the British annexation of the islands. Such Pakehas lived with the Maoris as the French settlers in Old Canada lived with the Indians. Maning married the daughter of a Maori chief, and reared a "dusky brood." An immigrant, he was naturalized as a member of a powerful tribe; a gentleman by birth, he at once became "a *rangatira* of the first water," or chief; an educated man (he was the grandson of a vice-provost of Trinity College, Dublin), he was consecrated a *tohunga*, or priest, but to the last, he refused to divulge the mysteries of his order, though he always wrote of the *tohungas* with execration. The manners, usages, and sentiments of the Maoris he did, however, describe in a volume that is doubtless unique. For the first time the life of a savage people was related from within. The *tapu* (taboo, both consecration and excommunication) in all its forms and variants, with the terrible penalties consequent on the breach of it; *muru*, or legal robbery; *mana*, or prestige, are precisely defined and strikingly illustrated. The approach of an armed band, the war-dance, and the *tangi* (lament) are vividly described. A lurid sketch of a spiritualist *séance* shows Tyler's assertion, that these things belong to the stage of barbarism, to be correct. On such occasions all were, quite literally, in deadly earnest; and Maning's account of the "atmosphere of belief," the "taking of the feelings by storm," and the completeness of the deception would furnish a commentary on Bagehot's essay on "the emotion of conviction." His remarks on suicide prove the falsity of Durkheim's generalization. All this and much else form a happy hunting-ground for the sociologist, while the narrative is picturesque, often amusing, and at times enthralling.

There would seem to be a great gulf fixed between the roystering Lever of Maori life and the decorous missionary's son, who lost his judgeship for exposing the corruption of the Native Lands Department in New Zealand. Yet they had much in common. In his later and respectable days, the Bohemian was appointed a judge of the Native Lands Court, and both he and Wilson are authorities of the first rank on everything relating to the Maoris. As a judge, John Alexander Wilson was exceptionally well placed for understanding the institutions and ascertaining the traditions of the Maoris, and his "Story of Te Waharoa; together with sketches of ancient Maori Life and History" (Whitcombe and Tombs) is a "documented" twin treatise of high importance. It has been compiled from the MSS. of his father, who was one of the earliest missionaries, from unwearied personal inquries, and from the records of the courts. Judge Wilson is no such racy writer as Maning, and no such vivid sketches light up his pages. He is historical, where Maning is descriptive. His materials carry him back hundreds of years—to the times preceding the later Maori immigrations. He carefully distinguishes the earlier from the later strata of the population, and traces their separate usages to the two different but afterwards blended strands. (Here, however, it must be interpolated that his results, which have been disputed, must be carefuly sifted and not always implicitly accepted.) He describes lucidly their primitive communism and its gradual break-up. He tells of the women who led migrations and founded tribes, who caused tribes to be annihilated from revenge, who headed bands of Amazons and routed the enemy; but he tells also of women who got doomed villages to be spared, and who terminated inveterate hostilities by their mediation. The publishers who are re-issuing these New Zealand classics, handsomely got up and cheaply

priced, have earned the gratitude, not only of New Zealanders, but of all who are interested in the life and the history of savage peoples.

In a new and interesting preface Judge Wilson states, not as a belief, but as a fact, that a fair race preceded in New Zealand the immigration of the two brown races. Just this conclusion had Prof. Macmillan Brown arrived at in the articles now reprinted as "Maori and Polynesian," (London: Hutchinson). There he applies the thesis to the stratification of races in the Western Pacific with a wealth of erudition and a power of imaginative presentment that have no previous parallel in the same field. All that the author asks is that his argument shall receive an unprejudiced hearing. The evidence in favor of the conclusion seems preponderant, but in any case the volume is one of surpassing interest and scientific importance.

Political economy would appear to be out of date in these colonies, where ministers scout it, and legislation flies in its face, where political economy societies die out and an uncut copy of the "Wealth of Nations," with McCulloch's "Dissertations," can be bought for a shilling. Yet we are called on (a little late in the day) to notice a bold bid for a re-hearing of its claims. Fathers have sometimes had to continue the work of their sons, like that of "the apostle" Eliot, but H. Stanley Jevons more fittingly continues the work of his distinguished father ("Essays in Economics," Sydney: Angus & Robertson; also Macmillan). The late Professor Jevons was the founder of what his son names the Hedonic School in Economics. The economic theories of Adam Smith, when expounded in Glasgow College, startled the Glasgow merchants, and when Professor Jevons broached the views afterwards developed in "The Theory of Political Economy," the shrewd Lancashire cotton-spinners suspected that much learning or, rather, over-much abstract reasoning had affected the professor's sanity. There was literally a method in his madness, however. Taken up by Gossen, the new method has since been elaborated by Professor Pantaleone of Rome, and it is now being applied to the chief economic doctrines by Jevons's own son. His object is to fill up some of "the numerous gaps to be found in all existing text-books," and he shows no lack of originality in carrying out his plan. The book abounds in new terms, new definitions, new laws, new results. The distinctive feature of the method is the application to economic facts of the curves, perhaps first used by Babbage. It is here applied to the themes of Pleasure and Pain, Utility, Labor, Exchange and Capital, Rent, and Production. The variations of the curves are described, and their causes elucidated. The new developments not only found the science on psychology, but bring it into close connection with mathematics and mechanics. Political economy is thus treated as an exact science, to be cultivated effectively only by those who are trained in the methods of the physical sciences. Few are as well fitted to advance it as the young professor who relinquished a career as a geologist in Sydney in order to return to England and pursue an hereditary vocation.

A new note in Australian poetry is struck in "The Secret Key and Other Verses," by George Essex Evans (Sydney: Angus & Robertson; London: Australian Book Company). The "weird melancholy" of the bush had spread like a pall over earlier Australian verse, because it was sung by defeated men in a country where man had still an unequal battle to wage with nature. There are elegies and threnodies in this collection, but the pæan is now the measure, and it is raised by singers who are confident of themselves and proud of their country. Mr. Evans has succeeded Brunton Stephens as the poet-laureate of "Earth's mightiest isle." In a finely touched "Australian Symphony," with "undertones, weird, mournful, strong," he prophesies:

> Not as the songs of other lands
> Her song shall be,
> Where dim Her purple shore-line stands
> Above the sea!
> As erst she stood she stands alone;
> Her inspiration is her own.

He celebrates her historical events and her great days, her notable men and her "women of the west" in the musical verse of one to whom rhythmical utterance is a necessity. We understand the place and function of poets when we read such poems. They furnish their portion of the æsthetic accompaniment without which the history of a country would be as incomplete as a symphony without counterpoint.

Australian fiction is changing, like Australian poetry, and it is finding in the life of its cities themes less melancholy than the bush had supplied. Almost every man has passed once at least through a critical period when his life neared or reached a tragic point, and is fit to be presented in æsthetic form. So in "Bubble Reputation," by Alfred Buchanan (Melbourne: George Robertson & Co.), a collegian turned journalist skilfully blends a narrative that has the ring of autobiography with the story of the progress of the labor movement. Indigenous in substance, it is mimetic in form. Gertrude Atherton is widely read and intensely admired in Australia, and one of her books has had the honor of being publicly cited by a State attorney-general. "Bubble Reputation" is one of the offspring of that passionate and realist tale, "Patience Sparhawk and Her Times." The general conduct of the story is similar in both; it works up to a like crisis, and many of the characters could be arranged in pairs. Most of those in the Australian novel are well-known figures in Sydney society and public life. The labor minister, who is meditating apostasy in order to become fashionable; the leader of the bar; the leader of the Opposition; the labor leaders and their intrigues; the press and the editor; "dæmonic" women, and the Sydney buck—are all skilfully drawn. The enchanting background of the Australian Corinth and its intoxicating nights, where the "Hymn to Proserpine" is more in keeping than "St. Agnes's Eve," the Randwick race course and its fascinations, are so described as to be realized. It is perhaps the first Australian fiction where the new social variety called Australian life, in all its brightness and gayety, has at last been vividly portrayed.

J. C.

NEWS FOR BIBLIOPHILES.

George Meredith's first book, a volume of "Poems," published with the imprint of John W. Parker & Son, in 1851, has always been the scarcest of the first editions of this author's writings. Of the copies that turn up in the market, fully one-half, it should seem, are presentation copies. The book apparently had a very small sale, and the author may have kept copies by him which he disposed of by giving them to his friends. We have recently seen a letter which shows that the book was printed at the author's expense, that the edition was 500 copies, and that 100 only were bound at the time of publication. This letter, which was written to I. Vizitelly, the printer of the book, is dated only "Weybridge, Thursday noon." It is, in full, as follows:

> Will you have the kindness to send me your account for the printing (500 copies), together with the binding of 100 volumes, immediately? as I am anxious to know whether the amount has overstept my calculations, or not. I trust the publication of the volume will not be delayed beyond Saturday & that I shall receive a volume from you on Sunday morning? Not receiving the Dedication and Titlep. has made me fear another delay.

The edition of Meredith's "Evan Harrington," published in New York by Harper & Bros., is dated 1860, whereas the first English edition, published by Bradbury & Evans, is dated 1861. It is probable that the latter was actually published in the autumn of 1860, and post-dated, as was the custom. Harper's edition was probably printed from an advance set of proof-sheets, or possibly from a transcript of the author's manuscript. There are several differences in wording on the first page, but no extended word for word comparison of the two editions has been made.

Three other books by Meredith were first issued in book form in the United States. "The House on the Beach" was included in Harper's Half Hour Series, in 1877. It was a small 32mo pamphlet, price 20 cents, but is now very rare. "The Case of Gen'l Ople and Lady Camper" and "The Tale of Chloe" were published at 25 cents each by the John W. Lovell Company in 1890, the first being issued under date of June 23, and the second under date of July 7. These three stories were first collected in England in 1894.

Reports have been received on a few lots at the sale of the library of the Dukes of Altemps, sold by Sotheby, July 8. A Homer in Greek, printed on vellum (only two others known), at Rome, 1542-51, four volumes, in the original Venetian binding of brown morocco on heavy oak boards, brought £251. Raoul le Fevre's "Recueil des Histoires de Troyes," Lyon, 1490, lacking title and two other leaves (one probably a blank), brought £175. An undescribed edition of Cato in Italian, twenty-six leaves, brought £21.

The world of letters owes too much to the Vicomte de Spoelberch de Lovenjoul for his death (July 4) to pass without notice. He was a Maecenas, not of the men of letters themselves, but of their literary remains. He had passed his life and spent his fortune in saving from destruction the original manuscripts of books, letters, household accounts, marginal scribblings of the great French writers of the nineteenth century; his industry extended to printers'

BROOKLINE PUBLIC LIB

proofs corrected by the author. All these, with first editions, he stored and classified and described in his great private house at Brussels. The whole collection now goes, by his will, to the Institut de France, to be kept for students' reference and visitors' curiosity in the Château of Chantilly, left for such purposes with all his own collections by the Duc d'Aumale. The scrutinizing Vicomte had been at work for more than half a century. After Balzac's death he rescued manuscripts from butcher and baker and corner grocer, who were using them to wrap up their merchandise. Some one, of course, had cast them aside as refuse after the voluminous writer's death. Material was found for more than one volume of unpublished Balzaciana, among the rest a "bourgeois" tragedy which was found in a corrected proof of the author. There were letters of Théophile Gautier in this omnivorous colection; of George Sand and Alfred de Musset; of Alfred de Vigny. From these documents M. de Lovenjoul had already compiled a new species of book, not the least important in the history of literature—his "History of the Works" of Balzac and of Théophile Gautier. During life he was always ready to put his treasures at the disposition of every genuine student; they will now be open to independent research. It is to be hoped that the minute erudition of the collector has been left in some manageable shape, like an annotated catalogue of his unique collection.

Correspondence.

E. L. GODKIN AND JOHN CASSELL.

To the Editor of The Nation:

Sir: I have been reading with very great interest Mr. Rollo Ogden's "Life of Edwin Lawrence Godkin." The early connection of Godkin with the firm of Cassell is mentioned, but Mr. Ogden could not identify the magazine of which he was the sub-editor. I think I can supply this information, and also show that the work was excellent training for Godkin's future. John Cassell was a native of Manchester, where, after working in the factory, he became a carpenter. In the early days of the temperance movement—in 1833—he heard a lecture by Thomas Whittaker (the father of the present Sir T. P. Whittaker), and became an ardent advocate of "teetotalism." With a watchman's rattle, as he passed from village to village, he called the people together to hear what he had to say on the subject. After establishing a profitable business in the sale of coffee, he became also a publisher. He first started with the *Teetotal Times*, and then in 1848 began the *Standard of Freedom*. On January 5, 1850, he issued the first number of the *Working Man's Friend and Family Instructor*, and it came to an end March 26, 1853. It was a soberly written paper, appealing in the main to the skilled artisan class with whose thoughts and needs Cassell was familiar. The contributors included William and Mary Howitt, Frederika Bremer, Charles Swain, Harriet Beecher Stowe, Jules Verne, Émile Montegut, and others. The magazine was issued at a penny a week, and contained tales, sketches, poems, lessons in French, and a wide variety of other matters. The ideals were self-help, universal peace, the widening of the franchise, religious equality, free trade, temperance, and all that which in 1850 was meant by the Radicals when they used the word "Progress."

One of Cassell's many ideas was that of encouraging working men and women to attempt literary composition—an excellent idea in many ways. He may have thought that he would thus make vocal some mute Milton and render him glorious, but apart from that desire a full knowledge of the mother tongue is best attained by a serious effort at expression. Those who have struggled with the difficulties of intelligibly and adequately stating their own thoughts will be all the readier to appreciate the greatness of the masters of style. Cassell did not find any Shakespeares or Miltons among the workmen. Perhaps his greatest discoveries were Janet Hamilton, the Scotch shoemaker's wife, whose homely verses gained her a meed of fame, and John Alfred Langford, a chairmaker, who afterwards attained distinction as a journalist and as the historian of Birmingham. But "The Literature of Working Men," as these monthly supplements were styled, caused something of a sensation and excited the interest of Cobden and other friends of education. It was an English parallel to the "Lowell Offering," and all the more remarkable because the average of popular education was lower in Great Britain than in the United States.

In this *Working Man's Friend* appeared the series of illustrated articles which, after much recasting, omission, and revision, became Godkin's "History of Hungary." There are similar series on "China and the Chinese," on "Egypt, its Edifices and Its People," "The Holy Land," "Spain and Its People," and "Russia and the Russians," which have much the same characteristics as the Hungarian series. They are frankly compilations, but the dry facts are from time to time illuminated by comment, which, if it has the "profundity of youth," has also its strength and sympathy. When the *Working Man's Friend* ceased to be published, its place was taken by the *Popular Educator* and by the *Illustrated Magazine of Art*. The curious in such matters may see in this first magazine issued by John Cassell the germ of most of the departments of literature in which the firm he founded afterwards became so important. He died at the early age of forty-eight in 1865.

The *Working Man's Friend*, with its supplements, makes nine duodecimo and three quarto volumes. Once only do we find the name of Edwin L. Godwin, and that is as the author of a sketch entitled "A Christmas in Rathnagru" (December 25, 1852, p. 197). This is a weird story of a college duel and of the visitations of the banshee to a country house. It is sufficient to show that Godkin might have done something notable in fiction if he had cultivated imaginative literature. This latent talent for story-telling remained undeveloped.

PROFESSOR BUGGE.

To the Editor of The Nation:

Sir: The death of Prof. Sophus Bugge of Christiania is not only a loss to Norwegian scholarship and Germanic philology, but constitutes for many students of this branch of learning a distinctly personal bereavement. You will, therefore, perhaps allow one who during his student days enjoyed the good fortune of having Professor Bugge for his *privatpraeceptor*, to add a few remarks of a more personal nature to your announcement of this scholar's death.

Professor Bugge's attainments may be said to be a matter of common fame, having been recognized by learned institutions the world over; but when it comes to an appreciation of Bugge's character and influence, mention must be made, first of all, of that beauty of temper, that all-permeating kindliness of heart, which made out of every pupil, out of every one with whom he came into personal contact, a friend and lifelong admirer. Those who had the opportunity to study under Bugge—to listen to his lectures on the Eddas, on Runic Inscriptions, Sanscrit, Gothic, etc.—will ever cherish the picture of this teacher with the great head that seemed so weighted down by thought and study that it was always rocking in one direction or another, with the large, kindly, veiled eyes, almost hidden behind a pair of horn-rimmed spectacles, and they will consider it one of their life assets—as does the present writer—that they have sat at the feet of this Gamaliel. Bugge's teaching was scholarly and scientific to a degree, and he knew how to instill into his listeners his own spirit of scientific courage combined with modesty and reserve; and even if he could not transfer to them his own gift of intuition in emendation and interpretation, they could not but be helped and inspired by the presence of genius. The present writer knows of only one academic teacher who in the matter of inspiring students could be compared with Bugge, namely, Prof. Eduard Sievers of Leipzig; there may be others, but Bugge will always be classed in the front rank.

Bugge's lasting contribution to science will, no doubt, have to be sought as much in that almost innumerable series of monographs which are found scattered in learned magazines in many languages and countries, and relating to the several branches of philological research, and in the many suggestions which with lavish hand he contributed to the works of others, as in his own numerous independent publications.

Among these latter his edition of the Eddic poems—whereof Vigfusson rightly remarks that Bugge has thrown "light on many obscure places by the happy and *certain* emandations which by some gift of divination he had the secret of making"—will always maintain a high position. His last important work, the publication of the Norwegian Runic Inscriptions, was commenced in 1891, and its first volume, in six parts, completed in 1903. The second part of the second volume has been, since 1904, announced as "in the press"; it can, therefore, confidently be hoped that this thesaurus was completed by Bugge's own hand before his death. His "Studies on the Origin of the old Scandinavian Mythical and Heroic Tales" have, on the other hand, proved more fruitful in suggestions and discussions than in establishing any certain results. That Bugge was right in the main

principle, there can be little doubt, but the details are still *sub judice*.

Linked, as he was, by ties of the most intimate friendship, to scholars in all the Scandinavian countries, Bugge could not help being distressed by the growing enmity between Swedes and Norwegians during the latter years of the Scandinavian Union, and he did all in his power to promote friendship between the peoples. Thus when some years ago, his pupils and friends subscribed a fund to perpetuate Bugge's name at the Christiania University, he decided that the money should be employed as an endowment for scholarships for Norwegian students at Danish and Swedish universities; and he was one of the prime movers in the establishment of an exchange of professors between the Scandinavian universities, by which Swedish professors have been giving a series of lectures in Christiania and Copenhagen, Danish in Norway and Sweden, Norwegian in Sweden and Denmark. He hoped greatly that in this way the Scandinavian, peoples, and particularly the student class, might come to a better mutual understanding. Nevertheless, Bugge appreciated the necessity of the rupture, and was a loyal adherent of the new order of things.

To Bugge is truly applicable that saying of the old Norwegian sage and poet: "Chattels die, kinsmen die, one's self dies, the same; but the report of good fame never dies for whoever attains it." Or, as Euripides says:

Πολλῶν δακρύων ἔσται πίτυλος· τῶν γὰρ μεγάλων ἀξιοπενθεῖς φῆμαι μᾶλλον κατέχουσι.

P. GROTH.

New York, July 9.

PROFESSOR MÜNSTERBERG AND THE IDAHO TRIAL.

TO THE EDITOR OF THE NATION:

SIR: When I returned two weeks ago from Boisé to Boston, the newspapers circulated a few remarks which I made concerning Harry Orchard's subjective truthfulness. The reaction followed immediately. At first I was blamed for trying to influence the court and the jury. As next step came the inevitable: some lawyers of the defence told the world, and the Socialistic papers echoed it, that the whole thing is graft. I had been the "guest" of the prosecution and had simply been "paid" to spread interviews favorable for Orchard. And, finally, in the last week, the serious papers began to show that "modern psychology" has made a failure, as my interviews contained, after all, only observations which any one might make without eight hours of psychological experimenting, and that the time of my trip thus seems wasted. The opinion, "seriously entertained by intelligent Bostonians," that there exist psychological methods of examining the "truth-telling powers" of a witness seems thus exposed to deserved ridicule. As long as the criticism referred to me personally, I kept silent, with the intention to wait till the trial is over, but since it turns now against "psychology," I feel obliged to break my silence.

As to my short remarks about Orchard's truthfulness before the end of the trial, I plead these extenuating circumstances. First, I absolutely refused to speak a word for publication in Boisé; all the interviews which I discovered later in Eastern papers were written without my humble coöperation. Secondly, my remark that Orchard believes now what he says came out in the following way: I had been four days and nights in the hot sleeper, reached Boston late, overfatigued, and had still half an hour's trip in the accommodation train from Boston to Clifton. In this half-hour I found at my side a gentleman who told me that his paper wanted a few words concerning Orchard, and that he did not wish to trouble me at the station, but he thought I might have time for it in the train, which he had boarded for that purpose. I refused at first everything, but as I had to sit with him half an hour, we entered into conversation, and I acknowledged finally that in my opinion Orchard's confession is substantially reliable. I was overtired, and did not think at all of the possibility that such remark would go beyond the Boston morning paper. Of course, the next morning, when it was out, and was wired over the land, I could not avoid explaining to a new interviewer in a few words the way in which I had reached that opinion. That was all. I may add, thirdly, that I knew, of course, that my inquiries could not come into the court room in any form, and that the jury had no chance to read a line about the case in the papers; the idea of influencing the trial is thus not in question.

As to the hint that I was the "guest" of the prosecution or that I was "paid" by some one for these extracted interviews I do not think it necessary to answer or to defend myself. But in justice to all concerned I want to say emphatically that no one at any stage of my investigations or before or after dared even to suggest to me that I—with or without pay—ought to find material in favor of Orchard. On the contrary, every one respected the complete objectivity of my methods, and every one knew that I had a strictly scientific and not a legal, still less a commercial, interest in the case. The fact is that on the first day after seeing Orchard on the witness stand all my personal antipathy went to him and my sympathy to Haywood, and stayed there till to-day, but my psychological studies had nothing to do with such feelings.

Now, as to these studies: am I really to blame that I have abstained from any report of my observations and experiments? As soon as the trial is over I shall report in scientific archives what I have found, and, as public interest is awake and as the value of experimental psychology for the court room deserves full discussion, I shall try to sketch at least some of the methods and results also in popular form. To-day I cannot do anything but beg serious readers not to judge the methods of psychology from accounts which do not give the slightest idea of the real experiments involved. If I had really drawn my conclusions as to Orchard's reliability from those superficial impressions which the papers reported, I should feel morally obliged to resign the chair of psychology in Harvard University. I may say at least to-day that the chief proof lies for me in certain results of the time measurement of associations, a complex method which has been developed for legal purposes in the last two or three years. To deny that the experimental psychologist has indeed possibilities of determining the "truth-telling powers" is just as absurd as to deny that the chemical expert can find out whether there is arsenic in a stomach or whether blood spots are of human or of animal origin. I shall show my methods in all detail, and beg only that the newspaper trial against experimental psychology be postponed till the trial against Haywood is ended.

HUGO MÜNSTERBERG.

Clifton, Mass., July 12.

Notes.

The next volume of the Highways and Byways Series, to be published by Macmillan in the autumn, will take up Kent, Walter Jerrold writing the text and Hugh Thomson doing the illustrations.

Two more volumes have been added to the Dent-Putnam Classiques Français: Montesquieu's "Lettres Persanes," with Preface by Émile Faguet, and "Contes Choisis" of Voltaire, with Preface by Gustave Lanson.

Thomas Y. Crowell & Co. announce a New Handy Information Series, with such titles as "How to Play Golf," "How to Play Chess," "Handy Book of Card Games," "Handy Book of Synonyms," and "How to Keep Well."

Henry Frowde is reprinting, from the Proceedings of the British Academy, Prof. William Ridgeway's paper on "The Date of the First Shaping of the Cuchulainn Saga."

John W. Luce & Co. have arranged to bring out in the autumn an American edition of Agnes Tobin's "On the Death of Madonna Laura," which was reviewed in the *Nation* last week.

Among the autumn announcements of L. C. Page & Co. are: "Castles and Chateaux of Old Navarre," by Francis Miltoun; "Castles and Keeps of Scotland," by F. R. Fraprie; "Turkey and the Turks," by W. S. Monroe; "Umbrian Cities of Italy," by J. W. & A. M. Cruickshank; "A Woman's Journey Through the Philippines," by Florence Kimball Russell; "Mexico and Her People To-day," by Nevin O. Winter, and "Old New England Inns," by Mary Caroline Crawford.

D. H. Bates's memories of "Lincoln in the Telegraph Office" will be published in book form by the Century Company this autumn.

The Mayor of Lichfield makes an appeal for money to restore the house in which Samuel Johnson was born, and which since 1901 has been a public museum and memorial of the illustrious moralist. The building, unfortunately, has for lack of funds fallen into a state of dangerous decay.

A hitherto unknown work of Gobineau has been discovered by Prof. W. Schemann of Freiburg, i. B., and is to be published in the near future under the title of "La troisième République Française et ce qu'elle veut," the chief purpose of the book being to lay bare and warn against the dangers of intellectual centralization in France. In general the book gives an interesting picture of the intellectual life under the third republic, the most attractive chapter being perhaps that on Napoleon III. and his ef-

forts, exerted in vain, to combat the growing power of the bureaucracy.

The Garibaldi centenary should be useful in gathering indications of genuine experiences written out at the time. The dozen South American years have so far been totally neglected. For the Expedition of the Thousand, France has, besides Marc Monnier's newspaper correspondence, Dumas *père's* "Garibaldiens," Ulric de Fonvielle's letters, with Edouard Lockroy's drawings, in *Le Monde Illustré*, and Maxime Du Camp—all of the Thousand. Lockroy is still an active member of Parliament. Gen. Türr, the hero's *alter ego*, is still able if he wishes, to write the most desirable of memoirs.

The interest excited in the memoirs which were pretty certainly left by the late Count Nigra, but which for obvious reasons may not be given to the public for a long time, should not lead to forgetfulness of the valuable literary work connected with his career and published during his lifetime. His historical importance is due to the fact that he was the disciple, bosom friend, diplomatic agent, and international representative of Cavour, whose work he was charged with continuing. There is no one left in Europe, not even the venerable Visconti-Venosta, who has had the same experience in length of time and European extent of the men who transformed the Continent after 1848. Emperor Francis Joseph, it is true, still remains, but he was limited to his post, and is not likely to write memoirs. What could be told discreetly Count Nigra published during his lifetime in his "Ricordi Diplomatici"—personal impressions of a vanished world. The letters written to himself by the Comtesse de Circourt, and those of Cavour to that lady of the historic Salon, are of the highest value to all who wish to know something of the inside of history. Folk-lorists will remember his "Popular Songs of Piedmont"; and Italians may still pride themselves on his translation of the Greek Hymns of Callimachus. It was Massimo d'Azeglio who counselled him to cultivate poetry as a relief from statesmanship, pointing to his own example in painting. But at that time it was also thought that the training in statesmanship included a knowledge of the world of the past as well as that of the present.

The conferring the honorary degree of LL.D. on the King of Siam by the University of Cambridge during his recent visit to England, was not a tribute to mere royalty, but to the man himself. He is the first sovereign of Siam, to quote from Dr. Sandys, the public orator of the occasion, who had set before him, as the law of his existence, that it was the duty of a king to live, not for himself alone, but for the good of his people. He had no sooner ascended the throne than he became the foster-father, the preserver and defender, the liberator and educator of his people. His zeal for education was shown by the fact that not a few of the royal princes had been sent to Harrow and other great schools, and to both Oxford and Cambridge. Among his gifts to the university library were thirty-nine volumes of the Sacred Books of Siam, and the success of the Cambridge Ethnological Expedition of 1899 was largely owing to his Majesty's hospitality and generosity.

The serious problem of the unemployed in England is being solved by the National Institution of Apprenticeship. The majority of the unemployed, said Lord Avebury in an address at a meeting held on June 28, in the Mansion House, and presided over by the Lord Mayor, "were so because they were unskilled laborers," and their great number was largely due to the diminution of apprenticeships. Accordingly, the institution was founded in 1905, "in order that boys and girls should start life with the advantage not only of a liberal education and training given in the schools, but also with a practical training which was to be had in the workshop." Since its work began, over 200, mostly boys, have been apprenticed, and applicants for places now exceed forty per week. On the registers of the institution there are the names of more than 400 carefully selected masters, many of them ranking among the most important in their respective trades, who have taken, or agreed to take, apprentices from the institution. The only qualifications required of an applicant are his or her respectability and fitness for the selected trade. No question of religion or party politics is asked. It lends money for premiums when necessary, and supervises the apprenticeships so as to ensure as far as practicable that the apprentices are properly taught their trades and do their duty to their masters.

In France, where this kind of research is particularly cultivated, a third prehistoric congress is to be held between the 13th and the 18th of August in Autun, Burgundy, under the auspices of the Société Préhistorique de France. The first congress of this kind was held in Périgueux, in 1903, and the second in Vannes, in 1906. Autun is the classical Augustodunum, which under Augustus took the place of the ancient Bibracte, described by Cæsar and Strabo as the oldest and most important town in Gallia Lugdunensis. It is to-day the chief site for prehistoric research in France, especially in regard to military camps and fortifications, which is to be the leading theme of the coming congress. The museums and antiquities of Autun will be carefully studied by the members of the congress, and a three days' excursion to important archæological sites in the neighborhood constitutes a part of the programme.

The committee of the New York Library Association on library institutes reports that the plan first adopted last year, of dividing the libraries of the State into numerous small groups and holding a single day's meeting at the centre of each of these groups, has proved an even more decided success this year than last. In all, twenty-eight meetings were held, at which the number of libraries represented ranged from two to eighteen, and the attendance from six to thirty-five. The average representation was seven libraries and sixteen persons at each meeting. The total attendance for all the meetings numbered 453 persons, representing 207 libraries. These figures show a gain of thirteen libraries and fifty-one persons over the attendance last year, and a gain of more than 100 per cent. over the attendance under the old plan of two years ago. At each meeting, the problems to be discussed were selected by the librarians of the group from a list of twenty-five submitted by the committee. The topics chosen, in the order of their popularity, were as follows: "Book-selection," discussed at seventeen meetings; "Where to Buy Books and How," at thirteen; "Reference Books Most Used," at eleven; "Recent Books," at eight; "Mending Books," at eight; "Liberality to Borrowers," at six; "Fines and Penalties," at six; "Use of Magazines," at six. Fourteen other topics found a place on the programme of one or more meetings. Three topics contained in the list submitted by the committee proved to be of so little interest that they failed to find a place on any programme. These were "Branch Libraries," "Hours of Opening," and the "Accession Book."

The *Frankfurter Zeitung* reports that the educational authorities of the Province of Brandenburg, to which Berlin belongs, have entered into an agreement with a number of English and French educational boards for the purpose of exchanging graduates of the female normal colleges of these three countries. Last year a number of young French women teachers received temporary appointments in Germany with satisfactory results; and the aim of the new negotiations has been to extend this scheme of international exchange in higher educational work. It will be remembered that during the past few years a number of gymnasium teachers in institutions along the French and German borders have been employed as instructors in the practical acquisition of their own tongue in the schools across the national lines.

"Outdoors," by Ernest McGaffey (Scribners), is a reprint in book form of about thirty nature sketches contributed originally to the Chicago *Record*. Papers on various forms of shooting and fishing alternate quite regularly with such bloodless subjects as "Under a Greenwood Tree," "A Northern Nightingale," "In Dim October," and "The Bare, Brown Fields." Mr. McGaffey has the true instinct for outdoor life, but the chapter on "Hunting with Ferrets" betrays a bad flaw in its development. The ferret belongs to the pot-hunter, and any attempt to introduce it into higher society is to be resented.

The Rev. Dr. Allan Pollok, for many years connected with the Presbyterian College of Halifax, Nova Scotia, and now honorary principal of that institution, has embodied in a volume entitled "Studies in Practical Theology" his counsels on the personal life and public duties of the ministry, as they have shaped themselves in the instruction of several generations of theological students (Edinburgh: William Blackwood & Sons). While the subject of preaching and pulpit preparation is not neglected, much more space is devoted to such topics as the clergyman's life as a student, the conduct of public worship, the administration of the Church and the visitation of the sick, than is usual in homiletical treatises. The best traditions of the Scottish ministry, among which are scholarly industry, personal dignity, unfailing courtesy, and above all things, fidelity and conscientiousness, find a kindly and gentle exponent in Principal Pollok. While it is doubtless true that lectures on pastoral theology never produced a good clergyman, he may be deemed a most unusual minister who finds none of Principal Pollok's pages profitable for correction.

While Prof. A. L. Hickman's "Geographisch-Statistischer Universal-Taschen-Atlas" (G. Freytag & Berndt, Wien und Leipzig) may not supply a "long-felt want," it does furnish a desirable convenience. This little book, 7″x4″x0.75″, is nothing more nor less than a sort of geographical encyclopædia. Besides the maps, sufficiently clear and numerous for ordinary purposes, it contains a mass of political, commercial, politico-economic, etc., data. For example, the "Tables of All the States of the Earth" give in alphabetical order for each continent the name and form of government of each state, the name of the ruler and of his heir, the area, population and density of the capital and other important cities, with their populations, the money system, and the chief products of manufacture and tillage. Especially numerous are the diagrams, in colors, comparing, for example, population of countries and cities, religions, and all the other elements dear to the heart of the statistician. The gold and silver money of each nation of the world is represented in full size. We are obliged to note that in the matter of maps the Americas are not so well treated as Europe. But this apart, the book is one to be kept within reach, for nothing but a turn of the hand is required in its consultation.

Oscar Browning is at pains to inform us in the preface to "The Fall of Napoleon" (John Lane Co.) that his book is intended as a "personal history" of the Emperor during the period 1813-1815; but it must not be inferred from this that he has turned over a new leaf and taken to psychological history after the manner of Lamprecht, or, let us say, Nordau. Far from it; there is nothing in this book of psychology, or of historical research, in the strict sense, or of literary grace in any sense, but only two familiar, if dissimilar, facts, Napoleon and Mr. Browning. His volume is, in fact, a general history of three years of Napoleon's career and shows no very distinctive merit, save that it is not marred by the extreme carelessness of his last book on the same subject. The author is a mild apologist of Napoleon, and has taken Albert Sorel as his chief guide. Of the French historian he says, "his great work on Europe and the French Revolution places him as an historian only second to Taine," a sentiment which many will not echo.

Another aspect of the history of the great Corsican is that dealt with by W. H. P. Phyfe in his "Napoleon, the Return from St. Helena" (Putnams). The book is slight, contains more blank than printed pages, and sets forth the well-known circumstances of the transfer of Napoleon's ashes from St. Helena. There is also a description of the tomb in which he now reposes.

Houghton, Mifflin & Co. have issued at the Riverside Press a special edition of "The Poems of Maria Lowell," which leaves nothing to be desired in the *simplex munditiis* now aimed at by the best bookmakers in place of the illegible elegancies of the school of William Morris. Maria Lowell was, it need scarcely be said, the first wife of J. R. Lowell, a New England woman of fine spirit and culture. After her early death, in 1853, her husband had a small edition of her poems printed to be distributed among his friends. Before his own death he had in mind to reissue the little volume with various additions; but the project was never carried out, and the present reprint adheres to the original contents. The poems are amateurish in part, with the peculiar thinness of temperament or the spirituality, one scarcely knows which to call it, that marks the lesser New England literature. But it has its distinct charm, and here and there a very genuine beauty, as in this sonnet, which we may transcribe:

In the deep flushing of the Western sky,
The new moon stands as she would fain be gone,
And, dropping earthward, greet Endymion:
If Death uplift me, even thus should I,
Companioned by the silver spirits high
And stationed on the sunset's crimson towers,
Bend longing over earth's broad stretch of bowers,
To where my love beneath their shades might lie;
For I should weary of the endless blue,
Should weary of my ever-growing light,
If that one soul, so beautiful and true,
Were hidden by earth's vapors from my sight,
Should wane and wane as changeful planets do,
And move on slowly, wrapt in my own night.

OFFICIAL PRAGMATISM.

Pragmatism. Popular Lectures on Philosophy. By William James. New York: Longmans, Green & Co. $1.25 net.

In these lectures delivered at the Lowell Institute and at Columbia University, Professor James presents informally the theory of Pragmatism, which he has adopted, even if he did not devise it. The subject is one well suited to popular treatment, for the pragmatic position is essentially that of the average man, of the man in the street. Furthermore, Professor James has an unconventional way of dealing with philosophical questions, so that by graphic illustration and by simple language he attracts attention and wins assent. He observes that Pragmatism is not a new, but an old, way of thinking. It is indeed as old as Aristophanes, who shows Strepsiades, in the "Clouds," opposing his pragmatic views to the philosophy of Socrates. For the explanation and defence of Pragmatism given by Professor James is simply a quasi-philosophical apology for practical as opposed to philosophical thinking, and *Unphilosophie* has always been applauded by the crowd.

We find in these lectures all the old objections and criticisms which the "plain man" has always made to scientific philosophy. Professor James states these cleverly, and makes the most—as superficial writers have always done—of the inability of philosophers to answer their own questions. He borrows Schopenhauer's sneer at the "professional philosophers," and says that he turns away from "abstraction and insufficiency" towards "concreteness and adequacy, towards facts, towards action, and towards power," being apparently oblivious of the difficulties which lurk in such abstractions as action and power. The "empiricist temper" must be "regnant," and rationalism must be given up, that is, we must be content with skepticism in theory, and with non-rational practice. We are left in doubt, even after Professor James has explained in the simplest language his interesting opinions, what these value-judgments are worth which determine what is true. He says:

The Schiller-Dewey view of truth has been so ferociously attacked by rationalistic philosophers, and so abominably misunderstood, that here, if anywhere, is the point where a clear and simple statement should be made.

About this there can be no question, for Pragmatism stands or falls with its criterium of truth, and with its method of determining how that criterium is justified. Now, what is the "clear and simple statement" made by the author? First, he gets involved in the mere definition of truth, which he says means agreement with reality; for we must determine what is true before we reach reality. Secondly, he speaks of the truth of ideas, which, as a matter of fact, are neither true nor false; and, thirdly, he says that the truth of an idea is not a stagnant property inherent in it, which no sane modern philosopher ever supposed it was. "Truth happens to an idea. It *becomes* true, is *made* true by events." "The true, to put it very briefly, is only the expedient in the way of our thinking, just as the right is only the expedient in the way of our behaving." And again he says: "Grant an idea or belief to be true, what concrete difference will its being true make in any one's actual life?" Now, assuming that truth is not, but is made, how shall we recognize it after events have made it? If it be said, "by its expediency," we must then ask how is expediency determined, and is it true that expediency determines truth? The problem must be solved intellectually. Possibly this is why the lecturer says that the third stage in the career of Pragmatism is where its adversaries assert that they have discovered the theory; for if the theory is to be vindicated it must be by the intellectualist's, not by the pragmatist's method. One is reminded of the identification by Cudworth of morality with the "eternal fitness of things," without an explanation of what makes a thing fit. Professor James declares that it is the same thing to say that an idea is useful because it is true, and to say that it is true because it is useful. But in that case why distinguish the two terms? If they are indistinguishable, either proposition is tautologous and meaningless.

It would be easy to show how this method breaks down when any philosophical problem comes up for solution. A few instances will suffice. Pragmatism, we are told, has no dogmas, because it looks away from "first things, principles, categories, supposed necessities," and looks towards "last things, fruits, consequences, facts"; yet only a page earlier, five mutually exclusive "last things," "consequences," are presented, and their reconciliation arrived at by a principle beside which even the Hegelian dialectic seems childlike and transparent. For, says the Pragmatist, however contradictory to your way of thinking mine may be, if each has a value, each is a true way of thinking. To illustrate: In one room an atheist is scoffing, in another a Christian is praying. If it does not "matter" to the atheist that there is no God, or to the theist that there is one, then why should the rationalist intrude upon the dispute? Both atheist and theist believe what is expedient to each, and so the belief of each must be true. Such a reduction to the absurd of the ancient Protagorean indifferentism is a further proof that the essential fault of Pragmatism is in its test of truth. At bottom the error lies in a kind of intellectual laziness or shiftlessness, a desire to shuffle off the responsibility of the mind. It is the scholastic sister of

artistic impressionism and moral opportunism.

To take another case, there is the controversy about free-will which Professor James approaches as if he intended to discuss it seriously, but leaves with a few irrelevant remarks, of which the following is a sample: "Free-will pragmatically means *novelties in the world*, the right to expect that in its deepest elements, as well as in its surface phenomena, the future may not identically imitate the past." The same might be said with equal truth of any physical effect. But even if it could not, how could such a proposition as that just quoted be proved pragmatically?

It seems hardly requisite to look further at this form of opinion. It does very well for the average practical man, to whom little matters except the events which occur within touch of his right hand. But to call this superficial empiricism philosophy is like confusing truth and value.

CURRENT FICTION.

The Militants. By Mary Shipman Raymond Andrews. New York: Charles Scribner's Sons.

Mrs. Andrews is an accomplished story-teller, writing at times with a rhythm and dignity which place her quite above the average. The material of her stories, however, is of most unequal merit, and a slightly defective sense of structure often makes for a too obvious ending. Out of the present volume, "The Militants," more than one story arrests attention, not only for the manner, but for an unusual quality of simple, old-fashioned piety. "The Messenger" even touches upon the supernatural without the flatness commonly attending such risky ventures. The colonel sends out Lieut. Morgan to warn Captain Thornton that Black Wolf has taken the war path. Morgan's companion is delayed by a lame horse, and the young lieutenant rides on alone after nightfall towards the Black Wind mountains. The whole episode is too delicately told to deserve the ignominy of a second-hand narration. Suffice to say that the young soldier is helped by an angelic presence in such a way that neither hero, author nor reader is made in the least ridiculous. This miracle is brought about by two things: Mrs. Andrews's evident sincerity (a single mindedness so complete that to her Indians are as "cruel and filthy" as if no Indian Rights Association had ever undertaken to civilize the white man), and the really lofty key which she sustains throughout.

Like "The Messenger," "The Bishop's Silence" and "The Witnesses" are profoundly religious. Mrs. Andrews is no questioner; apparently a devout churchwoman, she looks out upon the world with sturdy belief. With the pen of to-day, she has rather the mind of a generation ago. In "The Aide-de-Camp," she merely writes an animated love story of the civil war, not quite keeping the pace till the end. The rest of the volume is composed of mediocre, romantic stories of the most conventional pattern. In these the lovely Southern heroine has it all her own way. "Sweet and crisp in the white that Southern girls wear most," she wins the eligible suitor in a variety of settings, by dint of her creamy complexion (one wonders—is it ever cream of tartar?), erratic syntax and conviction of being adorable. In fact to Mrs. Andrews's own personality is due whatever tolerance can be bestowed upon such threadbare tales as "The Little Revenge," "The Governor's Wife," and "The Ivory Gates." Nevertheless, if these be below the mark, on the other hand, it is not often that the magazine story contains such a finely emotional passage as the following:

That the other world of our hope rests on no distant, shining star, but lies about us as an atmosphere, unseen yet near, is the belief of many. The veil of material life shades earthly eyes, they say, from the glories in which we ever are. But sometimes when the veil wears thin in mortal stress, or is caught away by a rushing mighty wind of inspiration, the trembling human soul, so bared, so purified, may look down unimagined heavenly vistas, and messengers may steal across the shifting boundary, breathing hope and the air of a brighter world. And of him who speaks his vision, men say. "He is mad," or "He has dreamed."

The Fortuna Filly. By Howel Scratton. Boston: John W. Luce & Co.

Food, drink, and horse are the delightful ingredients of this innocent idyl. What cheerful stripling in what rosy hour hath contrived this enchantment? One refuses to admit that it may be a work of elderly art. No person who had ever been reduced to the sense of a digestion, a morning headache, or a code of social morals, could have achieved so light-hearted a record of impossible things. The plot alone is worth the price of the book, whatever that may be. An English baronet, a great furnisher and follower of the turf, though he never bets, has a fair daughter, who has a lover, who is pecuniarily ineligible as a suitor. But the fair daughter has an inspiration in the nick of time, as the lover is almost on the point of departure, in despair, for South Africa—that last infirmary of noble minds. It occurs to her that they may as well make their fortunes by a little skilful plunging on the turf. No sooner said than done. With the aid of an old trainer, the lover's few paltry thousands are speedily transformed into a snug fortune, and everybody, including the baronet father, who seems rather to enjoy his rôle of dupe, is happy. Indeed, everybody is so invincibly good-natured, everybody has such a good time, that the only villain provided is a sorry enough scarecrow. He is not cheerful, but he is so obligingly inept as greatly to increase the general cheerfulness. And oh, the horsy talk, and the viands and beverages that go with it! . . . "A big racing filly, dark bay, with one white hind heel, a lean varmint head, if I may use a doggy simile to a horse, as others have done before me, beautiful shoulders, big hips, with great length from hip to hock, and great flat clean legs, with nice round hoofs." This is one of a score of horses described with caressing care. So are the meals, for that matter. Hungrily, course by course, we follow them from the ox-tail soup to the anchovy toast.

As for the race meetings, they are all youth and success and joy: "All was bright and gay and jolly. Ravishing dresses were everywhere, and the place was a whirl of lace and silk and lingerie, of tiny shoes and tempting ankles, of rosy cheeks and glancing eyes and coquetry and laughter."

Nor are touches of higher sentiment lacking. "Dearest," says the hero to the heroine, between bets, "that song makes me sad. It makes me feel what sordid, worldly creatures we are, struggling for fame and money. I should like to give up everything—my profession and that hateful betting—and live on what we have got, in a tiny cottage by the Cornish sea." But our heroine is made of sterner stuff: she holds him to his task, and he forgets the cottage with the song which painted it upon his sensitive fancy. The winning of the Cambridgeshire makes it possible for him to declare himself to the baronet, who remarks complaisantly, "It is not often that a young man wins the Cambridgeshire and a wife in the same day, but you can have her!"

Delia pressed her father's arm and said, "Thank you, dad!" After which the cheerful pair may be safely left to themselves.

Spirit Lake. By Arthur Heming. New York: The Macmillan Co.

Mr. Heming's method harks back to the good old days when writers ran with the hounds, and children's books were one-sided and bloodthirsty. His group of Algonquin Indians go out into the Northwest for a winter's shooting and snaring, to bring in furs to the Hudson Bay Company's trader. The author has decided to rejoice with the trapper rather than to agonize with the trapped. Consequently, there is much joyous adventure, with a spirited account of the ways of Indians on the trail, of the manner of chasing various kinds of game, and a capable presentation of the Indian's point of view in business dealings with white men. This is an excellent book for boys just emerging from the stage where they "play Indian," and not yet old enough to relish their Parkman.

Tippoo Tib. The Story of his Career in Central Africa. Narrated from his own accounts by Dr. Heinrich Brode and translated by H. Havelock. With a preface by Sir Charles Eliot, K.C.M.G. New York: Longmans, Green & Co.

This is a unique book. It is the story, told largely in his own words, of the adventurous career of an Arab, who, though a slave-hunter, contributed in no small measure to the civilization of East Africa. Born in Zanzibar about 1835, he was only eighteen years old when he led his first expedition into the interior for slaves and ivory. The profits of this trade in those times may be learned from the fact that on one occasion with beads costing three dollars he bought ivory which he sold for ten thousand dollars, to say nothing of what he got for the natives who brought it to the coast. During nearly forty years of a trader's life he made extensive journeys, and became Sultan of a large territory to the west of Lake Tanganyika, as well as Governor of the Stanley Falls District in the Congo Free State. In 1891 he returned to Zanzibar, and lived quietly there till his death in 1905. He wrote an account of his adventures in Swahili at the suggestion of Dr. H. Brode, an attaché of the German mission, who published the original text, together with a German translation, in the Proceedings of the Institute of Oriental Languages. The present work is substantially a reproduction of

this autobiography with much additional material, chiefly historical, to make the narrative clearer or to correct obscure and false statements. It is accordingly a valuable addition to the scanty records of East African history.

Tippoo Tib—whose real name was Hamed, this being a nickname, "blinker," given him on account of a tremulous twitching of his eyelids—unlike most of his countrymen, seems to have been especially attracted by Europeans. This may be due to the fact that in one of his early expeditions he found Dr. Livingstone, then on his last journey, in a village without supplies and at the mercy of the natives who were at war with the Arabs. He describes him as an old man who called himself David, supplied his immediate wants, and rescued him from his dangerous position. In Livingstone's "Last Journals" we find this record, "Hameed is certainly very anxious to secure my safety," besides much else concerning their intercourse during the few days they were together. The next traveller whom he was able to assist was Lieut. Cameron, the first man to cross the Dark Continent. Possibly the fact that he had come out to aid Livingstone attracted Tippoo Tib and led him to help the traveller materially on his way. Singularly enough, the German explorer Wissmann, the first to cross the continent from west to east, was obliged to ask his assistance in the interior, which Tippoo Tib readily granted, conducting him in safety to the coast.

But the European with whom he had most to do was Stanley. Their first meeting was at a town on the upper Congo in 1876, of which our hero gives an amusing account. Stanley showed him his repeating rifle, saying: "'With this gun you can fire fifteen shots at a time.' . . . Then I thought in my heart: 'He is lying. That is a rifle with one barrel, and the second thing there must be the ramrod. How can the bullets come one after another out of the one barrel?' And I told him in turn: 'On the Lomami is a bow on which you place twenty arrows, and when you shoot it off the whole twenty fly at once, and every arrow strikes a man.' Then he rose at once, went outside, and fired twelve shots." Stanley pictures him as a "tall, black-bearded man of negroid complexion, in the prime of life, straight and quick in his movements, a picture of energy and strength. He had a fine, intelligent face, with a nervous twitching of the eyes, and gleaming white, perfectly formed teeth." They became good friends, and Tippoo Tib accompanied him with a large number of armed men in his exploration of the Congo River for a considerable time. He was with Stanley also in his expedition for the rescue of Emin Pasha, being left by him at the edge of the great forest to provide carriers for the unfortunate rearguard. The accounts of the two in regard to the disasters which befell this force and their causes differ materially, and it is difficult now to determine which tells the truth.

During the closing years of his life he was the most interesting personage in Zanzibar, as well as an important member of the council. He had two great longings, neither of which was gratified: the one to make a pilgrimage to Mecca, the other to behold the magic land of Europe, of which he had heard so much from his friends, and of whose splendor he had a foretaste when with Stanley he touched at Cape Town. It was certainly a remarkable career, chiefly memorable for the services which he rendered to the four great explorers. But had he been less devoted to money getting, had he used his great ability as a leader to establish and extend his dominion, the whole history of East Africa might have been changed. Instead of being divided between Great Britain and Germany, it might have become a great Mohammedan empire ruled over by Sultan Hamed, alias Tippoo Tib.

William Thomas Arnold. By Mrs. Humphry Ward and C. E. Montague. Manchester: The University Press.

The unobtrusiveness with which this volume is issued is in curious harmony with the character of its subject. It is published not in London, but in a provincial city, it appears almost without advertising, and it bears an imprint which would suggest that it is of interest only to a narrow circle. Its place is on a shelf hitherto scantily furnished. There are few memoirs of journalists, and the section of journalistic biography which concerns itself with men who never occupied an editorial chair, but did practically their whole work as writers of leading articles, is especially small. Dr. Robertson Nicoll's biography of James Macdonell was indeed the only notable book of the kind until this life of William Arnold appeared. The fortunate collaboration of Mrs. Ward, Arnold's sister, and Mr. Montague, one of his journalistic colleagues and friends, has given us here a book of first-rate importance for all students of the history and influence of the press.

William Thomas Arnold was born in 1852 in Tasmania, where his father Thomas Arnold—second son of Arnold of Rugby—was chief inspector of schools. The family returned to England in 1856. The lad was sent to the Oratory School, Birmingham, his father being at that time a Roman Catholic, and afterwards to Rugby, where he became head of the school. He entered University College, Oxford, in 1871 and took his degree in 1875. The desultoriness of his reading prevented his gaining the examination honors which his great abilities had led his friends to expect, but in 1878 he amply retrieved this comparative failure by his success in the competition for the Arnold Essay Prize. He won it with a treatise on "Roman Provincial Administration," which has ever since been the chief English authority on the subject. After spending a short time as a private tutor, he was invited in 1879 to join the staff of the Manchester *Guardian*. He gave himself mainly to the service of that journal, until spinal trouble compelled him to retire in 1898. He removed to London, and contributed to his old paper and other publications, as far as his health would allow, until his death in June, 1904.

The main energy of his life was poured into his writing for the daily press. He had a high ideal of the functions and possibilities of his profession, and a great contempt for the "superior" contributor who sneers at journalism as such. He approved the saying that there is no limit to what a man can do, if he does not care who gains the credit for it, and added that for a man who wished to get things done, there was no work like journalism. He thus took anonymity seriously, and even with a kind of zest, "bearing himself to his paper," Mr. Montague tells us, "as a Jesuit to the Order." This attitude, however, was obviously conditional on the character of the newspaper to be served, which must not be a hoarding for the posters of a party or a mere reflection of public opinion, but an instrument of civilization. There must be "no uncritical assents, in politics, morals or criticism, to fashionable second-bests." Those who are familiar with the place the Manchester *Guardian* has held for many years in English journalism will understand that Arnold found in its employment ample scope for the exercise of his talent without the risk of parasitism or quackery.

At the beginning of his career Arnold saw that the journalist's necessity of making up his mind quickly on points of evidence required him to maintain the constant discipline of scholarly research, if he would be saved from superficiality. He must be able, at least, to bring an expert's methods to those subjects to which he could not bring an expert's knowledge. Arnold's historical studies not only safeguarded bim in this respect, but directly contributed to the sane judgment of contemporary politics. And in several subjects in which Arnold was not himself an expert he kept himself aware of what the experts were doing. When these experts met him, they were surprised to come upon what Mr. Montague happily calls "unexpected pockets" of special knowledge in Arnold's mind. M. Augustin Filon, for example, discovered that Arnold knew better than he the mass of French verse of Dryden's age, and other friends occupied on subjects far away from Roman history would hear from him of important foreign monographs which he feared they might otherwise overlook. The sudden emergence of a new topic found him well equipped with the material for its discussion. To the working journalist, one of the most interesting passages in this book is the account of Arnold's mass of cuttings, notes, and references "arranged in concentric circles about him; the most vital parts re-read and digested; the next in order of value merely indexed in his mind and kept ready to his hand by the help of some 378 spacious pigeon-holes, the outer ring of material, not preserved bodily, but kept within call by notes of its whereabouts, filed in the appropriate pigeon-hole."

It is clear that Arnold owed much of his effectiveness in journalism to his Oxford training, but one is rather surprised to find that he considered the Universities a poor school of style. Mr. Montague reports him as complaining that most Oxford Honors men seemed to need a year in a newspaper office "to unlearn their journalese." An appendix consisting of a few specimens of Arnold's leading articles would have been of assistance to us in estimating his own qualities as a writer. As it is, the few extracts, mainly from his letters, quoted here and there in the book, show a style deserving rather higher praise than Mr. Montague is inclined to give it. Mr. Montague himself evidently prefers a

more "exquisite" literary manner, but every one will not agree with him. With so much necessity of rapid writing it was no slight merit in Arnold's style that it should be so "fluffless"; that there should be "no inky humming and ha-ing, or clearing of the literary throat." We are told, too, that he had a keen sense of the moral value of words, recognizing how fanaticism is bred by the extravagance into which men are betrayed by their ignorance of the exactly-proportioned word, or by the laziness which prevents their taking the pains to find it.

There is much that could be said of Arnold's patriotism, of his social charm, of his generosity, of his sympathy with the sufferiug of others, and of his cheerful fortitude in his own. He lived his life on a high plane, and to the story of its altruistic devotion might fitly be applied, many of the lines written in Rugby Chapel by his distinguished uncle in memory of that Arnold in whose heart was no languor, and in whose word no weakness.

Poesie di Mille Autori intorno a Dante Alighieri Raccolte ed ordinate cronologicamente con note storiche, bibliografiche e biografiche da Carlo del Balzo. 12 volumes, 8vo. Rome: Forzani e Cia. 1889-1907.

Signor del Balzo is to be congratulated on completing a work which nobody would have advised him to undertake, but which, being done as successfully as he has done it, many readers will prize. More than twenty years ago he set about collecting whatever poets have said in any language about Dante. He begins with Guido Cavalcanti's sonnet of 1283,

Vedesti, al mio parere ogni valore,

which was a reply to Dante's own sonnet in the "Vita Nuova,"

A ciascun alma presa e gentil core;

he ends with Giuseppe Brambilla's canto, dated May 14, 1865, in honor of Dante's sixth centenary. In all, he prints 648 pieces, and his work comprises over 7,000 pages. We mention these figures, not because quantity should rank above quality, but because they show the compiler's range and thoroughness, tests of prime importance in an anthology of this kind. Anthology is hardly the right word; herbarium would be more exact, because Signor del Balzo, like the botanist sent to bring back specimens of the entire flora of a country, properly makes no distinction between flowers and weeds. We have noticed no omissions.

The reader who is assured, therefore, that the collectiou is exhaustive, may ask what purpose it serves. We would reply at once that it is much more than a literary curiosity. In the first place, it furnishes a remarkable criterion of the estimation in which Dante has beeu held from age to age. Next, it enables us to trace Dante's immediate influence for more than five hundred years on poets in Italy and other lands; for Signor del Balzo cites not merely the tributes to Dante, but the conscious imitations and paraphrases and indirect offspring of his poems. Again, it sets before us an almost unlimited means towards the comparative study of literature. We can pursue this study *vertically* (so to speak), that is, by taking the specimens in one language and examining them chronologically, or we can investigate *horizontally*, that is, by comparing the various authors, Italian and foreign, of a given period. As a quarry of linguistics the work has further value, because it contains scores of selections which, if sought in their original sources, could be found only in the largest library.

But in addition to the interest and value of the selections themselves, we have the editorial work of Signor del Balzo. This comprises not merely biographical informatiou and ordinary bibliographical references, but much critical matter, many sidelights, anecdotes, and recondite illustrations. The notes to Joannes de Virgilio's "Carmen" (i., 158-163), for instance, give a conspectus of philological comment. The compiler's own remarks are often well worth attention. The scope of this thesaurus can best be inferred when we state that it includes sonnets and short lyrics on the one hand, and several dramas on the other. Friedrich Notter's "Romanzen-Kranz" (xi., 263-477) fills 215 pages; and "Dante," a tragic drama in five acts, requires even more space for the original Danish text and the French version below it; and this is only one of several dramas printed entire. Half a score of languages are represented, including Italian and its dialects; French, English, Spanish, German, Danish, Hebrew, and Latin. The student of literary forms will find here material for an investigation of the art of writing eulogies in verse; the student of Italian history will not fail to perceive how one generation after another of Italians turned to Dante as the prophet of independence; the reader who has leisure for browsing will come upon many entertaining curiosities. Of the intrinsic poetic merit of the hundreds of selections critics will hardly agree; but a reviewer who can command only five or six of the languages in which these effusions are written may hazard, without audacity, the opinion that eulogies do not, in general, "make" for poetry. And it is not Anglo-Saxon bias that brings the verdict that the noblest tributes and the finest poems by foreigners in the entire collection are written in English. Indeed, who has matched Longfellow's sonnets except Michael Angelo himself?

The value of Signor del Balzo's monumental work will enhance with time, as it becomes more difficult to gather the many hundred volumes on which he has drawn—some of them, indeed, are already very rare; and it should have a place in every large public and college library. The Dante scholar and the specialist in comparative literature scarcely need to have it commended to them, so obvious are its merits and uses. The only defect we have to charge against it is the lack of a good index.

Signs and Portents in the Far East. By Everard Cotes. New York: G. P. Putnam's Sons. $2.50 net.

The Awakening of China. By W. A. P. Martin. New York: Doubleday, Page & Co. $3.80 net.

Nearly all the recent books on Japan and China are characterized by bulkiness and sameness. The first quality arises undoubtedly from purely mechanical considerations and the second follows from the first. After all, the events of the last two years in the Far East, that is since the conclusion of the Russo-Japanese war, have not been so many or of such startling nature as to be impossible of adequate treatment within a comparatively restricted number of pages. Mr. Cotes's volume, therefore, like others we remember reading, is made up largely of discussion and description such as we have grown accustomed to find in the newspapers and magazines. First there is a good deal of gazetteer and geographical information and this is followed by an account, quite adequate for the most part, of actualities and aspirations in the new China —reform, the building of railways, the creation of an army, the introduction of Western education, the missicnary problem, and exactly what Japan is going to do to China and the West. All the books speak of Yuan-shih-kai, and his progressive policy as viceroy of Chih-li, of Hankow and its steel mills and arsenal, of the Belgian railway which runs from Pekin to Hankow or from Hankow to Pekin in accordance with the traveller's point of departure, and of the results for the world at large when the huge stirring empire shall have thoroughly awakened. Mr. Martin's volume differs from the general type in that it deals for the greater part with the Chinese history of an earlier time, and only secondarily with present day movements; and with a mere reference to certain interesting chapters such as the one concerned with the Viceroy Chang as a type of the highest kind of Chinese statesman, and another which treats of the rôle of the European missionaries from the point of view of one who was a prominent worker in the field for over half a century, the volume may be dismissed.

On the whole, writers on conditions in the Far East all sin in the direction of undue optimism when it comes to speaking of the future of China. That a new age is dawning in the Celestial empire is not to be denied, but that the tremendous changes which most observers foresee will come about within our own days is seriously open to doubt. Obvious though the historic caution is that because Japan lies so near to China the latter must not necessarily follow in the footsteps of its neighbor, the implication is always present in our more or less highly colored accounts that what Japan has accomplished China, too, can, in the same speedy manner, attain. The Chinese, as we have said, are abandoning their antiquated educational system, studying Western culture and systems of government, and developing a spirit of patriotism which reveals itself in an active native press and a somewhat less active movement for taking the management of various industrial enterprises out of the hands of Europeans. Even the question of abolishing extra-territorial jurisdiction in the ports and the capital is discussed. But when we come to examine just what our authorities mean by Japan's achievements we find that it is not her industrial development, nor again her progress in the Western arts, that has impressed the imagination as much as her triumphs in the battlefield. So that really the regeneration of China resolves itself into the question whether the Middle Kingdom can ever become a first-rate military power. This has been plainly enough stated by Mr. Putnam Weale in his series of well-inform-

ed volumes dealing with the Far East.

Once the problem is reduced to this simple basis it becomes apparent that the example of Japan cannot greatly aid us in estimating the future of China. The Chinese may be better traders and artisans than the Japanese and possessed of a land far richer in natural resources. That is beside the question. The facts are that the Japanese by temperament and training have always been a fighting people, and the Chinese a pacific, almost an effeminate, nation. There is good fighting material, we are told, in the Chinaman, especially in the hardy inhabitant of the northern provinces. But it must take more than one generation to instil the militant spirit into a people whose genius is decidedly opposed to the practice of the soldierly virtues. To put it almost brutally a nation that still finds its highest type in the scholar and philosopher, not by word of mouth, as among us, but innately and sincerely, a nation which counts filial piety above every other virtue, including patriotism, must take more than a decade or two to develop into a fighting nation. Much praise has been lavished on Yuan-shih-kai's excellent army of 100,000 men; but there is no absolutely sure prospect that when Yuan-shih-kai passes away in the course of time or politics, that army will remain. The fortune of progress in China is still largely bound up with a few great personalities, and there is no firm guarantee against a period of reaction such as followed the outburst of reform activity during the last years of the nineteenth century.

A Critical and Exegetical Commentary on the Book of Psalms. By Charles Augustus Briggs and Emilie Grace Briggs. 2 vols. [International Critical Commentary.] New York: Charles Scribner's Sons. $6 net.

These volumes command respect as a work of immense industry. No existing commentary on the Psalms can be compared with them for exhaustive thoroughness. The interpretation presents the results of a lifetime's study, in the course of which every question of criticism and exegesis has been patiently and independently investigated, while the notes furnish a complete apparatus—critical, grammatical, lexical, historical. It is perhaps ungrateful to say that in the treatment of Hebrew words and phrases the author has done more than the duty of a commentator, and filled his pages with matter for which the student might properly have been referred to the excellent new Lexicon of which Professor Briggs is an editor.

The feature of the work which the author unquestionably regards as his most important original contribution to the understanding of the Psalter is the reconstruction of the text. Professor Briggs was one of the first American scholars to investigate the structure of Hebrew poetry, and he has had the gratification of seeing his views accepted, in essentials, by an increasing number of students. His theory, briefly set forth in the Introduction (vol. i., pp. xxxviii-xlviii), is, in substance, that Hebrew metre is a loose stress rhythm, a verse consisting of a certain number of emphatic syllables—usually from three to six—alternating with unemphatic syllables indefinite in number, quantity, and rhythmical relations; a certain number of such verses—from two up to twelve or fourteen—constitutes a stanza or "strophe." These criteria are applied in a thoroughgoing way to the Psalms. Having determined how many "tones" there should be in a line, and how many lines should go to a "strophe," the text is made to conform to the pattern.

This Procrustean criticism will provoke dissent from scholars of more conservative temper or of stricter philological training. The one established fact is that Hebrew poetry is accentual, not quantitative; but that nothing more is necessary to make accentual rhythm than a fixed number of stressed syllables in the line, is an obviously false proposition; and that Hebrew poets habitually counted their fingers with such monotonous regularity, and cut up their poems into uniform stanzas, like Watts in the hymn book, is an unfounded assumption. Such machine versification there may be in the Psalter—neither men, gods, nor booksellers have ever succeeded in suppressing machine poets—but that this is the characteristic of Hebrew poetry is a theory which cannot but evoke a protest from those who have an ear for its rhythm as well as a feeling for its spirit. The hesitation we have on methodical grounds is not diminished by closer observation of the results. Many of the emendations to which the author is led by "metrical" considerations commend themselves; but a far greater number are arbitrary and unnecessary. By way of compensation, when it is not a question of metrical regularity, Professor Briggs is surprisingly conservative, and defends the text in many passages which are generally regarded as corrupt.

In regard to the age of the psalms, also, he is conservative, attributing more than thirty psalms to the period of the monarchy. He assigns Psalms 74 and 79 to the Babylonian exile, and 83 and 44 to the Persian period, exscinding the unmistakable references to the persecution by Antiochus Epiphanes and to the national uprising as Maccabæan interpolations. To the Maccabæan times are ascribed Psalms 33, 102b, 109b, 118, 139c; no psalms of later date are recognized.

The author's critical reasoning is sometimes hard to follow, as when, for example, he argues that in Psalm 2, "The seat of dominion is Mount Zion, and therefore we cannot think . . . of a Greek king, such as Alexander Jannæus, or . . . of Aristobulus I." Why these Asmonæan rulers should be called "Greek kings" and in the next sentence distinguished from "Maccabæan princes," or where their residence was, if not on Mount Zion, does not appear. Like many other critics, Professor Briggs confidently connects particular psalms with historical persons and events upon the ground of allusions or parallels, which, if recognized at all as such, are capable of the most diverse interpretation. Thus, he discovers the royal bridegroom of Psalm 45 in Jehu (2 Kings 9-10):

Jehu was a well-known hero, anointed by a prophet of Yahweh . . . ; he was at once proclaimed by the army, showing his popularity and probable grace of form and speech; he rode forth in his chariot to meet the king and overthrow him; . . . he killed the king by piercing his heart with an arrow. He wrought fearful deeds upon Jezebel, the royal household, and the worshippers of Baal. . . . No more graphic description of the victorious ride of Jehu could be composed than vs. 4-6.

Professor Haupt, in the exercise of similar divinatory faculties, is convinced that the poem was written for the marriage of Alexander Balas with Cleopatra; while Duhm hits on Aristobulus I., and Kirkpatrick sticks to Solomon. The patent fact is that there is nothing in these praises of the prowess of the king and the beauty of his bride that might not have been sung by a court poet at the wedding of any monarch. Linguistic evidence may perhaps determine in a general way the age of the poem, but our curiosity about the names of the hero and heroine must remain unsatisfied.

In the Introduction the author presents the results of a laborious investigation of the older and smaller collections of poems—the Davidic Psalms, Psalms of Asaph, the Korahites, the Director's Book, etc., in their complicated relations to one another, and develops a theory of the successive stages in the compilation and editing of the Psalter. A discussion of this theory is not in place here; but the reviewer may be permitted to express a far-reaching doubt whether the evidence—chiefly in the titles and in musical or liturgical directions—is of a nature to sustain so detailed a reconstruction of the internal history of the Psalter. Other topics dealt with in the Introduction are the nature of Hebrew poetry; the history of interpretation, the account of which is somewhat meagre; and the Hebrew text and ancient versions of the Psalms. The treatment of the last subject is marred by many inaccuracies.

A word should be said in conclusion about the translations. They are meant to present connectedly a literal interpretation of the reconstructed text, without any attempt to preserve the poetical quality of the original. But they frequently exhibit a singular obtuseness to the effect of English words. The Hebrew *rinnah* may be, in the dictionary, a loud and strident cry; but "attend to my yell" (Psalm 17:1) produces on the English reader an incongruous, not to say ludicrous, impression which is wholly false to the original.

Nuovi Studii Danteschi (Ugolino, Pier della Vigna, I Simoniaci, e discussioni varie). By Francesco D'Ovidio. Milan: Ulrico Hoepli.

The three studies named in the title are new; the remainder, nine in number, appeared between 1879 ("L'Enfer del Littré") and 1904; the article on Littré's Old French version of the Inferno was printed originally in the *Nuova Antologia*, and Signor D'Ovidio had therefore some ground for doubting the advisability of having it reprinted; as to the rest, each came forth originally in some more or less inaccessible print, and there was ample warrant for republishing them all. Nearly every essay in the present book will be valuable to Dante scholars, and each may be read with interest by a still greater audience.

The study entitled "Ugolino" interprets that episode from seemingly every point of view likely to clarify its meaning and to prove that Dante handled his theme with an art bordering upon absolute perfection.

To "The Last Words of Ugolino" (Poscia, più che il dolor, potè il digiuno—to be translated, possibly, "then fasting had more power than grief") Signor D'Ovidio devotes 53 pages. He faces the problem thus:

The question must be only whether those bodies [of Ugolino's sons], at first fondly embraced, were at last more or less bitten through blind starving rage, with little or no physical effect, but with a great psychic effect; that is, in Ugolino's being shot through with the frightful thought of having set his teeth into his own sons, and in his wish to avenge himself down there [in hell] on the skull of him who was the cause of such an enormity.

Forty pages of argument lead our commentator to a fairly obvious conclusion which is not foreshadowed in his question:

When [Ugolino] says that at last even grief had to yield to starvation [inedia], what else can he mean but that he, too, fell? He, too, if Dante had been in such a daze as to ask him, "What did the fasting do?" would perhaps have reproached him with being hard of understanding, as he had already reproached him with being hard of heart.

The essay on "Il Canto di Pier della Vigna" is a comparative study of Dante and his classical sources, followed by a detailed interpretation of the canto. In a similar study of "Il Canto dei Simoniaci" Signor D'Ovidio describes accurately the baptismal font of San Giovanni as it was in Dante's time; and shows that Dante's scene of the Simoniacs, upside down in their pits, is derived from the very incident which the poet uses as an illustration to impart reality to that scene—a method constantly followed by Dante. To the puzzle as to what Dante meant by "il piè fermo," Signor D'Ovidio offers a satisfying answer on pp. 448 and 454.

The last study in the volume, though not new (it appeared some five years ago), is really the one of greatest importance; for it is a bold, luminous, and persuasive argument that the "Fiore" was composed by Dante. In 1901 Mazzoni put forward this idea as an hypothesis. This hypothesis D'Ovidio turns into a thesis. If his argument is not merely convincing, but so strong that no one can overthrow it, a gap in the darkest period of Dante's life, that period in which he forgot Beatrice and succumbed to the flesh, will have lost most of its mystery. The poet's relation to the mystic rose in Paradise and his debt to the "Roman de la rose" can then no longer be doubted; the profane rose of the "Fiore" will amply explain why Dante thus symbolizes his repentance of what must have been the bitterest memory of his past. If the Durante of the "Fiore" is the Dante who in the "Commedia" names himself but once, what Boccaccio says of his hero's having strayed from virtue will have been proved true; a whole epoch in the poet's life will have to be rewritten, and more than two hundred sonnets, revealing unmistakably a Dante who sinned like other men, and even dwelt in a jesting allegory upon all the stages through which he passed before arriving at his "rose," will have to be added to the poet's works, not, perhaps, as unquestionably authentic, but as being in all likelihood the creation of his pen. The manuscript of the "Fiore" is at Monpellier; it awaits a competent editor.

Science.

THE ANNIVERSARY OF ALDROVANDI.

BOLOGNA, June 14.

Many of the delegates from Europe and America who assembled in Bologna on June 11 as guests of the municipality, came with very indistinct notions as to the achievements of the man in whose honor they had been invited; but from the remarks of the chief speakers at the commemoration, and from an inspection of the reconstructed Aldrovandi Museum and of the numerous documents brought to light and published on this occasion, a clear impression results. It is a curious coincidence that the celebration should come in the same year with the centenaries of Linnæus and of Agassiz—scientists of whom Aldrovandi may fairly be said to be one of the important precursors. When he died at the age of eighty-three in 1605, he left by will all his books, specimens, manuscripts, and other materials to form a museum. These materials were scattered through various parts of the university, and some wandered as far as Paris; a few that were of a combustible nature helped, it is said, to feed the stoves of the lecture halls. Finally in 1905, when 300 years had passed, the authorities determined to carry out the provisions of the will, and at the same time to honor the memory of the distinguished man who had devoted practically all his time and fortune to the advancement of science and the glory of his native city. At a time when the influence of the Inquisition was deadly, and the standards of the university were at a low ebb, he was a powerful advocate of sound principles in science. Quite remarkable for the age was his rigid insistence on the necessity of observation. In the museum are shown in striking juxtaposition his original specimens, the drawings from them, the woodcuts made under his supervision, and the prints in his published works. These works fill a dozen large volumes, some of which were printed after his death with funds left by him for the purpose. His manuscripts crowd an extraordinary number of shelves; an index of them is published by the university in connection with the commemoration. The whole museum is sumptuously arranged in one of the fine halls of the university. At one end are displayed the documents of greeting, in some cases very artistic and elaborate, brought by the delegates from universities and learned societies. Probably no scientist would say that Aldrovandi's works are of great importance for consultation to-day; nevertheless, the museum marks an epoch in the development of modern scientific methods and knowledge. The botanic garden and the geological museum, also founded by Aldrovandi, contain valuable specimens; one, a fossil found in an Etruscan tomb, is said to be the oldest geological specimen known.

The date chosen for the celebration is that which was assumed for the birthday of the university at the time of the eighth centenary in 1888, namely, June 12. The honorary head of the committee which arranged the celebration was the syndic of Bologna, Marchese Tanari, who greeted the delegates at a reception in the town hall on the evening of the 11th, but the effective head was the distinguished geologist, Giovanni Capellini, professor and Senator, under whose supervision the arrangements were carried out without a hitch. He presided at the "solemn commemoration" on the 12th in the Archiginnasio, formerly the home of the university. After cordial addresses of welcome by the authorities of the city, the university, and the Italian Government, responses were made by some of the delegates, one speaking for each nation represented. The thanks of the Aldrovandi family were expressed in a very neat speech by Conte Aldrovandi, a descendant of the great naturalist, and now connected with the Italian Consulate in New York. Then followed a commemorative oration by Prof. Emilio Costa, who brought out particularly Aldrovandi's part in the history of Bologna. The occasion was a brilliant one. Most of the delegates wore academic costume, in some cases decidedly picturesque. Many students, wearing their historic "goliardic" caps of various colors, according to the faculty under which they studied, filled the back part of the hall.

Some of the results of the commemoration are permanent in character, especially the institution of the Aldrovandi museum and the publication of important documents, beginning a series which is to cover the history of the university. The rest of the programme arranged for the delegates was lighter in character, and included a visit to the admirably arranged and beautifully situated orthopedic institute, and a banquet at the Hotel Brun. Free access was granted to the museums and art galleries. The libraries of the university and the city were closed, but, nevertheless, through the courtesy of the librarians, who at the same time were busy as members of the committee, visitors were allowed to consult the rare books and manuscripts in which Bologna is rich. A fourteenth-century fragment of a bestiary, ascribing to various animals the traditional fanciful characteristics of such books, was obligingly brought to light by Dr. Ludovico Trati, the learned assistant librarian of the university; it showed vividly the sharp distinction between the natural science of the Middle Ages and that of Aldrovandi's age, the distance surely being greater and more significant than that between Aldrovandi and the scientists of to-day.

KENNETH MCKENZIE.

D. Van Nostrand & Co. have just issued "A Handbook of Wireless Telegraphy: Its Theory and Practice," by James Erskine-Murray; "The Construction of Dynamos," by Tyson Sewell; "Canning and Preserving of Food Products," by Edward W. Duckwall; "Agglutinants of All Kinds for All Purposes," by H. C. Standage, and "Ammonia and Its Compounds," by J. Grossmann.

The French minister of public instruction recently submitted to the Conseil Supérieur a proposed reform of the higher university degree—*licence ès lettres*. This suppressed not only all examination in Greek, but in Latin as well. The abandonment of Greek is allowed in the license for history, philosophy, and living languages, as a preparatory literary training already exists without Greek. But the university has so far no literary training without Latin; moreover, the minister's

proposition excluded the examination in Latin without prescribing any literary examination in French. This is described as, at least, frank in its modernity—a degree in letters without examination in literature. The Conseil accordingly refuses the reform and demands that the written examination in Latin shall be retained for the university *licence ès lettres* of whatever kind. On the other hand, the Conseil approves the minister's programme of physical education in primary and higher schools. The end of such education is twofold—"to give energy and to teach how to make the best use of energy." Hence the two great divisions of exercise: first, developing exercises which set up a healthy balance between physical and intellectual activity; second, exercises of application, "games and sports that make a man familiar with practices which he will have to apply in life." The general principle of all such exercises is that "they shall be within reach of the weak who have more need of improvement than others." The conclusion is significant of the times:

> The instructor should strive to obtain an average as high as possible from the whole collection of pupils under his care. All training that aims at making experts (*virtuoses*) out of the best endowed should be prohibited, for it could be given only to the detriment of the weak, who have the most need of improvement.

Sir William Henry Perkins, the English chemist, whose death in London was announced Sunday, was born in London in 1838, and received his early training at the City of London School. He studied chemistry under Dr. A. W. Hofman at the Royal College of Chemistry, and later became Hofman's assistant. In the course of his experiments he discovered a purple or mauve dye formed by the oxidation of aniline. This discovery, made by accident from materials which Sir William was about to throw away, proved to be the foundation of the aniline or coal-tar color industry, which gives employment in Germany to over 100,000 men. No less than 700 distinct tints are produced by the process. In 1906 the jubilee of the discovery was celebrated, and Sir William was entertained in this country. Johns Hopkins conferred the degree of LL.D. upon him. He was knighted shortly before coming to America. He retired from the manufacturing interests in 1874, and devoted himself to research. His writings were numerous, but appeared for the most part as contributions to the Transactions of the Chemical Society.

The death is announced of Emmanuel Mendel, the well-known nerve doctor, in his sixty-eighth year. He was professor of psychiatry in the University of Berlin, and author of various works in neurology.

Drama and Music.

A. W. Pinero and Bernard Fagan, the author of "The Prayer of the Sword," are both writing new plays for George Alexander.

Ben Greet and his players finished on Saturday night a two weeks' engagement at the University of Chicago. They began their present season in Florida on May 2, and the weather has been most unpropitious to their out-door representations. More than half of their performances have been given in theatres or halls. As a rule, the company has been very successful. Mr. Greet will fulfil a few engagements in the East before entering upon a summer vacation.

Henrietta Crosman's dramatic version of "The Pilgrim's Progress," called "The Christian Pilgrim," will begin its New York season in the Liberty Theatre on the 4th of November.

William J. Locke has prepared a dramatic version of his own novel, "The Beloved Vagabond," and Beerbohm Tree will produce it, in London. It was designed originally for Arthur Bourchier, but the latter abandoned all claim upon it, recognizing the fact that the central character would fit Mr. Tree more easily than it would himself.

C. G. Sonneck has a letter in the *Allgemeine Musik-Zeitung*, in which he vigorously combats the prevalent opinion that "Yankee Doodle" was brought to America by hired Hessian soldiers. He has in his possession a libretto, dated 1767, entitled "The Disappointment," the text of a ballad opera, the fourth number of which was sung to "Yankee Doodle." The Hessians may be grateful for having that stain wiped off their ancestors.

The copyright of "Tristan und Isolde" has just expired. It was first performed on June 10, 1865, at Munich. The only Wagner operas of which the copyrights have still to run are "Die Meistersinger," "Parsifal," and the four Nibelung dramas.

The new German periodical, *Morgen*, prints some previously unpublished letters of Wagner, in one of which he expresses his hope of finishing the "Ring" operas in 1855 (the actual date of completion was 1875). "In 1858," he writes, "the whole work is to be performed here in Zurich. Should I not then be alive, so much the better. Then, perhaps, Rietz will produce the whole thing in Leipzig as a funeral service for me; which would be a true analogue to my whole life."

Emma Calvé will be at the head of the soloists of the Maine Festival, to be given this year, as usual, at Portland and Bangor, under the direction of W. R. Chapman. One of the features will be Saint-Saëns's "Samson and Delilah," in the cast of which will be the excellent young baritone, Cecil Fanning, who will also fill one part of one day's programme with a song recital.

News comes from Italy of the assured success there of "Sarrona," a grand opera in two acts and a prologue, of which the music, text, costume-designs, and scenery are by an American, Legrand Howland. This young man, with an associate, Thomas Wilhelm, was appointed impresario of the Carnival Season at Piacenza, in Italy, where "Sarrona" was then being produced. It is the first time an American has ever held this position in connection with a Government opera house in Europe. The opera's record during the year in which it has been before the public is somewhat remarkable. It was first produced in symphony form at Monte Carlo and at Aix les Bains. Thereafter it was given in the municipal opera houses of Piacenza, as already stated, during the carnival, when it had a remarkable success; at Varese, Naples, Florence, Udine, Trieste, and at Pola, a naval port of Austria. More recently, six performances were given at Milan in one week, and wherever it has been heard the reports of the enthusiasm of the audiences have been unanimous. The Grand Opera House Fenice at Venice has opened negotiations for the opera, and the agents have offered a tournée of Germany. It will be interesting to see whether the German critics repeat the enthusiastic appreciation shown by the Italian press.

Art.

A History of Tapestry from the Earliest Times until the Present Day. By W. G. Thomson. New York: G. P. Putnam's Sons. $12 net.

This book commands the respect of the student, because of its unpretending character. It is avowedly a compilation, but it contains a vast number of hitherto unrecorded facts, assembled from many sources, English and foreign. Although there is no bibliography, a very full one might be gathered from the footnotes, with this exception, that English translations of books are preferred to the originals. The volume is, then, a history in the sense that it is a record, and little else; but it is well that, however entitled, these prodigious accumulations should be published. The work lacks, however, an adequate index. Three separate tables, "The Chief Centres of Manufacture," "Subjects of Tapestries," and a list of Tapissiers, Merchants, Painters, etc., do not altogether make up a sufficient key to the contents.

The important part begins in chapter iii., the early tapestry of Europe. Then the fourteenth century is treated in chapters iv. and v., with distinctions carefully drawn between the work of Paris and that of Arras, Germany, and England. Much of this information is new in the sense that it has not been accessible. The four following chapters are devoted to the fifteenth and early sixteenth centuries, in which period tapestries were made even in Scotland. Those of Arras have a chapter to themselves. The whole of chapter xv. is devoted to the sale by the Commonwealth of the royal collection made by Charles I. Two chapters only are devoted to the famous French workshops of the seventeenth century, but that branch of the subject has been carefully elaborated in other books.

The most original section is the first two chapters, which deal with pre-Christian tapestry, including the recently studied—we might almost say the recently discovered—tapestries of Christian Egypt. And here is strongly evident the difficulty which the student will find in using this book for anything more comprehensive than a record of dates and facts. Just as there is nowhere between these covers an adequate account of the manufacture of tapestry, so there is no clear distinction between one ancient decorative weave and another. Indeed, there is a disposition to classify any textile of great beauty of pattern as a "tapestry," without regard to its structure; and so, looking back to pages 2 and

3, which contain the only account of tapestry weaving and to pages 11 and 12, in which Andromache and Helen are found at work in the pages of the "Iliad" and the "Odyssey," the student is left with the conviction that any ornamental, certainly any very rich, textile fabric would be regarded by the author as belonging to his subject. To the special student, however, tapestry is a peculiar and separate thing. It is not strictly a textile, if the word textile be defined in a minutely accurate way. It is as nearly a work of pure art as any production can be which depends upon the use of tools more elaborate than pencil and modelling stick. It is essentially an art of secondary impulse, like other arts of decorative design. Or it might be said that the translation by the operative into terms of dyed woollen is as purely an artistic process as the translation by the etcher into lines engraved upon copper, of an original which presents the artist's thought.

Owing to this looseness of definition, the illustrations of the book are really more important than its text. The text tells us about the facts, but the illustrations lay the facts before us, and this in an admirable way for any work short of a costly folio. There are 82 illustrations, of which three or four only are printed with the text. Four are large folding plates with color-printed representation of important tapestries, complete and excellent, especially in their appearance of unflinching verity. All the rest are well made half-tones; and the practised reader will understand that even a well made half-tone may fail to present clearly and forcibly a worn, faded, creased, and repaired old tapestry. The splendid photogravures in this or that French or Austrian book devoted to the subject belong, indeed, to another category, and we must be content here with the instructive illustrations of a guide-book. We take leave of the author, then, with admiration of his power as a faithful draughtsman, and with respect for his diligent search among original sources of information.

To all students of the history of art, whether ancient or modern, the name of the Munich publishing house of Bruckmann has become familiar on account of the range and the high quality of the series of monumental works they have been issuing. It is due to their enterprise that students of classical sculpture have now at their command, in the "Denkmäler griechischer und römischer Skulptur," in Arndt's "Griechische und römische Porträts," and in their publications of special collections, material which can be surpassed only by great collections of casts such as few cities or universities can provide, while Furtwängler & Reichhold's "Griechische Vasenmalerei" offers the most accurate and beautiful reproductions of Greek vase-paintings ever attempted. It is, therefore, gratifying to note that they have now turned their attention to Greek and Roman paintings, in a series of folio plates, with accompanying text, to be entitled, "Denkmäler der Malerei des Altertums," the first numbers of which, under the able editorship of Dr. Paul Herrmann of the Dresden Albertinum, have already appeared. We are promised that this is to consist of about 600 plates, and "will include the whole of the material which has been preserved, with the sole exception of examples which possess neither scientific nor artistic importance." By this is meant not only all the wall paintings of Pompeii, Herculaneum, Stabiæ, and Rome which are worth reproducing, but also earlier works, such as the prehistoric paintings which have been brought to light by the recent excavations in Crete, as well as the wall paintings of Etruscan tombs, the few scattered remains of Greek paintings of the pre-Roman period, and portraits from the Fayum. Mosaics also will be included to a limited extent, where these are clearly copied from paintings. The work will undoubtedly give a new stimulus to the study of Greek painting, an art which the Greeks esteemed quite as highly as they did their sculpture, but which has been largely neglected by modern students, partly because of the loss of original works by the great painters, or even copies of them, and partly because of the lack of trustworthy reproductions of the paintings that have survived. The basis of the series which has now been undertaken is photographs carefully and especially made from the paintings themselves, each to be reproduced by the process best suited to its requirements, whether phototype, photogravure, chromolithography, or lithography and collotype combined. There will be a limited number of colored plates, but the expense of preparing these with the standard of accuracy which has been adopted is too large to admit of many, and the majority of the plates will, therefore, be in monotone. Those of the first numbers, which have reached us, give easy assurance that the high quality of the Bruckmann publications will be maintained.

Théobald Chartran, the painter, died in Paris on Wednesday. He was born at Besançon in 1849, was a pupil of Cabanel, and exhibited his first picture in 1872. In 1877 he won the Prix de Rome. His specialties were religious subjects and portraits. He visited America several times, and painted pictures of a number of well-known Americans, including President Roosevelt.

Finance.

LOW PRICES FOR HIGH-GRADE SECURITIES.

Every one is familiar with the off-hand theories which have been put forward to explain the present high prices for money, the decline in the best grade of securities, and, particularly, the troubles of our great railways in raising fresh loans, and the exceptionally high rates of interest they have had to pay. Mr. Harriman blamed it all on the laws to regulate the railways; even Mr. Vanderlip intimated that the only remedy was a more lenient temper towards the railways. Similarly, Londoners have insisted that the so-called "Socialist tendencies" of the Campbell-Bannerman ministry were making the trouble. Even at Paris, the proposed income tax, now put over for a year, has been gravely assigned as the sole cause of financial disturbance.

All this special pleading Paul Leroy-Beaulieu has brushed away in a recent discussion in the *Économiste Français*. He perceives, with all experienced and unbiassed observers, that, while such incidents may inflame a troubled situation, they can hardly have caused so uniform a series of phenomena, visible in every money market of the world. The peculiarity of the present strain on capital has been, as our readers are well aware, its worldwide manifestation. This was not true even of our season of "undigested securities" in 1903; capital was then under severe strain in England and in the United States; but in France and Germany markets were comfortable and capital abundant. Nor was it true in 1901, when Germany was bidding high for capital and the strain had fairly set in at London. Paris and New York were then reporting almost a plethora of available money. But in 1907, from New York, from London, from Paris, from Berlin, from Amsterdam, from Vienna—even from such usually neglected points as Rome, Rio Janeiro, and Egypt—the story of the money and investment markets has been the same.

Not long ago the theory had much vogue that this depression in high-grade securities, with fixed rate of interest, was due to the converging of attention on stocks with a speculative value. It was argued that when, as a result of the great activity of trade, opportunities for increase in dividends on such investments seemed to the capitalist to be unlimited, he would not readily put his money into securities which could give him no larger return in good times than in bad. Hence his reluctance to invest in that quarter of the market caused a decline in value of such securities. In this argument there was undoubtedly some truth. But when, six months ago, it became evident that investors were even more reluctant to take new stocks of sound and prosperous railways than new bonds, it was plain enough that some other force was at work. M. Leroy-Beaulieu shows with great clearness and detail what it was.

Beginning with the annual requirement of new capital for our railways, as set forth by Mr. Hill, he adds the apparent needs of other branches of our industry, and arrives at the estimate that America is asking for not less than $2,000,000,000 fresh capital per annum. But the annual increment of capital in this country, great as it now is, does not reach to one-third of that amount. To make up the balance, only two recourses exist—to obtain the capital from other countries, or to withdraw it from other and older investments in this country. The first recourse was adopted on a large scale last year; but it was soon made clear that the European markets were themselves in much the same condition as our own. In all of them, home demand on free reserves of capital was pressing closely upon supply; some of them, such as Germany, were themselves making heavy drafts on other markets. In M. Leroy-Beaulieu's opinion, only four markets of the world are to-day in a position to "export" capital. These are England, France, Belgium, and Holland; and of the four, England is largely out of the field because of the impairment of her resources in the Transvaal war, and because of the prior demands by the colonies. This is in accord with the belief of the British Chancellor of the Exchequer. In a speech

on July 4, Mr. Asquith attributes the shrinkage in "gilt-edged securities" to "the permanent destruction of capital," and the "trenching on the reserves normally free from encroachment."

Beaulieu's conclusion is unhesitating. The world-wide expansion of industrial and financial activity must be checked until supplies of capital, in the process of accumulation, again exceed demand. This check to activity involves, in his judgment, reduction in prices on financial markets—which is the process now actually before our eyes—and reduction in the price of raw material of manufacture, whose abnormally high level is largely responsible for the absorption of capital, on the present scale, in productive industry. The action of the copper market this past week—a voluntary reduction of 2 to 3 cents a pound by producers, in the face of their assertion that the whole world is "short of copper"—followed close on his prediction. Finally, he warns the industrial markets that some at least of the plans of expansion already under way must be postponed to a more convenient season.

It might perhaps be supposed that this judgment would be construed into an omen of serious reaction or disaster. The situation has not so been regarded by our own practical business men, such as Judge Gary, Mr. Frick, and Mr. Hill; nor is it by M. Leroy-Beaulieu. His opinion clearly is that a period of hazardous inflation is being brought to a fortunate close, and that the financial and industrial situation is not only more normal, but much safer, for the check. His feeling as to the future is sufficiently indicated by his advice to investors that the present situation offers to capitalists, large and small, a legitimate opportunity for placing their funds to advantage, such as they have not witnessed in twenty years.

The death is announced of Karl Umpfenbach, who, until 1900, was professor of political economy at the University of Königsberg. Among his works are "Des Volkes Erbe," "Volkswirtschaftslehre," "Kapital in seiner Kulturbedeutung," and "Altersversorgung und Staatssozialismus."

BOOKS OF THE WEEK.

Aimes, Hubert H. S. History of Slavery in Cuba, 1511 to 1868. Putnams. $1.50.
Allin, C. D. Early Federation Movement of Australia. Ontario: British Whig Publishing Company.
Annual Report, Superintendent of Banks, Building and Loan, and Coöperative Savings and Loan Associations. Albany: J. B. Lyon Company.
Bartlett, A. E. Dramas of Camp and Cloister. Boston: R. G. Badger. $1.50.

Automobiles.

L. H. PERLMAN GETS THE Aerocar

¶ **The Aerocar Company of Detroit** desires to inform the public that hereafter the Aerocar interests in New York will be represented by Mr. L. H. Perlman, who has secured the Metropolitan agency of the Aerocar.

¶ Mr. A. M. Robbins, the former manager, has been promoted to the position of district manager of sales in the territory of New England, Pennsylvania, New Jersey, Delaware, Maryland and the District of Columbia. Mr. Robbins' headquarters will be at the offices of the new agency in New York.

¶ This recognition by Mr. Perlman of the Aerocar is a splendid tribute to its efficiency and worth as the best of the moderate priced automobiles. That a man of his experience should decide in favor of the Aerocar is strong and conclusive evidence of its superior mechanical equipment.

¶ Following so closely the brilliant record of Aerocar achievements in innumerable contests, this indorsement makes the triumph of the Aerocar complete in New York. And it must not be forgotten that New York is the greatest and most critical automobile market in the world.

¶ By this move the Aerocar will continue to occupy the foremost position among the automobile agencies in the Metropolis. Its selling qualities have been very much in evidence this year, and have won for it a splendid success. When the price is considered, it is small wonder that the Aerocar has overcome all opposition and blazed its way to prominence so quickly.

¶ For 1908 the Aerocar line will be even nearer the ideal than in the past. It will eclipse everything that has gone before in its class, and it will stand pre-eminent among motor cars. Each model will be a practical automobile at a price that will submerge competition and satisfy the most keenly discerning critic of automobiles.

¶ Aerocars are now on exhibition in the show rooms of the Welch Motor Car Co., L. H. Perlman, President, Broadway and 62d St., where a competent staff of experts are on hand to welcome you and explain every feature of construction. Telephone 5623 Columbus.

SCHOOL ADVERTISING IN THE NATION

The *Nation*, in its special field of political and literary criticism, is unlike any other periodical, American or foreign.

Besides going to homes of culture, it is taken by reading clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Orders may be forwarded through any responsible advertising agency or directly to

The Nation.

NEW YORK, THURSDAY, JULY 25, 1907.

The Week.

"When," asks the Cincinnati *Enquirer*, "are the Democrats going to do something besides yelling murder? Why don't they open their best artillery on the standpatters? The pat people can't stand long if the fire is well directed." These remarks gain fresh pertinence from the account given by Senator Hopkins of President Roosevelt's position respecting tariff revision. The Senator talked with the President one day last week for two hours, during which he "gained the impression" that "there will be no tariff revision until after the next Presidential election." Senator Hopkins adds that he himself thinks it will be "suicidal" for the Republican party to touch the tariff during the next Congress, but that, "after the Presidential election" it "will be the duty of the Republican party to revise the tariff." This seems to imply that, when once the party has elected a President, it doesn't matter whether it commits suicide or not. In all seriousness, this situation furnishes its own comment, not only upon Republican sincerity, but upon Democratic sagacity. With such an issue as this fairly forced upon them by their political opponents, the Democrats are neglecting it, and are casting about for new forms of "yelling murder." Col. Watterson advises the party to take up with the cry, "Back to the Constitution." As well make it, "Back to Nature." Any mere generality like that would have no more rallying power than an algebraic formula. Specific abuses, concrete reforms, are the necessary weapons of a political party in opposition; and the tariff provides whole arsenals full. In view of the admissions which Republicans themselves now make, the argument could be turned against them with overwhelming effect.

In one of the New York papers we read an authorized statement of President Roosevelt's position in regard to the sending of the battleship fleet to the Pacific, which is most welcome. It is here represented that the object of the proposed cruise is to ascertain the defects of the fleet, if any; that no order has been issued by the President or by the General Board; that the plan was made before the recent war flurry, and that the fleet *may* go to the Pacific. So far, so good. We sincerely hope that before long the "may" will become "will not"; but it is reassuring, indeed, to know that nothing is definitely settled as yet. Of course, this does not explain the contradictions of the Presidential statements of two weeks ago. Moreover, it puts Secretary Metcalf, with his promise of the greatest naval spectacle the Pacific Coast has ever seen, in a most delightful pickle. He must either pose as a braggart who cannot substantiate his boasts, or as an ignoramus in regard to happenings in his own Department. There is only one way out: Let him put the blame on the much-enduring Loeb.

That the man chosen to act as Mayor of San Francisco with almost absolute powers should turn out to be a prominent scholar, educator, and physician, is another indication of the distance we have travelled from the time when that rare species, "the scholar in politics," was tolerated by the practical politicians only because public opinion would not quite sanction cruelty to a harmless creature actuated by good intentions. A writer and a student of American history, up in New Hampshire, has succeeded in bringing the practical politicians face to face with a problem which they find exceedingly perplexing. Another novelist seems to be attaining merit as Mayor of Toledo. Even at Albany they have heard something of a man with the temperament of the juristic scholar, who saved a great party from the utter ruin that its practical leaders so zealously prepared for it. And to show how the world has moved on, it strikes us as nothing unusual that in its present desperate plight San Francisco should turn to a man whose geographical knowledge extends beyond the boundaries of his ward, and whose mathematics contains no formula for the determination of political assessments on shopkeepers and dives.

Even the Louisville *Courier-Journal*, which is not known for its friendliness to Gov. Beckham of Kentucky, admits that his appointments of officials for the new city government of Louisville have been beyond criticism, with one single exception. They in turn have chosen as their assistants men who stand well before the community, and are desirous of governing well. Hence the city's affairs are being better administered today than at any time for years past. It is, of course, no easy task the reformers have before them, the ousted officials being already hard at work to hamper the efforts of their successors, who must fight for their political lives at a new election next fall. But at least they are unhampered by any of those political obligations which prevented those who stole the government from administering it well. No doubt Mayor Bingham and his associates will find themselves handicapped by "immemorial abuses, contrariety of opinions and report," and "the perversity and selfishness of friends and alleged friends." Yet the new appointees are cleaning up the city in earnest, have already closed the saloons on Sunday, and disciplined all the commanding officers of the disreputable police force, thus displaying both courage and vigor. Gov. Beckham helped them, too, by not appointing a single member of the rightfully elected reform ticket. This leaves the new officials quite free, and without the handicap of campaign animosities.

Judge Story would have some new illustrations of the "Conflict of Laws" could he write about the recent clashings between State and Federal courts. Passion seems to be running high in North Carolina over the orders of the United States judge restraining the authorities of the State from putting the new railway law into execution until after its constitutionality had been determined. Tall talk is indulged in by the Governor, and by some members of the State judiciary, but we presume that sober counsels will prevail and the Federal writ be duly respected. A speedy and orderly determination of the legal questions at issue should be sought by all concerned. The North Carolina case is not unlike that of the Consolidated Gas Company in this city. In the latter, too, a Federal judge stayed the execution of a State law until it should appear that its effect would not be confiscatory. There was much newspaper and other grumbling, but Judge Lacombe's decision has been regarded as binding in New York. So, in the end, will Judge Pritchard's be regarded in North Carolina.

The Board of Visitors to the Military Academy at West Point, in its report just published, takes a radical view. "An officer," it says, "should be an all-around educated gentleman. As it is now, his entire training, both preparatory at the Academy and post-graduate, is almost purely technical." Hence the Board of Visitors calls for a general revision of the scheme of instruction. It thinks that time should not be devoted so exclusively to technical studies, and that a broad course in literature, with independent reading, would do a world of good. In this the Visitors have exposed one of the most evident weaknesses, and it is to be hoped that President Roosevelt will appoint a board of officers for the revision of the curriculum, like the one that has just reported on the Naval Academy of Annapolis. It

is a pity, however, that, so far as yet appears, the West Point Visitors have not called attention to the mental and physical overworking of the cadets. Reputable army physicians maintain that life-long injury is done to the cadets in this way, and assert that it is frequently a year or two after their graduation before some of them return to a normal condition.

The latest disaster on the Pacific brings out once more the dangerous nature of navigation on the Northwest coast. It also emphasizes anew, with many recent incidents, the fact that fog is, after all, now the greatest danger which confronts seamen. On the Atlantic, the Kronprinz, in a fog, grazed an iceberg the other day, yet it was not discovered until the ship was almost on top of it. And last week two fishing smacks were run down and sunk by steamers in a fog, while a third was barely able to crawl into port. Obviously, scientists need to give their attention to methods of safeguarding ships in a mist. Of course, there can be no warning from an iceberg or a submerged wreck, but the under-water bell gives great hopes that it is a better way than the steam whistle of giving notice of a nearby danger. It is now being installed in several places along the coast, so that ships may find their way into port when unable to see the coast lights, or take a reckoning. It may also give the special protection to sailing craft they so sadly lack, in the absence of whistles. If what its inventor claims for it is true, the Board of Steamboat Inspectors will soon find it worth while to insist upon its adoption, as it does upon lifeboats and life-preservers. The Navy Department has ordered it for twenty-three vessels of various types.

The need of an international Theatrical Trust, such as is now proposed, has long been apparent. The existing syndicate has been continually hampered in its efforts to build up a national theatre along national lines by the constant invasion of "unorganized" foreign plays and actors. How can the cowboy drama, for instance, be carried to the point of ideal perfection if, just when we have succeeded in evolving a half-dozen examples of the type, Hauptmann or D'Annunzio sends over a play that seems to have been written in entire disregard of the life and ideals of the Wild West? A combination of interests that shall regulate the dramatic output, after the fashion of the Steel Trust, in various countries, would do away with the evil. We might then have the Pinero and Sudermann plants shut down for a couple of years, while the Sardou and Fitch foundries were run under full blast, or vice versa. And in the same manner ruinous competition among the actor folk would cease. No pauper Italian or Russian actresses should come here unbidden to play "Magda" or "A Doll's House" in the teeth of our native talent, or shatter, by the sweep of their crude European emotions, long-established traditions which call for the interpretation of "Hedda Gabler" or "Divorçons" by young and golden-haired ministers' daughters from Illinois.

A law in Texas against pistols? The thing seems incredible. As well expect a statute forbidding the domestic use of the bowie-knife. And yet on Sunday there went into effect in the Lone Star State a law imposing a tax of 50 per cent. on the gross earnings of the whole business of all who sell revolvers. That is, if a man keeps general hardware and pistols too, he must give half his profits to the State of Texas. From the point of view of the dime-novel writers, this is a serious infringement upon one of their most valued patents. A Texan cannot properly be represented save with a revolver on each hip and a bowie-knife in his teeth. Now, if only the bowie-knife is left, obviously Dick, the terror of the Rio Grande, becomes a purely mediæval figure instead of fearless graduate of the Rough Riders; and the number of sheriffs he slays at one fell blow must obviously be reduced from twelve to one or two. Still, aside from this aspect of the matter, there is much that commends itself to us in this novel Texas law. If there is an industry which we should like to see a Government monopoly, it is the manufacture and sale of firearms. They ought to be made the costliest kind of luxury, and, if the Texas departure can bring this about in any degree, the experiment might well be tried elsewhere.

Prof. Gustave Lanson of the Sorbonne holds that discipline in the French universities and colleges is very bad, yet that the proper way of dealing with the evil presents a "bitter and irritating question." The most serious thing is that professors as well as students show signs of insubordination. Professor Lanson declares that those in authority seem helpless to deal with the rebellious faculties, which are imitating obstreperous students in petty revolts. The old scholastic discipline, he continues, was conformed to the discipline of the political world. It spoke in the imperative. Respect was written in the rules, even if not imprinted on the heart. But now even this formal observance of rules is neglected; and the professors, by exploiting their grievances in the press, try to intimidate the educational administration. They form cliques and conspiracies. Professor Lanson is reluctant to discuss this grave trouble, foreseeing that it will play into the hand of the reactionaries, especially the clerical party. But the truth must be told, and, like a young man, the new republic must learn to correct its faults. The conflict complained of is analogous to that which occasionally takes place in our own university faculties, where a small group of professors set up a factious opposition to the general policies of the institution. As Professor Lanson remarks: "Some men like to win, if only that by winning they may make it disagreeable for others."

The dinner given to President Butler by the authorities of the University of Paris emphasizes once more the valuable part played by our educational leaders in the work of promoting international amity. While Hague Conferences meet to thresh their modicum of result out of vast crops of verbiage, good feeling between nation and nation thrives in the favorable atmosphere of academic halls, gymnastic associations, and singing societies. The Anglo-French *entente*, for instance, is being carefully fostered by various coöperative educational schemes, including an exchange of teachers, holiday trips of teachers and pupils across the channel, and the training of English and French schoolboys to the familiar use of the language employed by the friendly and allied nation just over the way. In the same manner it has been suggested that English schoolboys be taught the Japanese national hymn, and made to memorize choice bits from the literature of Nippon. We know, of course, that this blissful state cannot long continue; that the law of tooth and claw rules the world of thought and education as it does that of trade; that, in the course of time, as the universities of Germany and Great Britain continue to pour out more Ph.D.'s and M.A.'s than the home market can consume, a desperate struggle will ensue for the control of foreign spheres of influence, and that the decision of the Sultan of Morocco or the Shah of Persia to model their high schools on the French *lycée*, rather than the German *Realschule*, will bring about the same complications that now follow the awarding of a harbor-dredging contract to one nation rather than another. All this we know, yet we cannot help drawing satisfaction from the present peaceful state of affairs.

At The Hague the American contention in favor of the inviolability of private property at sea in time of war has been handsomely upheld. Under Mr. Choate's effective leadership, a vote was finally had upon the main question, and twenty delegates were for the new law of war, to only eleven against. This vote is not, of course, binding, but it represents a genuine moral victory, and shows what can be done by vigorous argument and forcing squirmers to come

to the scratch. The distinction made by M. Martens that the eleven delegates represented a larger population than the twenty, seems very ill taken. The equality of the nations in the Hague Conference is at the root of its being. Great Britain, standing with Russia and France in opposition to the humane proposal, is in a very unenviable position. Her offer to limit her naval programme, if other nations would, bore the construction that she was satisfied of her supremacy on those terms; and now her unwillingness to make private property at sea immune, causes her attitude to appear decidedly ungenerous.

The readiness with which both the Premier and the leader of the Opposition joined in shelving, in the House of Commons, the motion to inquire into the connection between contributions to English party funds and the bestowal of honors by the Crown, is striking proof that such an investigation would be decidedly disagreeable to both sides. For a long time past there have been plain intimations that certain knighthoods and decorations were bestowed, much as ambassadorships are awarded in this country, in return for cash favors received. Sometimes, too, loyal newspaper proprietors who have stood by the party have found their way upward in the social scale with amazing ease. The strict limitation of candidates' expenses and the rigid oversight of individual contests in order to prevent bribery and corruption have, of late, it has frequently been averred, made it more and more important for the central committees of Liberals and Tories to raise large funds for educational campaigns. Since diplomatic offices cannot be promised, baronetcies have doubtless seemed very convenient—as if made for the purpose. It would be wholly wrong to infer, however, that any great proportion of honors have been awarded in this way. Merit and talent and worthy public service are still recognized. William Cremer, for instance, has thoroughly earned his new title of Sir by his invaluable services on behalf of peace.

Troubles of the Church in France have not lessened the activity of writers on theology. In the *Revue de Métaphysique et de Morale*, M. Wilbois gives an account of "Catholic Thought in France at the Opening of the Twentieth Century." During the last ten years a large number of reviews have been founded dealing with questions of Biblical criticism, Christian philosophy, apologetics, and ecclesiastical polity. There has, furthermore, been remarkable industry in the collection and editing of older literary monuments and sources of history. The wave of modern thought which has moved the laity makes it necessary for the clergy to equip themselves. M. Wilbois reports that young men of high class are now being trained for the priesthood in the French seminaries and universities. At the former, they devote themselves to the classics; at the latter, to the sciences. Such a modern element may, however, at length have a disquieting effect upon conservative churchmen. Already, the Abbé Loisy, by his work, "L'Evangile et l'Eglise," has taken virtually the position once occupied by Newman in his "Development of Christian Doctrine." He will doubtless find himself and his fellow-liberals exposed to a cross-fire from the orthodox on one side, and the scientific on the other.

The large number of "Back to Something" movements may be increased by a vigorous "Back to Europe" agitation. Italy is greatly concerned with the problem of regaining part of the enormous population that she loses annually by emigration, or at least that fraction whose return would add to the prosperity of their native land. Now it is reported that the Swedish Government is making investigations among its former subjects in this country, with a view to securing their partial repatriation. According to the 1900 census, there were in the Continental United States 1,084,000 residents of Swedish origin, of whom just half a million were native-born. From that class King Oscar could scarcely hope to draw colonists for old Sweden. On the other hand, if a considerable fraction of the remaining 584,000 Swedish-Americans should prove responsive enough to the call of the native soil to seek still newer fortunes under old conditions, Sweden might find compensation for the loss of the Norwegian partnership, not so much in the actual number of emigrants returned, as in the new spirit of enterprise which they could not but bring with them across the ocean. The very fact that the Swedish Government should think it possible to persuade such emigrants to return, argues a general determination to bring backward Sweden sharply in line with the march of democratic progress. She is now working out the problem of universal suffrage, but other improvements must be made before the country can hope even to check her present annual emigration of some 25,000—a very large figure for a population of 5,000,000.

Korea, to-day, stands in so far the better position that responsibility for what henceforth takes place in the Hermit Kingdom can be definitely fixed. If Japan has chosen to make her authority direct and apparent, instead of indirect and masked, she has also pledged herself to take such action as will remove the ugly rumors brought forth by the first two years of her rule. That the Japanese have ridden rough-shod over the Korean people—whatever fictions were maintained with regard to the machinery of government; that Korean peasants have been robbed of their lands by Japanese immigrants and military officials, and have been denied justice in the courts; that the appropriations for public works have been largely expended in improving the ports and settlements where the Japanese predominate—would seem to be well-established by a large body of testimony. A nation proud of its extraordinary military achievements secures the master-hand over a people notoriously submissive. Ambition, covetousness, and mere brutality, as exemplified in the mass of Japanese coolie immigrants into Korea, apparently come into full play; and though Japan retained direct control of her subjects in Korea, it was her excuse that the resistance of the Korean people and officials made her task hard, and brought on most of the evils complained of. This excuse has now been removed. Japan has a free hand in the execution of necessary reforms, and she should exert herself to do away with the impression that it is her policy in Korea to suck the country as dry as possible in the least time. International agreements may have made her immune against official interference on the part of the Powers, but she must be aware that failure in Korea—and oppression leading to discontent is a form of failure—would stand seriously in the way of whatever wide ambitions she may be cherishing.

Hungary, without a racial conflict on her hands, is like an Irishman without a quarrel, a yellow extra without Pelasgian headlines, or a cardinal virtue without a Presidential endorsement. The relations between Budapest and Vienna are still in an extremely unsettled condition, but Minister of Commerce Kossuth must needs go and stir Croatia to fury by submitting a bill requiring all employees on the state railways to make use of the Magyar language throughout the dominions of the Crown. In Croatia, this is held to be a direct violation of the compact of 1868, which made the Croatian language the official medium of communication, even for the local representatives of the central Government. The Hungarian Government meets the accusation with a double evasion. In the first place, it argues that the railway administration is not a "joint" interest in the sense contemplated by the agreement of 1868, and, second, that railway employees are not, strictly speaking, functionaries of the state. Croats and Magyar Independents stood together two years ago, when the Liberals were ousted from power. Now Croatia is experiencing the bitter sting of ingratitude.

IS BRYAN INEVITABLE?

"The boldest act of cowardice ever heard of." Such was the characterization of one of the Duke of Wellington's announcements of Government policy. It might with double force be applied to Mr. Bryan's repudiation, on Saturday, of his own pet issue of Government ownership of railroads. Put forward by him inconsiderately a year ago; clung to obstinately for a time, in the face of protests by influential men of his party; latterly, qualified and minimized; Mr. Bryan has now discovered that it is unpopular and is injuring his chances as a candidate for the Presidency, therefore he coolly declares that "there is no desire anywhere to make Government ownership an issue in 1908." Self-stultification could hardly be more complete.

Moreover, Mr. Bryan may attempt to run away from his issue, but it will not abandon him. "Where thou goest, I will go." In a word, he cannot free himself from whatever discredit attaches to him for having rashly raised a controversy on a subject which he had not studied, and from the political discussion of which he is now anxious to retreat. The thing is impossible. Suppose him the Democratic nominee, and the issue would be thrust in his face from every stump in the land. His party would have to bear the odium; just as it suffered in 1900 from the odium of his egregious blunder about silver in 1896. That cause, too, he has now dropped. But what does he imagine the country thinks of a statesman who obligingly discards one conviction after another, as if they were so many worn-out gloves? There is a difference between political opportunism and mere demagogue's shiftiness. If Mr. Bryan's aim was to demonstrate to his party and to the country that he is a flighty man, unstable in all his ways, with an enormous capacity for stirring up agitation but with the smallest faculty for using it to the good of the commonwealth, he could not have gone to work more successfuly than by emitting this last uncertain sound on his trumpet. It signals retreat, and reveals the commander in a state of confusion and panic. What can be expected of the troops?

The Republicans may well exclaim: "The Lord hath delivered this Philistine into our hands." For Mr. Bryan lays down a plan of campaign which is absolutely hopeless. He is stoutly for railway regulation, with the admission on his lips, all the time, that regulation is bound to fail. He is for determining "the real value" of the railways—an abstraction as deep as any conception of the mediæval Schoolmen—and for preventing over-charges and over-capitalization alike; but he states in the same breath that this is merely by way of experiment, to prove that he is right, that regulation is certain to break down, and that we shall have to come to his "ultimate" solution of Government ownership. Fancy an election contested on such lines! Bryan will appeal to the voters to put him in power to do—what? Why, something which he admits is wholly impracticable and barren, which will do them not a particle of good, leaving them, in fact, worse off than before! Nothing like that has ever been known in our political history. We have had fictitious issues, and candidates running on false pretences; but we have never yet had a man standing for the Presidency who frankly announced that the thing he promised to do he could not do, and that it would neither benefit nor satisfy the country if he could! When Mr. Bryan talks thus of his "ultimate" solution, it ought to follow that his party should think of him only as an ultimate candidate—ultimate in the sense that he could be only the last desperate resort.

As a matter of fact, it is plain that the Democratic party is doing a great deal of thinking about the desirability of taking next year some candidate other than Mr. Bryan. He has been generally and tacitly regarded as inevitable, but is he? Very likely, he is in substantial control, to-day, of the party machinery. He could force his own nomination, we presume, if he so willed it. But can he afford to do this? If he were to dominate the National Convention only after a bitter contest, and in the face of powerful and implacable opposition, what would the nomination be worth to him? Even he cannot wish to be known as the perpetual candidate, doomed to perpetual defeat.

Aside from all questions of principle, the test of mere "availability" is one which it is daily becoming harder for Mr. Bryan to endure. Twice beaten, the second time worse than the first; a candidate whose leadership infallibly means further disruption of his party, with a diminished chance of drawing votes from Republicans; a politician cursed with a talent for running off on the wrong scent, and barking up the wrong tree; one who almost advertises that his opinions can be altered while you wait—what party in its political senses would think, ordinarily, of nominating such a man? His candidacy, though so widely thought to be fated, has nowhere aroused enthusiasm. Democrats have merely said, in a dispirited way, "Well, I suppose that we have got to take him." If the idea were now to spread that they have not got to take him, the inevitable candidate would soon appear to be the impossible candidate.

EXPANDING THE "UNWRITTEN LAW."

Acquittals by reason of the "unwritten law" have grown surprisingly numerous. At the present rate, it bids fair to become an established part of our system of jurisprudence. Learned professors of law will soon be issuing "selected cases," as they have in the matter of torts, contracts, and what not, and we shall presently have text-books showing just when a murderer can look for acquittal, and what precise form of appeal to the unwritten statute stands the best chance of success with a jury. Such books should be properly entitled "The Right to Private Vengeance," and they will have many interesting and delicate points to elucidate, if we may judge by some of the more recent cases which lie before us.

We must note the fact that the right to slay under the "unwritten law" has now been extended to women as well as to men. At least, this is a fair deduction from the acquittal of Mrs. Mary E. Bowie in La Plata, Maryland, last week for the killing of Hubert Posey for a wrong done to Mrs. Bowie's daughter. The offence here consisted in the failure to marry the injured woman. Mrs. Bowie and her son demanded that the ceremony be immediately performed, a license having been secured. Posey refused, and Mrs. Bowie made good her alternative that "he would die right here." The killing was therefore premeditated, and no attempt was made to deny it. Yet the jury unanimously found that Mrs. Bowie and her son possessed in this instance the right to execute. A contrasting case is that of Mrs. Birdsong in Mississippi, who killed her physician after making the gravest possible accusation of personal and professional misconduct. The doctor was given no chance to clear his reputation before being put to death, and the courts, even to the highest in the State, were unfeeling enough to condemn Mrs. Birdsong to life imprisonment. Not unexpectedly, this aroused considerable feeling in Mississippi. In many an editorial, now reinforced by the Bowie verdict, an appeal for women's rights appeared. It was urged that the right to slay under the unwritten law should know no discrimination of sex. Gov. Vardaman holds this opinion, and will therefore shortly release Mrs. Birdsong from jail.

And the unwritten law now applies to negroes as well as to white men. That is, of course, consistent and good law, even if uncodified. The right of the injured person to slay, once granted, should not be abridged by age or sex or color or previous condition of servitude. This negro case occurred in Columbia, S. C.; the offence was admitted, and the jury was white. The judge was a narrow-minded person who solemnly informed the jury that there was only one law in South Carolina, and that was the written law. The jury unanimously undeceived the judge. This makes all the more remarkable the action of a jury

at Gaffney, S. C., which convicted W. H. Mills of killing his wife's paramour. The counsel for the husband—his "beautiful" wife sat by him and encouraged him throughout the trial—made, we learn, "an admirable plea to the sympathy of the jury," but the stony-hearted twelve found Mills guilty of murder, with a recommendation to mercy. Obviously, if there had been available such case-books as we suggest, this inconsistency could not have occurred.

Next we note the reappearance of the "unwritten law" in Belgium—not, as some of our contemporaries would have it, the very first instance known in Europe. In all of its aspects, this drama might have been enacted anywhere in the United States. Like the Bowie case, the unforgivable sin of the "deceased" was his refusal to marry. As in the recent Loving case in Virginia, the evidence did not show that the injured person was wholly fitted to teach in a Sunday-school. Indeed, the letters of the shamefully treated young woman in the Belgian case, introduced as evidence, suggested the writings of Fielding and Smollett, rather than Jane Austen. But the jury refused to let that weigh with it. Indeed, this case may be said to open up quite an opportunity for the learned defenders of the law we note here and there in the press. Just how moral need the victim be to give her next of male or female kin the right to kill? Or how immoral must she be before she crosses the line which would transfer from her relatives to the courts of the land the right to take cognizance of a wrong done to her?

The question whether the accused should or should not have the right to clear his character before death is, we regret to observe, agitating the whole Virginia press since the Loving acquittal. If you once admit that the private executioner can make a mistake, or err in his judgment as to what the sentence shall be, and how it shall be carried out, you undermine the very foundations of this sacred law. As it were, you commit contempt of court by insinuating that it can be led astray, and every editor so offending ought really to be jailed on bread and water. The lack of power so to punish is, perhaps, behind the suggestion that the "unwritten law" should now be written on the statute books, on the ground that, after all, it but bespeaks public approval of the supremacy of primordial feelings and instincts. This is gravely debated by the Lynchburg, Va., *News*, which finally concludes, however, that the law should be left unwritten. There remains this single drawback to Virginia's enacting the "healthy, wholesome public sentiment of the people into law":

> Let it be known that under given circumstances her laws will by implication give to man the right to kill, and the time would not be long in coming when the condition would serve as excuse and blind and shelter of defence, behind which the wilful murderer would attempt to hide, and often succeed in the essay. A "trumped-up" pretext, collusion, conspiracy, and what not, would be the means by which many a guilty wretch could escape his just deserts.

This, we submit, is mere pettifogging, and shows that the advocates of the unwritten law have still much expounding to do besides expanding their pet statute to its logical conclusions.

THE SOLACE OF IDEAS.

At the unveiling of a tablet at Oxford, the other day, in commemoration of Cecil Rhodes, Lord Rosebery spoke out of his personal knowledge of that remarkable man. He dwelt, in particular, upon the deep comfort which Rhodes long took in brooding over and perfecting the plans for his great Oxford endowment. He once said to Lord Rosebery: "When I find myself in uncongenial company, or when people are playing their games, or when I am alone in a railway carriage, I shut my eyes and think of my great idea. I turn it over in my mind and try to get a new light on it; it is the pleasantest companion that I have." And at times when Rhodes was attacked, too, when he was called a money-grubber and a disgrace to the English name—we will not inquire here with what truth—he would say: "All this does not worry me in the least. I have my will here, and when they abuse me, I think of it, and I know they will read it after I am gone, and will do me justice when I am dead."

Such companionship and comfort of high ideas must rank as one of the purest joys of life. They furnish a pleasure which is, in many ways, more common and more intense to-day than ever before. With large accumulations of wealth become so numerous, large plans of philanthropy are cherished by more people. The fore-reaching satisfactions of a wise founder must be very great. If a man of phlegm like Cecil Rhodes could find such solace in them, what must not be the anticipatory delights of more sensitive and demonstrative benefactors? There is occasionally a comic side to the experience. Some curmudgeon of a miser will chuckle to himself as he thinks of the reversal of public opinion about him which will take place when it is found that his life-long stinginess was but a means to a splendid burst of posthumous generosity. Unexpected charities or endowments on a large scale sometimes seem especially planned to dazzle, or to bid for the addition of surprise to applause. The Rogers bequest to the Metropolitan was on this order. Such unlooked-for gifts to the public lend piquancy to speculation about the motives and purposes of the most unpromising of rich men. An ingenious friend of ours is in the habit of asking newspaper men where the press would find a leg to stand on if it should appear that Harriman had left his millions to found a Home for Decayed Journalists!

This may be thought fantastic. It should be noted, however, that the attractiveness of a long-meditated plan, or conception, does not depend, in the mind of its possessor, upon its being sane or feasible. A whimsical thought may be as good a companion as a solid idea. Hobby-riders are not at all particular about the animal they bestride. He may be really knock-kneed and broken-winded, but if they think him sound and shapely, that suffices for them. The happiness lies in the hobby, irrespective of its nature.

And here we may see the mistake we often make in pitying crack-brained inventors, men with physical or social panaceas, fanatics, neglected geniuses, regenerators of the world. We think their lot unhappy. So it often is, outwardly, but in their hearts they are the happiest men alive. They know that they are right, and everybody else wrong, and what source of uplifting joy can be surer than that knowledge? Some experimenter in perpetual motion, some dabbler in alchemy, will bring you his prospectus, his company formed, with a few shares yet obtainable at a high figure, and you fear that you have broken his heart, or, perhaps, shattered his faith, when you incredulously turn him away empty-handed. On the contrary, you have confirmed and strengthened him. He will go out, saying to himself, "Fools! Fools!" When a man can say that heartily—when he has attained such a pitch of certitude about his pet idea—a felicity is in his keeping which no unbeliever can ever know or ever take away.

Going back to ideas which are philanthropic and feasible, it must be admitted that their execution sometimes dims the joy of contemplation. So many vexing circumstances, so many misunderstandings, so many unwelcome criticisms may present themselves when it is attempted to change the dream into reality. But this is the peril of every artist—and the embodier of a beneficent conception may be thought of as an artist in his way. Haydon said that he was never satisfied with his work until he had forgotten what he set out to do. Benevolent ideas frequently seem warped from their original intention, by the process of taking form in brick and mortar and charters and administrators. Some have argued from this that it is better, as Rhodes did, to leave the carrying out of a great foundation to one's executors; thus to have the long solace of the idea without the worry of executing it. But there is a pleasure, too, in overcoming difficulties; and plaudits in

living ears sound grateful; so that there is reason enough for the growing custom of philanthropists to be their own executors.

LITERARY TENDENCIES.

A criticism of "Intellectual and Literary Italy at the Beginning of the Twentieth Century," by Albert Reggio, gives a rather discouraging account of Italian literature. The author thinks that "regionalism" and "hybridism" have had a bad effect upon Italian writers. By regionalism he means, of course, a provincialism which has led many to disregard the national traditions and to follow narrow and unimportant paths. Yet even Livy was charged with "Patavinity." Reggio seems, however, to have had in mind especially literature considered as an end in itself. Of this, no country is now producing a great deal.

He appears also to have overlooked the highly significant signs of the intellectual awakening in what is sometimes called "the third Italy." For, while no poet of high rank, with the exception of Carducci, has arisen in the new kingdom, and while neither D'Annunzio nor Fogazzaro shows striking originality, Italy is witnessing a marked ferment of ideas. Her universities have accomplished a great deal in philosophy, science, and law, by admirable work in lecture-room and laboratory. It is true that, with the passing away of the Pope's temporal power, and with the realization of Italian unity, many hoped for a great literary revival as an accompaniment of national self-consciousness. No such revival took place. Possibly, therefore, disappointment at not getting what was expected, blinds us to the value of what we did get.

However that may be, the "regionalism" of which M. Reggio complains has been one of the characteristics most admired in modern authors. Under the name of local color, or "faithful studies of out-of-the-way life," hosts of writers are in pursuit of it. It would be hard to name any American man of letters—excluding, of course, writers on history and science—who does not owe much of his reputation to regionalism. Nothing could be more regional than the works of Cooper and Longfellow. Thoreau was drenched in provincialism. It has been said of Hawthorne that he saw Europe with the eyes of a New England Puritan; and he displays his regionalism even when face to face with ancient Rome. Of the Italian variety of this tendency, M. Reggio remarks that most authors "in the most regionalistic country in the world" are led "fatally to get rid of all personality." Nietzsche's genius he describes as universal, D'Annunzio's as regional. "There is universality in the one, and consequently subjective genius; in the other there is only objectivity, consequently mechanism, and, thanks to the perfection of this, elegance, amplitude, harmony, plasticity."

Hybridism is the other defect observed by M. Reggio in contemporary Italian writings. It is caused by imitation of foreign models. Up to the present time, Italian literature has been too attentive to alien voices, too subservient and irresolute in the presence of exotic influences. German materialism and socialism, the logic of Hegel and the positivism of Comte, realism and symbolism, the French and the English drama, have all been hospitably received; but the result has been a suppression of originality. The Italian critics have frightened the poets into silence; the Italian editors prefer the French *feuilleton* to the *novelle* of native authors.

But if hybridism of this sort is a defect, it is one found in the literature of nearly every country. As in the days when Latin was the language of the learned, so now, when learning is polyglot, every European literature tends to be denationalized. A book that attracts notice in any one land is speedily translated into several languages. Hence no people remains outside the current, and no nation can construct a literature exclusively its own. As it was in the case of early English poetry, so it must always be. Traces of hybridism are in the works of all the immortals. There is more of Boccaccio in Chaucer than of Spenser in Milton. Shakespeare impressed his influence upon the German quite as much as upon the English drama. Especially should it be remembered that, while it is easy to trace the causes of decadence in a national literature, it is impossible at any given time to explain why no literary star of the first magnitude appears above the horizon. It would seem, then, that Reggio's mild pessimism is not wholly justified. Italy, with her distinguished place in contemporary science, is apparently doing her share in the lighter and more purely artistic forms of literary activity.

NURTURING THE RACE.

The work that is now being done by Mr. John Galsworthy, a comparatively new figure in British fiction, has been characterized as continuing the Dickensian tradition. Recent contributions by this writer to the London *Nation* show that the comparison with the author of "Little Dorrit" and "Oliver Twist" is an apt one. Like Dickens, he is most concerned with the life of London's poor and very poor, and, like Dickens, he is not afraid to be sentimental, vehement, and didactic. "Demos," a remarkable dialogue between a drunken, wife-beating London day-laborer and an undescribed interlocutor, is fully as effective a piece of special pleading as the exordium to the death scene of Little Jo in "Bleak House." "Old Age" is more photographic, more restrained, yet equally powerful as a portrayal of what terrors the simple word "future" may hold for those who have no leisure to look ahead. Both little fiction-essays—the French *enquête* would really describe them best—are reflective of the uncommon zeal with which Englishmen have lately begun to discuss at least the vast problem of poverty in its relations to race propagation and the national future. Mr. Galsworthy is distinctly the collaborator of Francis Galton, Karl Pearson, and Sidney Webb.

A sharp distinction, however, can be drawn between the aim that animates the work of the professional sociologists and the spirit we find in the literary artist's sketches. To the former the chief concern in this peril of the "degeneration" of England's urban inhabitants is broadly political and broadly biological. If the class of the unemployed continues to increase, if drunkenness and malnutrition remain unchecked, if no restraints are imposed on the employment of children and of mothers—what will become of the splendid English stock, and what will become of the British Empire? If the poorer classes continue to exhibit an appallingly high birth rate, while the comfortable and well-to-do persist in regulating propagation in accordance with the fluctuations of the income tax—what is to prevent England from speedily following in the footsteps of Rome? In "Demos" and "Old Age," on the other hand, we find anxiety and pity for the evil which is of the day, and the implied obligation on the part of society to cling to the rule formulated by the old man of Königsberg and to treat the Poplar seamstress or the West Ham coal-heaver as something of an end in themselves, to the exclusion of even such sonorous ideals as "race-cultivation" and "national supremacy."

If we are to take just the cold-blooded evolutionary or political standpoint, with regard to this entire question of proletarian race-swarming *versus* aristocratic race-suicide, it is not impossible to maintain that the evil of the situation has been unduly magnified. When we deplore the fact that the "best" elements should consciously restrict their own growth, while the "worst" elements multiply even as the sands of the sea, are we not really putting the cart before the horse? In arguing that improvident parenthood is responsible for poverty, we are only stating that the "worst" are the "worst" because of their multiplicity, and that the "best" hold their high place because of their carefully restricted numbers. Under present economic conditions, if by some miracle the birth-rate in London's East End should suddenly be cut in three and the birth-rate at the West End be trebled, it would only mean, in the course of time, a shifting of the slum district from Whitechapel to Grosvenor Square.

Still from the same cold-blooded point of view, it may be argued that an enormous amount of human wastage is not necessarily inimical to the progress of the race; at least, we have grown accustomed to nature's expensive method of perfection-building, and the English student of evolution should regard with equanimity the development of an industrial slave population as the base on which British culture may rise to the heights of Greek civilization. As for national rivalry, here, too, it remains to be proved that a highly developed class-conscious oligarchy, backed by a submissive populace placated by various democratic fictions, could not hold its own against a better-fed nation led by inferior intelligence. Somehow Rome managed to struggle on for five or six hundred years after its inhabitants had become a mob of foreign public beggars. Add to this the important consideration that a parallel process is at work all over the world, and that, if Britain's undesirables grow fast, so do those of her possible competitors.

So we come back to what we have called—perhaps with too much emphasis—the Galsworthian point of view. As a matter of fact, it is unfair to draw a sharp distinction between humanitarians and scientific sociologists. Mr. Sidney Webb is not a notorious grinder of the faces of the poor, and possibly, with full knowledge of his British public's distaste for the abstract, in charity, as well as in everything else, he has been fooling it cleverly by telling England that, if it doesn't watch out, Germany will get it. His remedial suggestions certainly show no absence of a desire to cope with present needs on an extensive scale. Our point is directed only against the danger of over-emphasizing the scientific aspect of the problem. To lessen the present burden of human suffering is still quite as adequate a formula as any that has been set up, but it has become unfashionable. To speak of "eugenics" and the "endowment of motherhood" is strictly up to date; but, if you mention the hackneyed word "philanthropy," G. B. S. comes out and hits you with his shillelah.

THE STRUGGLE FOR—AN EXCUSE.

The assumption that the feverish haste of modern life is due to a forced "struggle for existence" is wholly unwarranted, so far as its general application is concerned. It is true that present-day organization has made it less easy than of old for the man of moderate means to conduct certain lines of business on an independent and fairly remunerative basis. It is not true, however, that the type of man who could do this in the past cannot find some form of equally profitable effort to-day. Doubtless, the college professor now receives but meagre pay in proportion to his services, but he has no hankering for a return of the time, not yet remote, when college presidents were serving for smaller salaries than the lower ranks of instructors in respectable institutions now get. The public in general sympathized with the women teachers of this city in their attempt to secure the same pay as men for equal work; but many of the petitioners are now paid higher salaries than the average male city superintendent commanded at a period within the memory of men not yet superannuated.

It is not the struggle for *existence* which is hurrying the human procession on at a pace beyond the limit of healthful endurance, but for existence upon some predetermined level, equal to or above that of others who are steadily held before the mind's eye as a standard of comparison. Smith starts with a competence, but ends in bankruptcy as a result, not of the fierce struggle for existence, but of the effort to maintain a seaside summer cottage and an automobile, as does his neighbor, Mr. Jones. His father went to Ohio penniless in the thirties, took up a farm, and died twenty-five years ago a wealthy man, not because the struggle was easier then, but because he shod his own work horses, mended his own boots, ate and wore the products of his own fields, and solaced his ear with the hum of the loom and not the piano. Had he endeavored to satisfy the more varied and expensive tastes now prevalent, disaster would have been the inevitable outcome.

Our colleges and universities are filled with the idea that short-cuts to degrees must be devised, so that the graduate may plunge earlier into the desperate struggle. Formerly there was time for a four years' cultural course, with full professional studies to follow. Now, we are told, this is impossible. Either by telescoping or by shortening, a year or two must be saved, if the boy is to have any chance. Any chance for what? So far as business success is concerned, it is a simple fact that college graduates who have brains and energy are working their way into lucrative employment with more ease to-day than at any previous period in the nation's history. If in certain lines where other qualities than shrewdness and push are important the comparison is possibly less favorable, it is imaginable that the difficulty lies in too brief a period of preparation for the demands of the age, rather than too extended. The theory of an Osler may do for the exceptional man of genius, but when it comes to the average, the world is suffering more from the rawness of men under forty who have never been sufficiently trained for the work they are trying to do, than from the incipient senility of really well-disciplined men between forty and sixty.

It is useless to attempt to convince the participants in the struggle that its ends are in general not worth so severe an effort. The *aurea mediocritas* is just the one thing of gold for which the gold-seeker can find no use in his business. Men who are not themselves carried beyond the point of reason, however, should not lend their weight to the fallacy that the present age, in addition to its accumulation of very real evils, is especially characterized by increasing difficulty in the struggle for *existence*. From the highest to the lowest, such a conception is radically at variance with the plain facts.

The dispute turns very largely upon the distinction made by Socrates. In the well-known dialogue where he was picturing the ideal simplicity of life, some one broke in with the objection that boughs to lie upon and the home-made loaf would not satisfy all. "Ah, I see," remarked Socrates, "it is not life that you are discussing, but luxurious life." No doubt, if men are to pitch their expectations by an ever increasing standard of luxury, its attainment will be increasingly difficult. That, however, is no more true to-day than it was in the time of Socrates.

THE OXFORD PAGEANT.

BALLIOL COLLEGE, July 4.

The Oxford pageant, enacted yesterday afternoon for the last time, has for several months past occupied the minds of Town and Gown alike. How modern a thing is this union of hearts in an enterprise requiring coöperation between the university and the city is brought home to us by one of the chief episodes enacted—the fatal town and gown riot of St. Scholastica's Day, 1354. How real has been the coöperation of all estates of men in this pageant could be seen at any time during these last six weeks and more by a glance at the thoroughfares of this ancient university seat.

Inured from of old to the scarlet silks and brocades which diversify doctors processions at the Encænia and at certain of the weekly university sermons, the streets of Oxford have lent themselves with a good grace during the last month and a half to the motley of throngs more brilliantly variegated than those of any carnival, whether Venetian, Roman, or Parisian. Angles in skins have jostled Puritan Ironsides in leather and feathers at the four corners of Carfax. Helmeted Normans, armed to the teeth, have flashed down Holywell and smoked briarwood pipes while clangorously bestriding bicycles down Long Wall Street. All the country roads leading into Oxford have been choked with thronging cavaliers on gallant chargers, with streaming locks and fluttering cloaks of red or green, purple or blue, making haste to their rendezvous with the martyred Charles on the playground of Magdalen College School. Queens, pages, squires, and court ladies of many generations have swarmed over Magdalen Bridge; Mercian nuns, archbishops, earls, cardinals, friars, black and white, have become a drug in the market; and the motley crowd of the

fair, into the midst of which arrived George III. to the accompaniment of Handel's Water music—the closing muster of the pageant—has more than once quite crowded to the wall in Oxford streets the few miserable beings still wearing the too sober livery of to-day.

A distinguished archæologist, bent on the Ashmolean Museum and all unconscious of the local pageant, alighted here yesterday from Berlin. He was thunderstruck by the first thing he saw on leaving the station—a full-fledged courtier of Henry the VIII. dashing along on a motor bicycle with a cigarette in his mouth, and not a soul heeding him. Truly, a haven for the archæologist, this Oxford, where the man in the street is prepared for any apparition from the past that may present itself.

The pageant, then, made the gallantry of mediæval costume, the court dress of Elizabeth, and the finery of the Stuart levees and progresses a common matter in Oxford. All classes were familiar with it all, because all kinds of people took part. This gave to the actual scenes—parades, court functions, processions, progresses, and the like, all of them bringing in crowds of people—a charm of variety and reality difficult to find in similar scenes as commonly set on the stage. Mr. Lascelles, the indefatigable master of the pageant, overcame many difficulties, but did not have to contend with the hopelessly monotonous vulgarity of stage supernumeraries. In his skilfully marshalled groups and scenes all were stars, and there were no supernumeraries. Speaking generally, the purely mechanical conventions of the contemporary stage were more honored in the breach than in the observance. The grotesquery of the ordinary make-up for the footlights had to be mitigated for performers whose background was natural foliage and the open sky, and whose illumination was daylight pure and simple. Open-air performance favors, on the whole, a certain spontaneity and a return from conventionality to naturalness. Stage management did, however, most emphatically come into successful play in timing the various scenes. Although the whole representation lasted from four to seven, the time was well filled and there were no waits. This was constantly attended to, along with the grouping of colors and masses, by the master of the pageant, whose megaphone, audible among the *figurants* and *figurantes* of the meadow, could not be heard by the audience. He was on the roof of the grand stand wherein they were seated.

One of the much discussed dramatic unities, and one only, imposed itself on the sixteen events or parts of the whole representation. Each and all had to take place on the meadow overlooked by Magdalen tower, and surrounded by arms of the Cherwell. Here is the playing ground of Magdalen College School, where was bred J. R. Green, whose "History of the English People" is in some sort a protest against the undue importance commonly attached by historians to kings, courts, ceremonials, and battles. It is a striking and not wholly encouraging commentary on Green's ideas to find, in looking through the events chosen to illustrate Oxford history, that kings and courts and battles occupy the stage so constantly that very little space can be allotted to specifically University events, even in what is primarily a review of the history of a University town. Primeval and mediæval Oxford were represented by six events, Oxford since the Renaissance by nine. Of all these numbers, six only dealt with specifically academic events. The first of these, in which Mr. Bridges dramatizes the arrival at Oxford of Theobaldus Stampensis, is so obviously undramatic, that it might advantageously have been dispensed with. Next comes Mr. Oman's farcical episode of Roger Bacon, and the brazen head, an amplification of a well-known Elizabethan extravaganza. This travesty of mediæval learning has at least the merit of furnishing the occasion for Mr. Tovey's remarkable skit on Richard Strauss. Mr. Tovey's title is "Also sprach die reine Vernunft," and the musical extravaganza well assorts with the oracles of Friar Bacon, but neither the music nor the fun so much as hints that Friar Bacon played a great part in the progress of learning at Oxford.

The third academic scene is the riot on St. Scholastica's day—dramatized most effectively in Mr. Godley's dialogue. Fighting and carnage always command attention irrespective of the intellectual attainments of the heads that are broken. The scene between Wolsey and Henry VIII. brings in the foundation of Cardinal College episodically; the real dramatic interest concerns first Catharine, Henry VIII., and Anne Bullen, and then the delightful allegory performed for their diversion. The same is true of Sir Thomas Bodley's foundation, most skilfully wrought into the fifth academic episode, where Miss Wordsworth inimitably introduces King Jamie and Lord Bacon animadverting upon the dramatic improprieties and exuberance of poor Shakespeare, who just manages to keep his temper until these great people pass off the scene, and certainly monopolizes the dramatic interest. The attraction of the sixth academic episode, James II.'s expulsion of the fellows of Magdalen, certainly centred in politics.

Thus the only one of these six episodes which ought to be most interesting, since it contains nothing of courts, of battles, or of royal ceremonial, has turned out to be the only one that proved unsuitably dull for the pageant. This certainly shows that the Consultative Committee were wise in running counter to J. R. Green's general view. Fascinating in its results as worked out by the historian, Green's notion of neglecting the pomps and victories of history, the finery of courts and the carnage of battlefields, plainly has no scope in the plan of a pageant. But the committee would have failed had they been content to make plain at Oxford that purely academic facts and interests cannot be made interesting in dramatic representation. They were therefore most happily inspired when they accepted from Professor Raleigh their wonderful Interlude—"The Masque of the Mediæval Curriculum." This most uniquely fascinating poem made of the Oxford Pageant, a new departure of interest alike to the historian of literature and of the stage.

It is an open secret that this imaginative projection of the mediæval spirit into a series of wonderful tableaux, with accompanying poetical exegesis, is largely, indeed so far as the poetry goes chiefly, the work of Mr. Markoe, lately of Harvard University, and now of Magdalen College, Oxford. Prof. Walter Raleigh has insisted upon this fact, although the general conception of the masque owes so much to Raleigh himself that it figured in connection with his name.

Indeed, the exquisite literary charm of this masque was but one of the many graces that adorned it. Such were its beauties of detail that only a general impression can be given. Pleasure and her train vie with Divinity hedged around by the liberal arts of the Trivium and Quadrivium, for the allegiance of the wise student and the foolish one. The difficulty of the choice was shared by every onlooker. On the whole, Pleasure floated around us practically irresistible, although the wise student's choice of Divinity and her austere attendants was just momentarily conceivable, but not when we were confronted by "Bacchus and his lustful throng, mingling their ribald jests with drunken song." This merry tableaux won the enthusiastic admiration of all beholders.

In his Bacchanalian throng and in the Allegory performed before Henry VIII. and Queen Catherine—where bees and ants swarm from the Castle of Industry, whence issues the slayer of the dragon Ignorance—the small fry of Oxford figured with such effect as to justify the common saying that young children always take on their best looks in the otherwise much maligned Oxford climate. Among the scenes unaccompanied with dialogue, a very striking one was the Coronation of Harold Harefoot (1036), where was introduced, with thrilling beauty of effect, the actual plainsong known to have been sung on the occasion. The funeral of Amy Robsart was equally effective, and more minutely correct, because so much more detailed information is available, and because Lord Dillon's knowledge was exhaustive. Here Mr. Donald Tovey's polyphonic movement for four trombones came in to show how much music can achieve if a composer frankly subdues his hand to that in which it is called on to work. This masterpiece of pageant accompaniment is likely to figure on concert programmes in the future.

The sombre funereal note was taken up in a later scene by the weirdly melancholy Pavane—one of Lully's—played for the ladies whose graceful evolutions were the entertainment offered by Laud to his king just arrived. Costumes, grouping, and landscape all melted into one delightful harmony in the three Stuart scenes. Oxford always belongs to Charles the First, and Charles the First to Oxford—a fact to which our own Longfellow was most keenly alive. On the present occasion Charles would have been the more at ease because of the "make-up" of his host, the Vice-Chancellor Laud. Among many happy hits this reincarnation of Laud, which was the well-known Bodleian portrait to absolute perfection, ranks foremost. The King himself would have been deceived, but would hardly have understood if it had afterwards been explained that the impersonator of Laud was Mr. Clark Tandy of Exeter College. So far he would have followed; but what would he have thought when he heard it added that Mr. Tandy was a Rhodes scholar from Kentucky? The putative emotions of the martyred King may perhaps some day be recorded by Samuel Clemens, Esq., Hon. Litt.D., Oxford, who twice attended the pageant with

increasing enthusiasm and was twice the recipient of an ovation from the spectators, all of whom evidently shared Lord Curzon's admiration for our inimitable compatriot.

LOUIS DYER.

NEWS FOR BIBLIOPHILES.

There has just been published the first volume (covering A to E) of a new bibliographical work with the rather imposing title: "The Bibliographer's Manual of American History. Containing an account of all State, Territory, Town and County Histories Relating to the United States of North America." It is compiled by Dr. Thomas Lindsey Bradford, and edited and published by Stan. V. Henkels, the Philadelphia auctioneer, through whose hands pass annually so many rare and important books.

To criticise a work of this sort is easy, but to prepare any extended bibliography and have it free from errors or omissions is impossible. The transcripts of titles of most of the books are full, and collations are generally given. The modern bibliographer demands fuller collations than are given in the older works, and Dr. Bradford in many cases has furnished these. In this respect, however, the work is very uneven. For example, the collation of Alsop's "Character of the Province of Maryland," 1666, one of the rarest of books, is given as "10 p. l., pp. 118. Portrait and Map," while the 1902 reprint of the book has a page-by-page collation filling fourteen lines. It is a pity also that more of the notes are not original. With a few exceptions they are quoted, and this largely from Rich, Field, Stevens, Thomson, and Sabin, whose notes, though admirable at the time, are now in many cases antiquated. The auction sale records are in some cases very full, but are set "solid," and the arrangement is haphazard. In some cases sale records of many years ago only are given. Only one record (Brinley, 1880, $56) is given for Bonoeil's book on Silkworms in Virginia, "His Majestie's Gracious Letter," etc., 1622, but there are two important recent records, McKee, 1902, $260, and Lefferts, 1902, £67. Only one record of sale is given for John Eliot's "Tears of Repentance," 1653, that of $100 paid for Rice's copy in March, 1870. This same copy has since been resold twice (in the Menzies and Griswold sales), and other copies were sold in the Brinley, Barlow, Ives, Deane, and other sales. No record of sale is given for Eliot's "Brief Narrative," 1671, though several copies have been sold at auction. Other similar omissions of this sort might be pointed out. On the other hand, records of sales of moderately-priced books which do not find a place in "Book-Prices Current" are entered in many cases. For the average collector, bookseller, or librarian it is sometimes just as important to find that a book is worth only twenty-five cents, as to find that it is worth as many dollars.

Omissions are likely to be discovered by use. Local items are, in the nature of the case, often difficult to trace. Sir William Alexander's "Map and Description of New England," 1630, is included, but the earlier issue of the same book with a different title "An Encouragement to Colonies," 1624, is omitted. The title of the first edition of Breton's "Briefe and True Relation," 1602, is given, but the collation is that of the second edition of the same year. The first edition, interesting as being the first printed account of any voyage of Englishmen to the shores of New England, contains twelve leaves only, signatures A., B., and C., each four leaves. The second edition has twenty-four leaves, with a different title containing the words: "With divers instructions of special moment newly added"; in this second impression, Colden's "History of the Five Indian Nations," 1727, as well as Shea's reprint of it made in 1866, are included, but the only other edition mentioned had simply the entry "The Same, London: 1747." As a matter of fact, the London edition is not by any means the same as that of 1727, but includes much additional matter. Sabin describes also editions of 1750 (some copies without date) and 1755, the latter in two volumes.

Of the many editions of the "Navigator," ascribed to Zadok Cramer, the earliest described is the fifth edition, 1806, and nothing has been added to Sabin's and Thomson's account except a few more recent sale records. The third edition, printed by John Scull in Pittsburgh, in 1802, has the title: "The Ohio and Mississippi Navigator Comprising an Ample Account of those Beautiful Rivers, from the Head of the Former to the Mouth of the Latter." No copies of the first or second editions seem to be traceable.

An exhaustive index by titles and an index by States are promised at the conclusion of the work, and will form the fifth volume. This index will make the information in the work accessible to the local collector and librarian, and render it practically indispensable to the collector of local histories.

Correspondence.

THE POSITION OF PROFESSOR HARNACK.

TO THE EDITOR OF THE NATION:

SIR: A note in the *Nation* of July 11 very properly calls attention to the recent noteworthy productions of Professor Harnack in the field of New Testament criticism. The mention of "conservative results," however, and of the "historical credibility of the book" (*i. e.*, the Acts of the Apostles), may prove misleading to some as to the actual position of the Berlin savant in regard to the trustworthiness of the writings ascribed to Luke. It is true that Harnack, in "Lukas der Arzt" (Leipzig: 1906), and in more recent articles, argues strenuously for the Lukan authorship of the entire book of Acts, as well as of the third Gospel, and thus antagonizes many critics who have held that the later chapters of the Acts, especially the "we-sections," were from another hand than the earlier chapters, and that the tradition ascribing both history and Gospel to the physician Luke, the companion of Paul, is untenable. It is true also that he pleads for a larger measure of credence for the Lukan writings in general than have been recently accorded them, *e. g.*, by Clemen, Jülicher, and Weizsächer. But, on the other hand, no careful reader of Harnack could make him sponsor for what are commonly known as the traditional opinions concerning these portions of the New Testament, nor will any one who desires to place confidence in Luke as an historian find much to his liking in Harnack's pages. While praising the smoothness and graphic picturesqueness of Luke's style, Harnack asserts that Luke proceeds in chapter after chapter with great carelessness as to facts, and that he frequently is entirely misleading. This holds good, Harnack maintains, for the Gospel as well as for the Acts, and for the second part of the Acts as well as for the first (p. 80). He asserts that Luke's picture of the primitive Church in Jerusalem leaves much to be desired in point of clearness and credibility (p. 88). Paul's attitude toward the decree of the Apostolic council can not have been that recorded in Acts 15, and subsequent chapters (p. 91). Luke has exaggerated the friendliness of the Roman Government toward the new religion, and treated Pilate with more than justifiable leniency (p. 96). Moreover, the conception of the Christian salvation which obtains in both Gospels and Acts is, according to Harnack, extremely deficient: Luke seems to conceive Jesus as a supernatural medicine-man and exorcist, and to regard miracle healing as the proper function and real test of the new faith (p. 100). Further, this physician-author is described as a "Christian Science" practitioner (the English phrase is used), and compensating characteristics are sought for his magic, his colossal credulity, his theological superficiality, and his genuinely Greek fondness for fabulating (p. 116).

It is true that Harnack discovers compensating merits in Luke in abundance, and that he describes with enthusiasm his worth as an historian. The above extracts give a very one-sided notion of the portrayal of Luke in "Lukas der Arzt." They are nevertheless necessary to a fair judgment on Harnack's position as a New Testament critic, and they indicate with sufficient force how far his recent publications are from supporting the traditional position, as that is commonly understood. When the views of the Berlin professor are taken as a whole, it is probable that few would care to claim them as "conservative results."

The misunderstanding is due, doubtless, to Harnack's peculiar use of the word "tradition" in some of his clear, ringing sentences. He has a fondness for "tradition" in the sense of ecclesiastical and patristic reminiscences of persons and places, authors and sites, connected with early Church history, together with a remarkable genius for seeming to prove the correctness of many of these early opinions. With him a "return to tradition" means a return to the very early opinion that the author of the Acts was the physician Luke, and that the fourth Gospel was written by a man by the name of John in Ephesus, but he does not mean by it a return to the unquestioned opinion of 200 years ago, that the Acts contains a reliable portrayal of the personality of Paul, or that the Gospel of John is of equal value as an historical document with the Gospel of Mark.

Mistaken conclusions of this sort are the less excusable since the same blunder was made ten years ago, and corrected. Referring to that error, and in anticipation,

it should seem, of such misapprehensions as might arise from the note in the *Nation*, Harnack wrote in the preface to the work on Luke under discussion:

Ich sah mich plötzlich zum Zeugen dafür gemacht, dass wir uns in der *Sachkritik* in einer rückläufigen Bewegung befänden. Für dieses Missverständniss bin ich nicht verantwortlich, ja ich habe mich in jener Vorrede im voraus gegen dasselbe geschützt; es hat aber nichts geholfen. So sei denn jetzt ausdrücklich ausgesprochen, dass in der *Sachkritik* viele überlieferte Positionen m. E. immer unhaltbarer erscheinen und überraschenden Erkentnissen Platz machen müssen.

JOHN M. THOMAS.

East Orange, N. J., July 19.

DEFACING PROPERTY.

TO THE EDITOR OF THE NATION:

SIR: Ever since the newspapers noticed the action of the House of Commons prohibiting the defacing of scenery by advertisements, I have been wondering how the fundamental law of private property in England makes such an enactment possible.

Your editorial in the *Nation* of June 20 leads me to ask if you can suggest how we can as a nation, State, or city, "imitate" England in prohibiting the defacements on property owned by private individuals. We have, in this State, a law which protects State property from defacement, but diligent search has failed to show me a constitutional and lawful way to stop advertisements on private property. We have a city ordinance forbidding painting advertisements on the walls of buildings, but attorneys for property owners easily showed our city attorney that such an ordinance was unconstitutional. One of the glories of Colorado is her scenery, and you will win her gratitude if you can point out a method of saving it from advertising vandals.

A year ago or so, there was a warm exchange of compliments between the editor (I think) of the New York *Times* and the editor of the Hartford *Courant* over an enormous disfiguring whiskey advertisement, which from the wall of an adjoining building glared a welcome to all passengers alighting at the Hartford depot, but the *non possumus* of the Hartford authorities seemed well based in the constitutional provisions of the State.

Practically, the question is: Can police power be extended to æsthetics, and if so, how, and how far?

Much as I personally detest the advertisement on bill boards on empty lots or on the walls of private buildings, I see no way to forbid it without opening the door to saying how one shall shape and color one's house, or cut one's hair.

The Supreme Court of the United States went, so it seems to me, unduly far recently in supporting a Wyoming law declaring a certain thing to be a nuisance. What is a nuisance is not a matter for legislative enactment, but for determination of a court; and public health, morals, and safety, and not æstheticism, must remain the touchstone.

Pardon the length of this letter. The matter is of growing importance. I have had the misfortune to be retained in successful opposition to the enforcement of æsthetic laws, but I am keenly desirous of "finding a way" for reasonable and safe restraint of vandals.

CHAS. W. HAINES.

Colorado Springs, Col., July 1.

THE PRESIDENTS OF WILLIAMS.

TO THE EDITOR OF THE NATION:

SIR: The election of Professor Garfield to the presidency of Williams College does not involve so great a departure from precedent as your interesting note of July 11 suggests.

The first three presidents were regular clergymen. The fourth, the venerated Mark Hopkins, though he became a great preacher, never studied for the ministry, but took a full course in medicine before accepting the professorship of moral philosophy in the college, and was licensed to preach while occupying that chair, three years before his election as president.

His successor, President Chadbourne (1872-81), was in no sense a clergyman, but always a student and teacher of natural history. He also became a frequent and vigorous college preacher, but had no theological education, and was never ordained. I still have his letter, written during my student days, in which he says, with reference to a proposed sketch of his life: "Please remember that while I am a D.D., I am *not* a Reverend."

President Carter (1881-1901) was a teacher of languages—French and Latin at Williams; German at Yale—and had no clerical relations of any sort when chosen to the presidency. He gave the baccalaureate sermon regularly during his incumbency, and may have been ordained after his election, though I have no certain knowledge on this point.

It is true, as you say, that both Dr. Chadbourne and Dr. Carter taught semi-theological subjects—natural theology, theism, etc.—and no doubt these subjects were deemed especially appropriate for the president, especially since they would not occupy his entire time. But the truth appears to be that Williams was one of the early colleges to elect non-clerical presidents, and that the requisites for the office have always been, as now, scholarship, administrative ability, and definite Christian character and ideals, without reference to technical ministerial standing. C. S. H.

Chicago, July 13.

[In spite of the facts which our correspondent cites, we feel that the election of Professor Garfield will be generally, and justly, regarded as a break in clerical tradition. We by no means intended to convey the impression that all former presidents of Williams had been pastors of churches.—ED. NATION.]

WARNING AGAINST AN IMPOSTOR.

TO THE EDITOR OF THE NATION:

SIR: Readers of the *Nation* should be warned against the advances of an impostor, who pretends to be an expert in classical archæology, and is travelling from city to city endeavoring to procure assistance under various pretexts. In some places he represents himself as Prof. August Mau, and shows a copy of "Pompeii: Its Life and Art" as his work; elsewhere, meeting those who know Professor Mau personally, he gives the name of Alexander Mau, and claims to be a nephew of the Pompeiian archæologist. He is described as about five feet and six or seven inches in height, and as wearing a moustache, with a small goatee; he is intelligent and well dressed, and speaks with a strong German accent.

FRANCIS W. KELSEY.

University of Michigan, July 15.

Notes.

We have seen no more interesting announcement than that the Dictionary of National Biography is to be reissued in cheaper form. The present 66 volumes are to be made up into 22. The type will remain the same, but the paper, we presume, will be thinner. The publication will probably begin next year.

In the autumn the Macmillan Company will begin the publication of an English translation of Alexandre Dumas's Memoirs. The whole work, in six volumes, is full of interesting pictures and anecdotes of French literary life.

The same house will soon issue a volume of sermons by the Rev. R. J. Campbell, author of "The New Theology."

Baedeker's "Southern France, Including Corsica," appears in a fifth edition. Imported by Chas. Scribner's Sons.

G. P. Putnam's Sons will bring out early in the autumn a new volume of essays by Stopford A. Brooke, entitled "Studies of Poetry." Another book of the same class to be published by Putnams is R. A. Willmott's "Pleasures of Literature."

Alfred Nutt is preparing a uniform edition of the best of W. E. Henley's writings.

Edward Thomas, who is writing a life of Richard Jefferies, requests that papers or letters bearing on the subject may be sent to him at Berryfield Cottage, Ashford, Petersfield, Eng.

Though "Arctic Number" is the sub-title of the *National Geographic Magazine* for July, the opening article is the recent address of Secretary Taft, at St. Louis, on our efforts to aid the peoples of Cuba, Porto Rico, and the Philippines. This is followed by an account of a cruise last summer in the Arctic by Max Fleischman, in which an attempt to reach the east shore of Greenland failed on account of the ice. There is also given the substance of Commander Peary's address to the National Geographic Society describing his latest explorations, together with a record of his previous services taken from Major-Gen. Greely's "Handbook of Arctic Discoveries." A brief sketch of Spitzbergen, now known as "No Man's Land," Norway and Sweden being unable to agree as to its possession, contains the suggestion that some power should assume authority over the archipelago, for the game—reindeer, polar bears, ptarmigan, geese, ducks, and other birds, formerly so plentiful—is being wantonly exterminated. A party of tourists last summer killed more than one hundred reindeer, leaving the carcasses where they fell, and taking with them only a few of the finest heads and antlers. The picture feature of the number consists of reproduc-

tions of photographs illustrating a list of Arctic expeditions commanded by Americans, beginning with that of Lieut. De Haven in search of Franklin.

The most significant of the contents of the *Geographical Journal* for July is Geo. G. Chisholm's inquiry as to the influence of geographical conditions on rail and water transport. It is full of suggestive facts and statistics in regard to transportation on the inland waterways of Germany, England, and America, with several sketch-maps and designs. Of equal value was the discussion on the subject by leading members of the society, the general trend of which was against government built or aided canals in England. Among the important facts brought out were the substantial diminution of waterway transport in the United States, and that England was behind other nations in the matter of cheap carriage. As an illustration of this the chief engineer of the Manchester Ship Canal, H. Hunter, said that in 1904 some crates of pottery, intended for London, were sent by mistake from Tunstall to New York and from thence to London, at a cost of 15s. per ton. The railway carriage direct was 25s. per ton, "so that it may be said that the cheapest route from Tunstall to London is via New York." An interesting communication from Dr. Stein gives the main results of his expedition in Central Asia up to last February. Among his finds in the ruins are more than 1,300 Tibetan records on wood and paper, many of them as early as the first centuries of our era, as well as fine frescoes and paintings "remarkable for clever adaptation of classical forms to Indian subjects and ideas." A very interesting excavation was that of a house of a "local official, who, besides leaving files of papers, *i. e.*, tablets, scattered on the floor of his office room, had taken care to hide a small archive, undoubtedly documents of value, below one of its walls. From the way in which the place of deposit was contrived and marked, it appears probable that the house was abandoned in some emergency. All the deeds, etc., found here still retain their original wooden covers and string fastenings, in perfect condition. Among the dozens of intact clay seals which attest these documents, impressions from Græco-Roman intaglios prevail," testifying to the early cultural interchange between the classical West and the Far East.

It is a remarkable evidence of the abiding influence of Prof. Albert Socin of Leipzig, the most famous pupil and the successor of the still more famous H. L. Fleischer, that now, fully eight years after the departure of Socin, his pupils and friends have established, under the auspices of the Saxon Royal Society, an Albert Socin Stiftung, which stipendium will furnish every three years the sum of eighteen hundred marks to some young graduate of the theological or philosophical faculty to go to the Orient and there engage in linguistic, literary, and ethnological research in the Arabic speaking lands, especially in Syria and Palestine.

A comely and useful book is "Cobden as a Citizen," by William E. A. Axon (A. Wessels Co.). The author found his provocation in the discovery of a copy of Cobden's long-lost pamphlet, "Incorporate your Borough." Though 5,000 copies of it were printed in 1838, not a single surviving one had rewarded the search of collectors and delvers in the local lore of Manchester. Among some family papers, a specimen finally turned up, and its reprinting has given Mr. Axon occasion for writing a chapter in Manchester municipal history. The obsolete fashion in which that city was ruled before the charter was at last granted, is faithfully and amusingly set forth, and Cobden's part in the struggle for reform is entertainingly told. A long and presumably exhaustive Cobden bibliography, together with the reproduction of an early painting of the great reformer and a view of his last residence in Manchester, rounds out a little volume which all admirers and students of Cobden will desire to possess.

T. E. Kebbel is a veteran English journalist, and his "Lord Beaconsfield, and other Tory Memories," (New York: Mitchell Kennerley), is rather thin-spun "copy." With none of the statesmen and noblemen whom he here touches upon did he pretend to have any especial intimacy. He met them socially, at intervals, and brought, or sought from them, the news and opinions about which it was his duty as a party newspaper man to write. In reality, we learn more of Mr. Kebbel, his prejudices and convictions, his services and experiences, than we do of the men whom he undertakes to portray. The author stands revealed as the truest-blue Tory that ever lived, lamenting even the reforms of 1832, and with the blunted sense of humor which goes with that character. Some of the samples he offers of aristocratic wit are rather terrifying. His "Tory Ladies," in particular, appal one by their brilliancy. There was the "amusing" Lady Victoria, daughter of the Duke of Rutland. "'Here's a gentleman,' said the Duke, 'who says he remembers you at Belvoir.' 'Oh, does he!' was the reply." There are many pages of this sort of overwhelming repartee. Still, the book has a good deal of lightly entertaining political and personal gossip, which might while away an idle hour.

"In the Days of Goldsmith" (A. S. Barnes & Co.), by Tudor Jenks, is a compilation from the longer biographies of the poet. It is carelessly written, as though Mr. Jenks thought that the proprieties of grammar would be thrown away on the young and the little-read, whom he addresses. "In the year 1763," he writes on p. 158, "occurred an event that may not have interested literary London, but one that was to affect many great interests in the future, was the invention of the spinning-jenny." Among the "historical events of 1762" he places the death of George IV., and writes "Tunbury Wells" for Tunbridge Wells. As an example of his vague manner, we may quote his description of Goldsmith's birthplace, Pallas, in Ireland. He omits the name of the county, and is content with the statement that "speaking generally, it may be said that this locality is about the middle of the country." Altogether the volume is a good example of hasty book-making.

A volume of sermons by the late Phillips Brooks, translated into German by R. Bolt, is meeting with favorable reception. The discourses are admired for their depth and wealth of thought, their beautiful form, chosen but never sought, and for their union of logical clearness with warmth of feeling. The different conditions as to church attendance which prevail in Germany, as well as the different conceptions of preaching, are seen in the fact that these sermons are pronounced "too high" for the German church-going public. The German pastor still preaches to the *Bauer*, and has no very high regard for his auditor's intellectual capacity. The frankness and boldness of Brooks, and his evident desire to bring before his congregation his intellectual best, strike the German readers of his sermons with no little astonishment. The sermon on the "Light of the World," well known to American readers, seems to attract special attention. Professor Peabody writes a commendatory introduction for the volume, which bears the striking title, "Ein Ruf in die Höhe" (Berlin: Martin Warneck).

The Rev. Samuel Gardiner Ayres, librarian of the Drew Theological Seminary, has prepared a bibliography of more than 5,000 titles in English on the Life of Christ and various topics connected with the teaching and work of Jesus ("Jesus Christ Our Lord," A. C. Armstrong & Son). The volumes are classified under such headings as the Preëxistence of Christ, Christ in the Old Testament, Christ Incarnate, His Birth, The Virgin Birth, etc. A complete subject index, as well as an index of authors, enables the reader to find all the material on a given sub-topic, as well as the complete works of a given author on the general subject. Brief annotations indicate the character and standpoint of a large number of the volumes mentioned. As far as it goes, this bibliography is valuable, but, of course, for the modern student the limitation to works in English, save the few that have been translated, seriously affects its usefulness.

The third volume of the "Original Narratives of Early American History," which deals with Spanish exploration in the Southern United States from 1528 to 1543, is the second volume of the series in order of chronology. It contains three narratives selected from the many scores of similar relations. The first, by Alva Nuñez Cabeza de Vaca, of a journey from Florida to the Gulf of California, and the third, by Pedro de Castañeda of Coronado's expedition, are edited by Frederick W. Hodge of the Bureau of American Ethnology. The second, by the Gentleman of Elvas, of De Soto's expedition through the Gulf States to the Mississippi, is edited by Theodore Hayes Lewis, the archæologist. Accompanying the narratives are two maps—a contemporary drawing of the area of De Soto's wanderings, and a chart of Coronado's movements, especially drawn for this volume under Mr. Hodge's supervision—and a facsimile of the title page of Cabeza de Vaca's "Relacion." By reason of his familiarity with the aboriginal archæology of the Southwest, Mr. Hodge is admirably fitted to cope with the difficult problems raised in Cabeza de Vaca's narrative, and after George Parker Winship, whose translation has been used here, is the leading expert on Coronado's expedition, having written an important monograph on the subject in 1899. Mr. Lewis, whose life has been largely devoted to archæological investigations in the Northwestern and Southern States, is no less an authority, and has already given

time and attention to the route followed by De Soto and his companions. It is somewhat to be regretted that neither Mr. Hodge nor Mr. Lewis has thought best to attempt maps of the routes taken by Cabeza de Vaca, and De Soto, for the reader would find his interest in the volume considerably increased by knowing somewhat exactly the possible or probable course of their wanderings. Nevertheless, the volume is of great interest in itself, and furnishes the best possible introduction to a further study of the large and intricate problem of Spanish explorations in America. (Scribners.)

Blätter für Volksbibliotheken und Lesehallen (Leipzig: Harrassowitz) quite frequently contains articles of interest to others than librarians. Even the papers concerned with professional topics deal less with technical details than with questions of management and are mostly of a descriptive and historical nature, such as C. Lansberg's article on the possibility of joining savings banks and public libraries, or J. Hanauer's "Experiences and Propositions for Music Libraries." But in addition to such papers nearly every number offers a sketch of some more or less well-known author, considered as "Volksschriftsteller," that is, as an author whose writings commend him to that class of hard-working men and women who still retain an interest in the best in literature, a class more numerous in Germany than perhaps in any other country. The double number for May and June of this year thus offers a short memorial sketch of the late Adolf Stern, by the editor, Prof. E. Liesegang in Wiesbaden. Stern was, as is well known, chiefly a critic and literary historian whose "Deutsche Nationalliteratur von Goethes Tod bis zur Gegenwart" is one of the best, if not the best, guide to modern German literature. In his "Studien zur Literatur der Gegenwart" Stern presents quite an array of critical and biographical essays about nineteenth-century authors, both German and foreign; among the non-German we find such names as Turgenieff, Maupassant and Ibsen, Strindberg, V. Rydberg, and Snoilsky, with whom he was connected by close ties of friendship.

More than one class of students will be interested in P. M. C. Kermode's "Manx Crosses" (Bemrose & Sons, London), being a description of the inscribed and sculptured monuments of the Isle of Man from about the end of the fifth to the beginning of the thirteenth century. Among the earlier pieces, which number seventy in all, there are four with inscriptions in Ogam of the Munster type, three with inscriptions in Latin in debased Roman capitals or Hiberno-Saxon minuscules, and one with Anglian runes. Of the later Scandinavian pieces, twenty-seven are inscribed with Scandinavian runes, and nearly all are adorned with designs developed from Celtic models. The work as a whole is divided into four sections: (1) An introduction on the distribution of the stones, with plans and views of the ancient Keeils, or chapels, where some of the earlier ones have been found; (2) an account of the art of the monuments, with a summary of the patterns and designs, figures, etc., of the Celtic and Scandinavian slabs; (3) the inscriptions, figured on a uniform scale, with translations, alphabets, etc.; (4)—and most important—full and detailed descriptions of the several stones, with figures bringing out the details of the more elaborate decoration. The present issue is limited to four hundred copies. The price (two guineas each to subscribers) will be raised after publication.

A new edition of "Nathan der Weise," by Dr. Tobias J. C. Diekhoff of the University of Michigan (American Book Company), directs attention again to an unusually well prepared *Ausgabe* of this classic. Besides a bibliographical preface, there is an introduction of sixty-six pages dealing with "Nathan as a Religious Polemic," "Nathan as a Work of Art," "The Genesis of Nathan," and the "Historical Foundation" of the story. Dr. Diekhoff takes issue with those critics who have long followed "the fashion to speak of 'Nathan' as the great plea for religious toleration," asserting that "it was not toleration about which Lessing was primarily concerned," but that he wrote against the orthodox Christianity of his time.

News reaches us of the death of Sir Spencer Walpole, known in letters chiefly for his "History of England in the Nineteenth Century."

MANAGING IRELAND.

The Irish Parliament: 1775. From an Official and Contemporary Manuscript. Edited by William Hunt. New York: Longmans, Green & Co.

Including books already published and books in preparation there will soon be quite a library concerning British Parliamentary bosses. Charles Elphinstone Adams's "View of the Political State of Scotland," published in 1887, was the first in the series. Next came McCullagh Torrens's "History of Cabinets," a book of not much value, but at least of service for the extent to which Torrens drew on the enormous mass of electioneering letters and papers that were left by Henry Pelham Clinton, Duke of Newcastle, who was the most active Parliamentary boss and borough-master of the Georgian era. It has long been known that a life of Henry Dundas, the greatest Parliamentary manager of Scotland between the Union and the Reform act of 1832, is in preparation; and more recently there has been an announcement that at the long last an author has been forthcoming—a Canadian, by the way—who is not appalled by the work which must confront the biographer of George III., the greatest Parliamentary manager among the Kings of England from the days of the Stuarts to the Victorian era.

While students of the working of the Parliamentary system are impatiently awaiting these biographies of Dundas and George III., Dr. Hunt has come forward with another and quite unexpected contribution to the growing library of Parliamentary management, and has edited a report on the Irish Parliament which was prepared in 1775. Lord Harcourt was Viceroy at that time, with Col. John Blaquiere as his Chief Secretary; and it was one of the imperative duties of Harcourt and Blaquiere to see that the Government never failed to control a sufficient number of the members of the House of Commons to allow of its business going through Parliament with as little delay and obstruction as possible.

It had not always been the business of the Lord Lieutenants and Chief Secretaries to undertake this disagreeable work. Prior to 1767 the English Government had let the business out on contract to Irish magnates—lay and clerical—who are known to-day in Irish Parliamentary history as undertakers. But George III. was addicted to Parliamentary management; and, not having enough of the business on hand at Westminster, he had in 1767 taken it out of the hands of the native territorial bosses—of these long recognized professionals—and committed it to the Lord Lieutenants. These new duties were never congenial to Englishmen charged with the government of Ireland; and there was not a Lord Lieutenant from the days of Townsend, who was in Dublin when the change of 1767 was made, to those of Cornwallis, who had the business in hand at the Union, that did not deplore the necessity of dealing with the Irish gentry who came to market at Dublin Castle with the House of Commons votes they had for sale. In the Irish archives for the period between 1767 and the Union, there must be many reports not unlike that which accidentally found its way into a London second-hand bookdealer's stock, and ultimately came into the possession of Dr. Hunt. This report was compiled by Blaquiere when he and Harcourt were facing a crisis in the House of Commons over a money bill—a crisis that was rendered the more acute by the pending trouble in the American Colonies. But crises in the Irish House of Commons were of frequent occurrence all through the last half of the eighteenth century. They were inevitable; for it was obviously to the advantage and profit of the grafters who hived in the Lower House, and also of the peers who were borough-masters, to create a crisis, and to make the Lord Lieutenant and his secretary realize that danger was ahead for any Government measures that were pending. A crisis meant an upward movement in the quotations at Dublin Castle for votes in the House of Commons, and a hastening to market of almost every man who directly or indirectly controlled any Parliamentary influence.

As the Blaquiere manuscript shows, it was with varied currency that the Chief Secretary went into the market. For borough-masters who controlled many votes there were peerages and promotions in the peerage, Irish Privy Councillorships, church patronage, and small Government jobs to be handed on to their heelers in the constituencies. For members in the House of Commons who owed allegiance to no borough-master—men who had bought borough seats outright—there were in some cases Irish peerages; but most of these men were paid in offices or pensions, or in money bonuses; while for the less fortunate men—the impecunious lawyers who owed their seats to borough-masters who had first claim to the Government rewards—there were offices of less value, and now and again a pension or a gift of money. With only two or three exceptions—notably Macartney, Blaquiere, and Castlereagh—every secretary to the Lord Lieutenant from 1767 to the Union was an Englishman. During this period it was not deemed expedient in Downing Street to trust an Irishman with the delicate duties which House of Commons management threw on the Chief

Secretary; and the first question that a new Chief Secretary asked on taking possession of his desk at Dublin Castle was, "What have I to go to market with?" which meant how much money was there at his disposal for bribery; how many pensions could be distributed among the dependent and needy Parliamentarians; and how many peerages or promotions in the peerage George III. would sanction to buy the House of Commons support of the rapacious Irish territorial magnates—the men who had accumulated riches and honors out of their close connection with the wretched hybrid institution which was known until 1800 as the Irish Parliament.

Two vignettes from Blaquiere's gallery of portraits of these Irish statesmen will serve to indicate the commerce that went on in the Chief Secretary's room in Dublin Castle. They are those of Maurice and Robert Fitzgerald. Maurice was boss of the Borough of Dingle. All Irish boroughs were represented by two members. One of the seats for Dingle, Maurice Fitzgerald bestowed on himself. The other was kept in the family and went to Robert Fitzgerald, cousin of Maurice. But although Maurice was the borough-master, it is plain from Blaquiere's sketch of the Fitzgeralds that it was Robert who got nearest at the shaking of the plum tree.

Fitzgerald, Maurice. B. DINGLE ICOUCH. Made a Surveyor General by Lord Townshend—reduced upon reuniting the Boards—received a Pension, in lieu of £300—has two seats in Parliament—weak, entirely under the Government of his wife—Lord Harcourt has given to his Recommendation one tidewaiter.

Fitzgerald, Robert. B. DINGLE ICOUCH. Brought into Parliament by his Cousin Maurice—Judge of the Admiralty, £400—Commissioner of Appeals, £300—Comptroller of Dingle with an additional salary of £400—Lord Townshend gave him a living of £500 for one Nephew—£200 to another—Ensigncy to a third—and he recommended an additional Sallary to him as Commissioner of Appeals for £300—Lord Harcourt has given him a hearth money Collection for One Friend and accommodated him with a Move for another—gave him a Seat at the Linen Board—He speaks very seldom in the House, when he does but very moderately—his chief Merit is that he attends when he is desired—He now wants additional Emolument either by additional Salary to the Offices he now holds or by new creation, whether by Place or Pension it mattereth not—Lord Harcourt has given to his Recommendation 3 tidewaiters—2 Gaugers and One Hearth Money Collection.

All Blaquiere's sketches of the Irish Parliamentarians are in this matter-of-fact style. He was merely making a catalogue for submission to Harcourt of the men who could be bought, and of those who were out of the market. Most of them were in the market; and the chief purpose of the schedule was to enable Harcourt and his Chief Secretary to foot up the cost of the contest in the House of Commons which was confronting them, and to ascertain whether they had at command a sufficient number of offices—military, civil, and clerical—and a large enough stock of available money, to admit of their going into the contest with a full hope of success. Dr. Hunt gives an adequate sketch of the Irish Parliament in the eighteenth century as an introduction to the Blaquiere manuscript; but had the manuscript been put forward quite alone it would have told its own sordid story, and more graphically than any monograph on the Irish Parliament that now exists it would have exemplified the character of the institution that disappeared at the Union of 1800.

CURRENT FICTION.

The Wingless Victory. By M. P. Willcocks. New York: John Lane Co.

It is no reproach to Miss Willcocks's powerful uovel to say that in atmosphere, in some of its characters, and in a good deal of its details it is strongly reminiscent of Thomas Hardy's "Jude." The locale of the two stories is almost the same, though there is more of the sea in South Devon than in Hardy's Wessex, and much less of the moorland. But moorland there is in this story, too. and the dun light in which Hardy's people move, and the brooding law, emanating from plain and granite rock, that rules their destinies. There is no desire to carry the comparison too far; the present novel is not the merciless study of necessity that "Jude" is; it is not so honest a book, partly on account of its less capable artistry and a greater adherence to the restrictions which Anglo-Saxon standards impose on the imagination. On the other hand, in putting "The Wingless Victory" by the side of "Jude the Obscure," if only for a moment, it is our intention to suggest something of the merit of a story that rises high above the level of common day fiction. We add that it is a book which invites a second reading with a still further examination of, and lingering over, certain choice passages.

The theme is old enough—the interplay of law with nature insufficiently tamed, or crushed, as we choose to look upon it. The woman who wants to live out her life is generally and unfortunately an unpleasant personage in fiction. Possibly it is because of her creator's usual tendency to make her an agitator instead of a rebel, to lay greater stress on her shattering of conventions than on her realization of self. Wilmot Borlace, in the present book, clearly escapes the fate of being portrayed as an anarchist, when she is only a passionate woman, half artist, half peasant. For her, and to a somewhat less degree for her husband, it may be said that they ring true, however artificial may be the device of bringing her high emotionalism into contact and contrast with a temperament compounded of materialistic skepticism and immense practical kindliness.

In detail there may be much to cavil at. The emotional pitch, for instance, is struck too high at the very beginning, and, kept at its high range throughout the volume, tends to become exhausting. Too much rhetoric and too much scene painting, on the whole, mar the method of a book which can show page after page of splendid writing. The sea, the cliffs, and the moorlands intrude to excess upon the human actors. On this point we may turn to Hardy's "Jude" or Gustav Frenssen's "Jörn Uhl" for instances of how that desirable quality called atmosphere may be attained without too obvious labor. Their Wessex or Frisian moorland encompasses its native-born with subtle, though omnipotent, forces. In Miss Willcocks's elaborate descriptions we discern a certain scraping of stage scenery being shifted. In the same way there is unnecessary harping on such indefinable elements as "race-processes" and "electric forces of the ages," unnecessary reductions of action and feeling to terms of biology and prehistoric anthropology. When man meets woman, passion is engendered. This was known even to the Pre-Darwinians.

The Old Country, A Romance. By Henry Newbolt. New York: E. P. Dutton & Co.

This is a serious piece of writing, and a serious piece of reading. Its note is literally the high fantastic. After the average story, with chapters as emptv as noisy, it soothes, its very heaviness giving an unwarranted satisfaction of exercise to muscles not often called upon in reading fiction. True, it opens as a chilly love-story hovering between sociology and politics. But it soon appears that this is but the prologue, too much prolonged perhaps. While we patiently and forebodingly await the usual conversions and developments, the steeds are brought to the door, and lo! with the hero, casting commonplace behind, we ride into the fourteenth century. Backwards or forwards, that is the question. The answer—that the centuries before us and behind us are sisters, daughters of Time and heirs to treasure, share and share alike. There is almost no antiquarian revival of costuming or of manners and customs. It is in a spiritual sense that the past is revisited and wedded to the future. The scruples of souls, the hunger of humanity for life everlasting, the imperishable love of kindred, above all the obliteration of time where human relations are involved, are the themes gathered into unity in the eyes of the beholder, the young sociologist of our own day. It is true that there is historic clothing of universal truths. We see the dawnings of Protestantism in England. We sit by the wood fire with heroes returned from Poitiers, and hear true recitals of their adventures. But after all it is less the history of the Church than the ebb and flow of toleration that engages the reader's mind. Less the fighting at Poitiers than the very human traits, the modern nobilities and inconsistencies of the princes and soldiers who fought.

It is essentially a romance of England, and could have been inspired by no less tender a patriotism than that which drew from Henley "England, My England," or from Kipling "Puck of Pook's Hill." The end far more than atones for the stiffness of the beginning.

Disinherited. By Stella M. Düring. Philadelphia. J. B. Lippincott Co.

The author who keeps even one eye on the probabilities has a hard task. Miss Düring, in following her fancy through the phases of the remarkable career of Avice Carlyon, must have felt a reckless exhilaration akin to that of the young woman who didn't care! All the birds of the air were welcome to sit on her bonnet. It is a story of the unrelieved guile of a woman pitted against the immovable integrity of a man. His title and estates are threatened, and his own true love's mother will not let her daughter marry him. Many are the means used by novelists to keep young Englishmen out of their lawful inheritance. Miss Düring's way, though founded in commonplace, reaches finally a dizzy height of sheer fancifulness. The ultra crudities of

the opening, where Avice makes her entrance into society, so little prepare the reader for any display of ingenuity that the later absurdities prove a rather welcome relief. A tangle grows which seems impenetrable, but aided by the friendly and frequent services of the undertaker, the chivalrous hero comes to his own. We cannot mourn the departing friends, for this is a case where all that ends ends well.

SOME BOOKS ON JAPAN.

Kakemono; Japanese Sketches. By A. Herbage Edwards. Chicago: A. C. McClurg & Co.

Japan. By David Murray. Supplementary Chapters by Baron Kentaro Kanego. New York: G. P. Putnam's Sons.

Makers of Japan. By J. Morris. McClurg.

Dictionnaire d'histoire et de géographie du Japon. By E. Papinot. Yokohama: Kelly & Walsh.

Japan in Days of Yore. By Walter Dening. Tokio: Methodist Publishing House.

Japan as It Was and Is. By Richard Hildreth & Ernest W. Clement. McClurg.

Le Japon; histoire et civilisation. By Mis de la Mazelière. Paris: Librairie Plon.

The first in our list is a series of slight sketches, more ambitious than successful, and scarcely deserving the name "Kakemono," which seems to indicate artistic touch and insight.

The second is a new edition of a well-known book with additional chapters by Baron Kaneko, and these, like most writings of Japanese for a foreign constituency, add little to our information.

"Makers of Japan" is a journalistic account of prominent statesmen, convenient for newspaper reference, and for all those who do not seek more than the current notions about distinguished men.

Papinot's "Dictionnaire" is a reference book which covers a wide territory, and shows signs of great industry, though it retains much "information," which is the commonplace of men who have not kept themselves abreast of the results of scientific inquiry.

Mr. Dening's book is a collection of tales from old Japan, not as representative as Mitford's nor translated in such charming fashion, but still containing enlightening specimens of the ancient days. The stories represent much the same state of society as our tales of feudalism, with something less of tenderness and high ideals and devotion to women.

The two remaining volumes are of different character. They represent respectively the best European knowledge of Japan in 1855 and in 1906. Both use the highest authorities and are trustworthy throughout. The author of the first, Richard Hildreth, thus describes his method: "My interest . . . in this secluded country has produced this book, into which I have put the cream, skimmed, or, as I might say, the juices laboriously expressed from a good many volumes, the greater part not very accessible nor very inviting to the general reader." He lets "the reader see Japan with the successive eyes of those who have visited it, and he concludes "that with all that is said of the seclusion of Japan, there are few countries of the East which we have the means of knowing better or so well." The book bears out this statement, for, after fifty years of intercourse, the impression is of the accuracy and breadth of the information conveyed. Had our diplomatists and merchants and missionaries studied Hildreth many costly errors would have been avoided.

He begins, it is true, with Marco Polo, who merely relates what he had been told—a traveller's tale, with its story of the Emperor's palace, its roof plated with gold "in the same manner as we cover houses, or more properly churches, with lead"! But Hildreth puts this in merely as a curiosity, and goes at once to the Portuguese accounts from the sixteenth century. His great authority, however, is Kaempfer, and a better or more trustworthy one could not have been found. Kaempfer was a German physician, who, after serving in Persia as secretary of an embassy sent by the King of Prussia, obtained the place of chief surgeon to the Dutch East India fleet, since he had formed "a firm resolution to spend some years longer in seeing other Eastern courts, countries, and nations." After a time he obtained the position of physician to the Dutch Factory in Japan and reached Nagasaki in 1690. His opportunities for study seemed limited, indeed, but his medical skill, scientific attainments, consummate tact, and bribes opened all doors to him. Twice he made the long journey overland to Yeddo, visiting the Court of the Shogun, his trained eyes, ears, and mind perceiving things as they were. His judgment of the people may still be quoted with approval: "Naturally the Japanese were, their pride of warlike humor being set aside, as civil, as polite, and curious a nation as any in the world; naturally inclined to commerce and familiarity with foreigners, and desirous to excess to be informed of their histories, arts, and sciences."

Besides Kaempfer, there are the accounts, much abbreviated, of Thurberg, Titsing, Golowin, and others, who add comparatively little to Kaempfer's story. From them Hildreth arrived at a clear judgment as to many matters long after still debated. Sir Harry Parkes, for example, was credited with discovering that the Shogun was not an Emperor, but Hildreth already uses Cromwell's term "lord-general" in describing him. He knew also the trustworthiness of the Japanese chronicles, though they are still used as authoritative in the French Dictionary of Japan, named in our list. He also distinguished the Japanese as a race from the Chinese, and knew the complete unlikeness of their languages. The editors of this new edition have changed Hildreth's spelling and added notes, the chief wonder being that they have found so little to correct.

The last work upon our list is the most important. The Marquis de la Mazelière is a student of Oriental civilization who has already published volumes upon the civilization and the religions of India, with a small book upon the history of China and still another upon the history of Japan. This work on the History and Civilization of Japan is to be in five volumes—the first three cover ancient Japan, feudal Japan, and the Japan of the Tokomura régime; the remaining two volumes are to discuss modern Japan. He begins with a long interpretation discussing the civilization of Asia and its relations to what we know in Europe. For him the two continents are one and he traces the institutions of both back to Babylonia and Egypt, for from these two centres the civilization of the world has come. Turning to Japan, he reviews its physical features, the races which have formed its peoples and the general characteristics; then in more detail he discusses the development. In each division he describes the history and the religion with the art and literature and philosophy and social characteristics of the people. It is by no means a bare description, but the result of prolonged studies in comparative ethnology, taking this term in its widest sense. He brings to bear illuminating comparisons and seizes upon the all-important points in his authorities. He has laid all modern scholarship under contribution with due acknowledgment. Differ as we may from many of his conclusions and from even his principal thesis, we none the less recognize the high value of his work and shall look with interest for the remaining two volumes. To return to the comparison with "Japan as It Was and Is." The older work is a report by faithful observers of things as they saw them; the other is an attempt to penetrate the surface and, by the aid of comparative studies, to understand the philosophy of history. We need not add that only by the method of the Marquis de la Mazelière can we hope to know any people as they really are.

Dante and his Italy. By Lonsdale Ragg. New York: G. P. Putnam's Sons. $3.50 net.

Mr. Ragg's book consists of a series of essays linked together in a chain of very unequal quality and strength. The earlier chapters would concern almost any Italian of those days; the environment is there, but the great figure does not stand forth as soon as it should in a book which is not a history of Italy in Dante's time, but aims to show the conditions that shaped his character and destiny, and to keep before our mind's eye a vivid, ever changing background of living scenes wherein the presence of the man himself shall be always felt. This is precisely the historical illusion created by Gaston Paris in his life of Villon: he describes nothing that is not to the point, and the absolute relevance of every detail does not distort the environment for the sake of the single figure in whom our interest is to be concentrated. In his subsequent chapters Mr. Ragg keeps Dante more in the foreground, and these are the chapters that entitle their writer to most esteem as an artistic biographer.

Mr. Ragg has not undertaken to tell the whole story of Dante's life so far as it can be known, but only certain great moments, or particular phases that have seemed to him to need fresh investigation; his work, therefore, does not rehearse what can be easily read in Kraus, Toynbee, Gardner, and many other biographers. With a little more system, a greater tenacity in developing each of his themes, Mr. Ragg would have written a book to be often opened for reference after being once read for pleasure. For almost every page he has gone to original sources, to Salimbene, Villani, and other good recorders of the

time; he has visited most of the scenes where Dante is believed to have wandered, and he has read Dante himself, not at random, nor *per diletto* simply, but as Dante deserves to be read. He has availed himself of many works on Dante by modern scholars (among them, two Americans), and gives them credit in his notes or in his bibliography. But it is curious that he should have found nothing to his purpose in the forty-seven volumes of the *Giornale Storico*. That he cites Panthier's antiquated edition of Marco Polo instead of the classic edition by Col. Yule is to be explained, perhaps, by the fact that Italian libraries contain very few English books, even though they happen to be indispensable editions of Italian masterpieces. (Mr. Ragg obviously composed most of his volume in Italy). But why did Mr. Ragg admit among his thirty-two illustrations, mainly so valuable, that head of Frederic of Swabia "From an old print of 1600" (*sic*)? If any authentic portrait of the Emperor exists, it would belong to an epoch in which the art of making accurate likenesses was not even born, as every one must know who has studied the miniatures, sculpture, and coins of the early thirteenth century. It is a pity, too, that this book should be marred by many misprints in foreign words.

A more serious defect is an excessive fondness for the dramatic and picturesque, which leads Mr. Ragg into baseless conjectures and striking inconsistencies. On very little or no documentary evidence he makes Dante one of the Florentine ambassadors to Rome in the year of the Jubilee. "Dante was there," says Mr. Ragg, and he skilfully draws an imagined scene which he converts into authentic history with a fallacious question: "Was it not then that he acquired that fine scorn for the venal and simoniacal Curia . . . 'where all day long they make merchandise of Christ'?" Perhaps. But, having turned completely from historian to novelist, Mr. Ragg describes Dante as "pacing the corridors of the papal court like a lion in the cage." A humble footnote on page 39 upsets everything by declaring that Dante's presence there is "purely a matter of inference." In the same way, in his chapter on Frederic II., he repeats as though they were genuine history various typical legends due to the creative hatred inspired by the Emperor, and immortalized by the truthful but not always critical Salimbene. Such, for instance, is the story of his having isolated babes in the care of mute nurses in order to determine what language they would spontaneously speak. Possibly this and other like tales are characteristic, even "representative," but they should be taken with the grain of salt which flavors many a statement in Salimbene.

Again, in his chapter encroachingly entitled "Dante's Century," facts of every hue follow one another with little regard to their kinship or bearing upon any definite theme. The result is speedy oblivion for them all.

Despite these and other flaws, Mr. Ragg has written an interesting and enlightening book. The pages devoted to "The Gentler Side of Life" are charming in style and full of well-arrayed and entertaining facts. Here, as in other chapters, much that is not new is made fresh by being happily expressed. The position of woman in life and in literature, music, sports, festivities, and Dante's sense of humor are among the topics most pleasingly treated. Mr. Ragg is one of the few who have convinced themselves that there are humorous passages in Dante's works, but he hardly strengthens his thesis by quoting apocryphal, or merely traditional, anecdotes. Another excellent chapter is that in which Mr. Ragg has essayed the arduous but not impossible task of rebuilding Dante's Florence. Many landmarks, often associated with the poet, must be swept away; among them the Campanile, designed by Dante's friend Giotto, and with it the Cathedral. "Il mio bel San Giovanni" must be stripped of its zebra-like veneer of marble; furthermore, as D'Ovidio has shown so clearly in his latest volume of essays, the baptismal fount within it now is not at all like the one that Dante broke to rescue a suffocating child; we shall lose the bronze doors of Andrea Pisano and Lorenzo Ghiberti; scores of famous buildings now visible must vanish; others, known to Dante, must reappear. To a certain degree this chapter repeats what Witte (whom Mr. Ragg seems not to have read) long ago made clear in his essay on "The Topography of Florence about the year 1300," yet Mr. Ragg has not broken in an open door, and these pages are as graceful and authoritative as any in his book. Even better is the chapter on "Dante's Hosts." Here Mr. Ragg is dealing with a theme dear to his heart; no one has ever traced the exile's wanderings with greater competence and sympathy.

The British City: the Beginnings of Democracy. By Frederick C. Howe. New York: Charles Scribner's Sons. $1.50 net.

This book is properly to be read in connection with Mr. Howe's earlier volume, "The City, the Hope of Democracy." That work, in fact, explains the point of view from which the author approaches his study of the British city as it is and as it may become. The point of view is that of a believer in the city, its destiny in the society of the future, and the tremendous importance of making the city "livable" for the poor as well as the rich. In a general way Mr. Howe is the expounder of the philosophy which Tom L. Johnson of Cleveland—to whom this book is dedicated—has done much to work out in a practical way.

Franchise grants, in his view, are at the root of all municipal evil, and the fact that in England public utilities are either operated by the cities themselves, or if placed in private hands at all, so disposed by act of Parliament, he considers the primary reason for the absence of corruption in local affairs. Although England and Scotland furnish the stock examples of successful municipal trading, Mr. Howe's own view goes even beyond that of the British public. "To the man in the street," he says, "the case for municipal ownership has been made. It is no longer a question of propriety. It is one of expediency. . . ." To the author, however, municipal ownership is a great moral, not a financial, issue. "The stakes involved are political freedom." He has little faith in the regulative politics to which the American States, notably New York and Wisconsin, seem to be committing themselves at present. "Regulation," he remarks of the British tramway franchise, "failed, as it must inevitably fail." Mr. Howe's investigation, made as an expert for the Department of Commerce and Labor, should have given him exceptional opportunity to master his facts. As set forth here, they read rather like a brief on the municipal ownership side.

It must be the general criticism that Mr. Howe's message seems entirely too good to be true. Granting all that he says of the pervasive evil which grows out of franchise grants, there remain other forms of graft in contract and office jobbing which Americans will find it hard to believe any change of civic functions could eradicate permanently. Even the upper-class tradition in politics, for which Mr. Howe has such scant respect, is usually considered at least a contributing cause to the honest and efficient administration of British public activities. There was political corruption long before there were gas or street-railway franchises, even before, as Kipling says, "they hewed the Sphinx's visage." And did not the very James Dalrymple whom Mr. Howe mentions in connection with the Glasgow trams make for Mayor Dunne of Chicago a highly pessimistic report on the possibility of repeating in the American city the successful experiment of his own municipality?

Mr. Howe never lets himself forget that he is writing for American readers, and the contrast which he draws between municipal conditions in the two countries is really the book's most valuable and illuminating feature. As the choice of sub-title, "The Beginnings of Democracy," would indicate, he regards the example of the British cities as an inspiration to our own. He finds in them a spirit that must look for parallels to the days of the Italian city republics:

> A city that keeps its hands off, that does nothing but police and clean the streets, means but little to the people. But when it adds to the traditional functions, the manifold services of transit, gas, water, electric light, libraries, parks, baths, and lectures, it awakens the love and interest of the community in itself. In the trading towns people talk city. One hears it in the clubs, the restaurants, on the street cars, everywhere. The fact that a man is a joint owner in the tram line makes him critical and appreciative of the tram. He is interested in its earnings—he follows its balance-sheets from year to year. He talks about extensions, rates of fare, and the innovations suggested by the council. He follows the doings in the town hall, and knows in an intimate way the life and traditions of his councilman. The debates of the council are far more absorbing to him than the doings of Parliament. All these things are but the reflex action of the city upon its people. It becomes the most important thing in their lives.

After so favorable a criticism it is a little surprising to read such an assertion as that "Modern Britain differs but little from France of the old régime." This is not too strong language, in Mr. Howe's view, to characterize the system of taxing rentals. The British Town Council is a rate-payer's body, and the rate-payer is not the owner, but the user of the land. To a disciple of Tom Johnson there could hardly be a more crying wrong than this, but Mr. Howe's analysis of the practical effect of these conditions is temperate in tone. While the rate-payer's steady and close in-

terest in city finances has made for honesty, the economy it has engendered has been often, he thinks, of the cheese-paring, penny-wise-and-pound-foolish kind. Schemes of comprehensive improvement are retarded, and really far-sighted officials defeated because their plans involved immediate outlay of money. Our less direct but more equitable modes of taxation, though commonly held responsible for much laxness in administration, will in the long run, Mr. Howe thinks, make possible a more intelligent development of our cities.

It remains to speak of one very serious fault—a most exasperating amount of repetition. With all his skill in digesting material, Mr. Howe seems unable to allude to a point previously made, without going back over the ground again. Points like the collapse of the tradition that politics is a profession of the "gentleman" and the universal interest and conversation on city affairs are positively rubbed in. And we might instance other unnecessary repetitions, like the description of the Lord Provost's office, the account of the City of London, and the story of Sir Samuel Chisholm's defeat for Lord Provost of Glasgow, told once on page 45 and again in detail on page 166.

This book must be considered, as we have said, as the work of an avowed enthusiast. The majority of American readers, we believe, will refuse to follow Mr. Howe to all his conclusions. But as an able and suggestive argument on one side of a debatable question, there are few persons interested in municipal questions who will not find it of value.

The Shameless Diary of an Explorer. By Robert Dunn. New York: The Outing Co. $1.50.

Wearied with the restraints of a conventional civilization two little Ohio schoolboys once agreed to go out behind the barn together and say the very wickedest word they could think of, right out loud. The net result of their revolt against an oppressive morality was an emphatic *Darn!* As a protest against conventional restraint, Mr. Dunn's "shameless" diary is of somewhat the same sort. It is professedly a daily record of the unsuccessful attempt to reach the summit of Mount McKinley, made during the summer of 1903 by a party of explorers better equipped in ambition than in certain other qualities desirable for such an undertaking. The writer is filled with the idea that explorers of to-day habitually do not attempt an honest record of their experiences. To him, on the contrary, "it is unfair to nature and the blessed weaknesses which make us human to divert by one hair's breadth in any record of the trail from facts as you saw them, emotions as you felt them at their time." If the explorer is bound to be exact about his *diptera* his *schists* and his *conifers* must he not "record as truthfully and in full how the outer waste and the ego of each companion uplifted or scarred his own?" In other words, as applied to this particular case, are not the bickerings and trivialities of five ill-assorted and (to judge by this diary) commonplace persons worth as carefully detailed statement as the objective facts of nature developed by their expedition?

Many a reader may answer the question in the affirmative and still doubt the justification of the publication of this volume, for its contributions to science are certainly neither voluminous nor notably exact. One finds but little in the body of the book, however, to fulfil the expressed and intimated prefatorial promise of a shocking "seamy side" which all other writers would have felt obliged carefully to conceal. True, some writers would have had less to say about mending drawers, and the frequent washing of dirty socks, and the apparently less frequent ablution of bodies, but are these the things which are "to realize something of that large perspective" in the revealing of life as he saw it "in the back of beyond"? So far as substance is concerned, the one really shameless thing in this diary is the account of the constant brutality toward the horses of the expedition, culminating in abandoning them to starve to the point where the wolves would pull them down and tear them to pieces instead of ending their sufferings mercifully by shooting them, when it became impossible to take them further. If Mr. Dunn's account comes anywhere near the truth, which he so loudly professes, none of the party apparently possessed even a modicum of "horse-sense" in dealing with horses, and within the pale of civilization they would each and all have been subject to heavy fine and imprisonment.

The party to which Mr. Dunn belonged scaled but a little over ten thousand feet of the twenty thousand which their goal required. *Mutatis mutandis* this is proportionally perhaps a fair measure of Mr. Dunn's success as a diarist of the expedition. As with many a predecessor, the result of his self-conscious determination to avoid the posing of which he imagines all others guilty has been his perhaps unconscious transformation into the worst sort of *poseur* himself. Genuine sincerity, frankness, and originality are not usually self-heralded. None the less, the volume contains here and there a bit of effective description, proving that the author really had the power to see beyond the dirty socks and mildewed blankets on the drying line, when he sat down to write up the day's events. He should have done so oftener and let us take the unpleasant details for granted part of the time.

The Problem of Faith and Freedom in the Last Two Centuries. By John Oman. New York: A. C. Armstrong & Son. $2.75.

Luther began his most significant writing, "On the Freedom of a Christian Man," with the paradox:

> A Christian is a free lord of all things, and subject to no one.
> A Christian is a ministering servant of all things, and subject to every one.

For two centuries the minds of religious leaders have labored at this antithesis, exalting first one side of the proposition and then the other, and it may be doubted if in the general consciousness the problem of authority, or of the relation of faith and freedom, is yet made clear. It is the long process of the working out of this antithesis by the leaders of Protestant Christianity that Professor Oman traces in his Kerr Lectures, with the design of showing that faith and freedom are not mutually exclusive, but rather that true faith is impossible without freedom, and that genuine freedom is the surest guarantee of real faith.

It will be seen at once that the lecturer has fixed upon a subject of great interest and importance, both to the speculative thinker and to the common man. The difficulty of maintaining devout and restful faith in the face of the largest liberty has perplexed the masters of thought and of governments no less than it has troubled humble and pious spirits, and the task of asserting the right of the individual to a soul in the face of the widest extension of law and mechanical force has daunted many, leading some to the panic of a return to absolute external authority, and inclining others to total resignation of spiritual belief. From one point of view or another master minds of the past two centuries have occupied themselves with these problems, and the determination of Professor Oman to pass the great debate under review showed insight of the first order.

His selection of material for study and discussion indicates no less discernment. From Pascal to Ritsohl those treatises are chosen for examination which exhibit most clearly the various possible attitudes toward the high question, and if the student learn nothing of freedom, he will at least find himself introduced to the really great religious treatises of the last two centuries.

As an analyst and critic Professor Oman exhibits marked ability. His faculty for arriving at the salient features of an essay, for penetrating to its spirit, for supplying in fair and generous appreciation what the author left to be understood, and further, for gathering the results of his observation into concise and picturesque phrase, distinguishes him as a keen student and a profitable writer. Whether the subject be Pascal or Butler, with whom he is in spiritual accord, or Hobbes or Newman, with whom he disagrees, the characterization is equally apt and forcible.

Judged by this essay, Professor Oman is a man of deep religious sense and feeling. One could scarcely describe Pascal with such sympathy who has not felt with that saint the smallness of man in the vastness of the universe, and the extraordinary contrast of our human nature, "touching the clod with one hand and the eternal laws of truth and righteousness with the other." It is this clear vision of the absolute distinctions of life as the ground of all religion which has done much to give this essay its value.

Unfortunately the lengthy historical review in these lectures somewhat dwarfs the direct discussion of the problem. The journey is so long, and the prospect by the way is often so interesting, that one is apt to forget whither he is travelling. To one who will keep the main theme resolutely in mind, however, and note the gradual but sure establishment of the new basis for faith, which appeared for an instant above the horizon in the days of Luther, but is only in our time rising to full view, the discussion will prove of no small suggestiveness. Suggestions of compromise, the spirit with the flesh and spiritual idealism with very material powers of the world, are heard often and in many quarters in these times, and it is like reason after panic to hear a plea for "a Church which has nothing left by which to impose her creed but truth, or her obedience but love,"

and to hear the assertion that our peril "does not lie in larger freedom, but in the mixture of incompatible methods of freedom and constraint."

Erinnerungen aus Amerika. Von A. Baumgartner. Zurich: Orell Fussli.

Professor Baumgartner visited the United States in 1905 for the purpose of lecturing at Chautauqua on Switzerland, its history, language, organization, and educational arrangements. He disclaims any right to speak of America as a whole, and confines his comment to what he himself saw and heard; the appearance, speech, houses, customs, and manner of life, as compared with those of Continental Europe. Besides Chautauqua, he visited the Swiss colony of New Glarus in Wisconsin, Niagara Falls, Boston, and some friends and relatives in the Middle States. With a large experience of educational institutions in Europe, he describes the summer school at Chautauqua as something quite unique in its organization, range of subjects for study, and in the class of persons who attended. At Chautauqua he met, talked with, and heard a speech from President Roosevelt, by the charm of whose manner to himself and the public he was capitvated.

Two chapters are given to a description and analysis of English and German as spoken in the United States. English he found but little changed from the mother tongue, and yet from new words, new uses of old words, retention of words almost obsolete in England, and slight differences of intonation, an educated American was always distinguishable from an Englishman. German is undergoing a gradual change, and giving way to English, except among a few groups who live apart, and do not read English, as, for example, the Swiss colony of New Glarus, where Swiss-German is still spoken by the original settlers. Many examples of "Pennsylvania Dutch" are given, *e. g.*, "Das bietet alles," that beats all; "Die billygoat ist über die Fenz gedshompt und hat den Käbbidsch gedamidscht."

There are chapters on the negro, the Indian, laborers, their houses, wages, and cost of living; on American schools, teachers, and pupils. America, says the author, is the paradise of servant girls, and he confirms his own observation by relating a conversation with a Swiss whom he had known as a servant in Switzerland, and who had been a servant in America, and was now a happily married woman ruling over her own household. Absence of intoxicating drinks at meals and the general sobriety of the people were a pleasing contrast with European habits. Coming from the most democratic country in the Old World, Professor Baumgartner found the general atmosphere in the United States still more democratic. Recognition of social equality breeds self-respect and respect for others. The professor is evidently an optimist; everything pleased him, and he apologizes for this, saying that as a guest of friendly hosts, and travelling for pleasure, he did not come in contact with poverty, misery, or the darker side of American life. The book contains forty-nine illustrations, among which are plans and elevations of typical villas, workmen's and farmers' houses.

The book would not have been unduly enlarged if the author had added, as an appendix, his lectures, given in English at Chautauqua, or such a selection as would have afforded his American readers some interesting information about the older sister republic in Europe.

Science.

The Control of a Scourge; or *How Cancer is Curable.* By Charles P. Childe. New York: E. P. Dutton & Co. $2.50 net.

This book, by an English surgeon, is written with the hope of arousing intelligent laymen to coöperate with medical men in restricting the damage done by a disease which is universally dreaded and, alas! as universally neglected. The problem is really a very serious social problem; for the disease is insidious, knows no social limitations, depends upon no environment, and takes its victims in just those maturer years when death is most regrettable and often means an irreparable loss to others. As many readers know, there is just now a very active and careful investigation of the nature and cause of cancer. Several large cancer research funds have been established, and both here and abroad many capable men are at work in numerous laboratories especially equipped for this purpose. As yet the results are meagre and uncertain, and much time may elapse before anything definite or helpful is attained. In the meantime the loss is appalling, regardless of the suffering and misery involved. In England the cancer death rate is about one in 1,200 of the population, and in a certain large American city there were recently thirteen such deaths in a total of 603 for one week, taken at random, and showing a very similar annual rate.

Mr. Childe seeks to present certain facts regarding cancer in such simple form that they may be widely understood at the top and then be made known yet more widely lower down by energetic individual teaching on the part of charity workers, district visitors, nurses, midwives, and others. He insists that some form of irritation, in certain cases clearly avoidable, is a direct or indirect cause, and that the initial process is in no sense a general disease of the body, but a strictly local process, spreading with a variable rapidity. As to the question of heredity he is skeptical, in very good company; and heredity even if convincingly demonstrated would in no wise weaken his argument. That argument is that an early excision of the still localized process is known to have cured so considerable a proportion of carefully studied cases that the conclusion is justified that early recognition of the trouble and its prompt removal at a time when it is still possible to do this thoroughly would result in such an increase of cures that the disease would become comparatively harmless. We may add that a very similar statement has recently been made by an eminent American surgeon of wide experience, who also notes that such early, timely operations have proved to be exceptionally safe.

As to most forms of cancer these views are shared by the best medical men, and deserve to be widely known. In this matter physicians might perhaps do more than they have done, but they can do only a small part of what needs to be done. In a large number of cases the premonitory symptoms are neglected, and the patient comes to the physician when it is already too late. The difficulties to be overcome are great. A curious dread of an operation (aggravated oftentimes by the perhaps unnecessary expense), the wide-spread fallacy that every cancer is necessarily fatal, and the optimistic confidence in the quackery of the various "sciences" and "isms" all combine to lessen the chances of the patient. Mr. Childe urges, and rightly, that none of the so-called "cures" (x-rays, violet leaves, the much lauded trypsin, and many more) are anything more than uncertain palliatives.

"Bird Notes Afield," by Charles Keeler (Paul Elder & Co.), is true to its sub-title, "Essays on the Birds of the Pacific Coast with a Field Check List." Eastern readers cannot fail to be filled with envy when they read of the wonderful diversity of country to be found in California—shore, temperate valleys, scorching deserts, and snow-capped mountains. No wonder Mr. Keeler's first sentence is, "We who know California think it the most glorious of lands." An interesting comparison of Western with Eastern birds is followed by a review of the various groups—from grebes to sparrows; after which come a dozen essays relating in more detail to certain places or seasons, with a pleasant running commentary on the bird-life. Perhaps the first and the last of these essays are of the greatest interest and literary charm—"Patrolling the Beach" and "In a Mission Patio." In the former we are taken along the San Francisco shore, while a storm still roars and thunders around us:

> Here and there amid the kelp, or sometimes along the open beach at the line of high tide, lie the bodies of birds which have been overcome by the elements. I fancy I can hear their wild cries in the night, almost lost in the tumult of the gale, as the great white ghosts of waves leap up and drag them under. Even the albatross has not been spared, for here he lies, his plumage wet and bedraggled, and his immense pinions half buried in the sand—the king of sea birds, the master of the air! See his huge, brown back, his breast of gray, mottled with brown, his feet of livid gray, and his large tube-nosed beak of a pinkish flesh-color, tipped with blue. A day ago his broad wings were swinging him down into the cold, quivering hollows, between the towering wave crests, and he was revelling in the tumult of the storm. To-day he is but a clod for the life-saving patrolman to kick as he passes along the beach.

The sixteen photographic illustrations are excellent, and taken all in all this is the best popular work which has appeared on the birds of the Pacific Coast region—interesting both to the Californian and to the bird-lover of other, less favored lands.

In "Forest Friends" (A. C. McClurg & Co.) John Madden recounts his own adventures as a boy in the forests and along the shores of Lake Michigan. His father was one of the early pioneers who pushed on to that region when it was still an almost unbroken wilderness, and the wild life—from pumas, bears, and deer to wrens and suckers—furnishes the theme of the book. The chapters are pleasantly written, and will appeal to the less fortunate boys of these later deforested times, who must look for their wildcats and bears in a museum. The writer keeps well within the bounds of

fact, except when, in his enthusiasm, he imagines deer leaping to a height of "ten or twelve feet" and "making broad jumps fifteen or twenty feet in length"! All the material, except the story of the birth and growth of the young fawn, seems to consist of actual reminiscences; and although no new facts are added to our store of knowledge, it is a relief to read a book treating of just ordinary creatures with ordinary habits.

Angelo Heilprin, geologist, geographer, and explorer, died in this city on July 17. Born at Sátoralja-Ujhely, Hungary, in 1853, he was brought to this country by his parents when he was three years old. His first literary work was to assist his father, Michael, in the revision of the "American Cyclopædia," but his strong bent for science determined his career. After completing his studies in this country he went to Europe and entered upon courses in biology and palæontology. In 1877 he was honored in London by the presentation of the Forbes medal. Later he sought Paris, Geneva, and Florence; and finally he spent much time in the Imperial Geological Institute of Vienna. In 1879 he returned to this country, and a year later was chosen professor of invertebrate palæontology at the Academy of Natural Sciences in Philadelphia. He soon became professor of geology also, and in 1883 he was appointed curator of the Academy. In 1892 he resigned his curatorship, but his time and energy were fully occupied with his duties as president of the Geographical Society of Philadelphia, as an active member of the national body, and as professor of geology in the Wagner Free Institute (1885-1890). In recent years he had also given courses at Yale. He was vice-president of the American Alpine Club, and in 1892 he led the Peary relief expedition to polar regions. When Martinique was destroyed, Professor Heilprin, together with scientists from all parts of the world, hurried to the scene. On May 29, 1902, having decided that the mountain had cooled sufficiently to permit investigations, he started from Fort de France. The next day he spent in studying the newly formed craters; and on May 31 he attempted the hazardous feat of climbing to the top of the crater. The volcano was active when he began his ascent, and several times he was thrown down by shocks or struck by bits of half-melted stone. Gaining the edge of the crater, he sat and took notes, while the huge pit bubbled and steamed. He remained two hours, in the course of which time there were three eruptions. One of them covered him from head to foot with hot mud. His published observations as to the frequency and character of the eruptions, the formation of new craters, and his statement that the mountain had suffered no diminution in height, were important contributions to knowledge of the subject. Among his writings are: "Contributions to the Tertiary Geology and Palæontology of the United States," 1884; "Town Geology"; "The Lesson of the Philadelphia Rocks," 1885; "Geographical and Geological Distribution of Animals," 1887; "Explorations on the West Coast of Florida and in the Okeechobee Wilderness," 1887; "The Geological Evidence of Evolution," 1887; "The Animal Life of Our Seashore," 1888; "The Bermuda Islands," 1889; "Principles of Geology," 1890; "The Arctic Problem and Narrative of the Peary Relief Expedition," 1893; "The Earth and Its Story," 1896; "Alaska and the Klondike," 1899; "Mont Pelée and the Tragedy of Martinique," 1903; "Tower of Pelée," 1905. Professor Heilprin was one of the most valued contributors to the *Nation*. He reviewed many books in his specialties, and he also wrote leading editorials, as well as short notes, on scientific subjects. His premature death deprives American science of one of its lights, and robs the large circle of his friends of a most attractive personality.

The death is announced of Charles Trépied, director of the Algiers Observatory.

Drama and Music.

Henrik Ibsen als Dichter und Denker. Von Anathon Aall. Halle a. S.: Max Niemeyer.

Dr. Aall approaches his task better equipped than many writers who have recently essayed an interpretation of Ibsen. To begin with, he is a Norwegian, and has long studied the northern giant. He is a docent in philosophy at the University of Halle, and should be trained in thinking out the abstract thoughts of peculiar poets. Moreover, he met Ibsen but a couple of years ago, and compared notes with the dramatist on his life and work. Most of the book was prepared in Norway in the winter of 1904, and a part has been added since Ibsen's death. There are metrical, as well as prose translations, by the author, and a bibliography of fifty-two titles, in which America is represented by the commentary of the lamented Boyesen. Throughout the chapters there is the impress of Dr. Aall's belief that "great men are to mankind not only teachers and educators, but in many ways a source of the greatest joy which life offers."

That which will attract the reader at once is the reference to Dr. Aall's visit to Ibsen. The earnest personality of the poet was apparent, and it was evident that he had mastered himself fully in the resolution to live his ideals. He was asked if he did not regard psychology as a means of dramatic representation rather than as an end, and he assented, declaring that his observation of the human soul served not only to develop that which is purely psychological, but consisted in throwing light on ethical problems. Dr. Aall believes that much of Ibsen's creations have passed over the heads of the average reader, and it was suggested to Ibsen that there may be in his works considerable that will be fully effective in the distant future when he shall be better understood. "At these words the old poet raised himself out of the chair to which his illness had bound him. It appeared as if he himself wished to begin to wander in the future, as if his tired tongue forgot its weakness; and he called out spiritedly: *Ja, wenn wir das nur glauben könnten!* (Yes, if we only could believe *that!*)"

Taking up the thread of Ibsen's life, Dr. Aall points out the effect of Norwegian environment on the dramatist's nature—the lofty, rugged landscape pushing his ideals to the extreme, while accentuating the spirit of loneliness and urging his heart more and more to communion with itself. Like Nietzsche, Ibsen was fond of the gloomy and horrible, as shown in the poetry of his youth, and he drew much dramatic material from the seamy side of Norwegian life. Not all that he wrote, however, is Norwegian in sentiment: "The Lady from the Sea" will not pass muster, nor will "The Banquet at Solhaug." Ibsen was an *Ostländer*, to use his own term, and as such did not know the sea or the typical Norwegian coast. "Brand" and "Peer Gynt" are genuinely national, and almost equally so are the characters of Loevborg, Allmers, Rosmer, Borkman, and Professor Rubek. Nora, too, partakes of the popular readiness of a fishing and hunting folk to expect the miraculous, but notwithstanding such characters as Hjördis, Mutter Aase, Hedwig, and Svanhild, Ibsen is generally less successful in portraying Norwegian women. Ellida is a product of phantasy, and Hedda Gabler is also an exotic. If one should wish to find her native country, he would be justified in directing his attention rather to certain aristocratic circles in England or America. It is not characteristic of the Norwegian woman, for example, to revolt against Nature and motherly duty, and she takes to the staff or the ski rather than to the revolver. She also does not have the bad habit of burning manuscripts—on the contrary, she prepares them herself! The new woman is known in Norway, but her ambition to shine in the world is tempered by her home-feeling, and perhaps that is why Dr. Aall finds it remarkable that Ibsen's women lead the dialogue:

> Every leading rôle falls to the women. The men come to know, through severe reproaches, how much wrong, especially toward the women, they have on their conscience. The men are repelled, humbled, and, above all, instructed.

The fact of the matter is that Ibsen is a dramatic theorist, and a passionate one at that, and has less interest in material things than in ideas and expressions of the will, to which facts give incentive. Ibsen's characters, therefore, are not merely un-Norwegian, they are not such as one will find anywhere in real life. There are no such amorous people, with ideas about love and marriage, as in "Love's Comedy," and no such farmer's youngster as Peer Gynt, who can philosophize in so many dialects. Nor is there any maiden like Lona Hessel who would journey back from America to the Old World simply to reclaim a lover of her youth. What is most remarkable with Ibsen's characters is that they do not love, they breathe simply their mutual idealistic affection. In Ibsen's development of the dialogue, his characters do not express themselves freely, they answer for him. In his own words, his poetry was the bride of his thought; but where was the bride of his feeling? There are passable scenes of love between father and son and between mother and son, and even between father and daughter; but nowhere in all of Ibsen's plays is there a single instance of love between mother and daughter! Ibsen is also awkward in bringing two women together in friendly relation—due, probably, to the circumstances of his own life and his separation from woman's influence—and since he did not believe in friendship (holding that one liking his fellowman should leave things undone rather

than be always doing, that friendly bonds operate against liberty, and that many professing friendships are false), he is usually unsuccessful in suggesting it. The one exception is the case of Sigurd and Gunnar in "The Northern Campaign." It is no mere accident that Björnson, Kiellaud, Lie, and Ibsen so often treat of social, social-ethical, and political questions, for Norwegiau geography, topography, and history have all contributed to these ends. When Ibsen went to Germany and Italy he experienced that tremendous change which comes over a man's life when the free atmosphere of a great civilized state works on his mind. There Schopenhauer and Hegel interested him, but it is doubtful if he made any special study of them, as is often asserted.

Ibsen's relation to his contemporaries is discussed, and Dr. Aall finds it difficult to fix the exact influence of Ibsen and Björnson on each other. Like a real German *Erforscher*, however, he maintains the likelihood that the work of the one stimulated the other, as in Björnson's "Between the Battles" (1858) on Ibsen's "Pretenders" (1863), and in Ibsen's "League of Youth" (1869) on Björnson's "Bankruptcy" (1875). Brandes stirred up Ibsen to nobler things and renewed effort, and Ibsen early found in Brandes all that the Dane afterward became, comparing his "Hovedströmninger" to the newly discovered California goldfields.

Looking more closely at Ibsen's work, and separating him as far as possible from external forces, Dr. Aall finds in Ibsen three native characteristics: a certain aversion or indifference to the purely physical side of human existence; an earnest disposition bordering on solemnity; and great strength of character, coupled with intellectual energy. His poetical works have the same compass as human life: in the beginning an energetic discharge of thought and will, and at the end sober thoughts on breaking off from human activity. Dividing his works into four groups—historical-romantic, national, problem plays, and *Frauendramen* in the narrow sense of the term—Dr. Aall doubts the accuracy of Ibsen's statement that they form an organic whole, and believes that the poet first fancied there was such a relation after he had written a number of dramas on more or less independent and separate lines. Ibsen's *Weltanschauung* depends on his knowledge of men, and among his characters Dr. Aall finds five types: the strong, the weak, the bad subordinates, the sympathetic spectator of life's drama, and the invalids, "people who in life suffer from a fundamental injury" (*Grundschaden*). Ibsen uses masks; but these have holes, and suddenly we perceive that we have looked into Ibsen's own face. Ibsen veered greatly from his attitude of half-reverence toward religion in youth, and eventually gave nothing positive—neither the laying bare of the real weaknesses of religious beliefs and their stumbling professors, nor a noble standard worthy of men's admiration and following. Sometimes he even fell into astonishing error, as when, in the warning of Maximos, he exclaims: "In your own name you must come, Julius! Did Jesus of Nazareth come as the envoy of another? Did he not say that he was the one who sent himself?" Finally, Dr. Aall discusses Ibsen's ethics, takes up the objections urged against him that he is a misanthrope, a disdainer of marriage, and an anarchist, and concludes:

Ibsen never placed his pen at the service of any kind of positive agitation. Society never had in him an advocate of a particular party platform. He belonged as a faithful adherent to neither the majority nor the minority of a movement. In his attacks, he avoided directing himself straight at the object. No particular institution, no particular conception of the labor problem, no theory of free love can consistently claim him as its own, and maintain: He is our man!

The promised appearance in a Broadway theatre next season, in an English play, of the favorite Yiddish actor, David Kessler, long an idol of the East Side, will be a dramatic event of more than common interest. For many years he has excited enthusiasm on the East Side by his impersonations in the plays of Jacob Gordin, Ibsen, Gorky, and Sudermann, among many others, and fervent tributes have been paid to his versatility, his wide emotional range, his tragic intensity, his humor, his pathos, and the veracity of his human types. Beyond question, he is an able and experienced actor, but it remains to be proved whether or not, in his long service in the Yiddish theatre, he has acquired faults—tricks of manner and expression—of which he will not find it easy to rid himself upon the English stage. Mannerisms of this sort were obvious defects in the early English performances of Madame Kalich.

Mme. Yvette Guilbert, who is in London, says that it is not her intention to abandon the variety stage altogether. She proposes to give half her time to comedy, half to the songs in which she has made her name. In October she will appear at the Paris Variétés, in what she calls a very merry comedy. Mr. Arthur Symons has written a piece for her, and Edward Knoblauch has made an adaptation of one of Lindau's plays.

Madame Hanakon, a Japanese actress, will be seen here, in conjunction with Arnold Daly, in the Berkeley Lyceum next winter. This lady is said to have made something of a sensation by her performances in Paris.

James K. Hackett has secured the American rights of Maeterlinck's "Blue Bird," but the expenses of production are said to be so heavy that it is by no means certain that the piece will be seen here after all.

It is reported that Olga Nethersole will produce, next season, a dramatic version of the opera "Ariane," the words of which were written by Catulle Mendès.

Paderewski has long been the most expensive of pianists, but he has once more raised his prices. At his last London concert every ticket cost a guinea. Every seat was taken, and the net profit for the two hours of playing was $5,000. That is twice as much as Caruso gets for singing in a four-hour opera. It is pleasant to note that Paderewski has added Liszt's superb sonata (which Pachmann considers the greatest of all sonatas) to his repertory, and it is to be hoped he will play it next season on his American tour also. His interpretation will doubtless prove a revelation and make many converts here, as it did in London.

Among the artists whom Mr. Wolfsohn has engaged for the next American season are Ernestine Schumann-Heink, who will appear at 150 concerts throughout the country; Josef Hofmann, who has just given twenty concerts in Russia, where he is the idol of the public; Fritz Kreisler, who is now the greatest of living violinists; the eminent baritone, Campanari; Louise Homer, and Alois Burgstaller.

Among the famous artists who will tour this country next season under Mr. Loudon Charlton are Sembrich and Gadski, both of whom will sing at concerts as well as in the Metropolitan Opera House, and Leonora de Cisneros. Harold Bauer also returns under his direction; so does Rudolph Ganz. Among the Americans on his list may be mentioned Clara Clemens (daughter of Mark Twain), Marie Nichols, the Boston violinist, and David Bispham.

Art.

The History of Painting, from the Fourth to the Early Nineteenth Century. By Richard Muther; authorized English edition, translated from the German, and edited with annotations by George Kriehn. 2 vols. Illustrated. New York, G. P. Putnam's Sons. $5 net.

Dr. Muther's elaborate "History of Modern Painting," or, as it should have been translated, History of Painting in the Nineteenth Century, is already well known to readers of English. We now have this briefer "History of Painting," which begins at the beginning, as far as modern art is concerned, and leaves off where the larger work began. The book, in its English dress, is not free from minor errors, faults of translatiou or of proofreading, perhaps, but they are not of sufficient importance to need pointing out. Its graver faults, if faults they be, are due to Dr. Muther's method. They are what seem to us the faults of broad philosophical generalization based on erroneous or insufficient premises—the faults of a man who would take a large view of things without allowing himself to be hampered by inconvenient or tedious facts, who would, in a word, evolve his camel from his inner consciousness. Of course, we do not mean to accuse Dr. Muther of ignorance of art-history—indubitably he has a store of learning—but he seems to us too ready to conceive a theory and to bend his facts to fit it, to be brilliant rather than accurate, fanciful rather than sound.

The author's method is "to explain from the psychology . . . of each period its dominant style and to interpret the works of art as human documents." Every work of art is, to him, the outcome of the state of soul of an epoch, a part of a great world movement, and individual differences of temperament and character in the artists apparently count for very little. The works were what they were inevitably, and because the time was thus and so; and it would almost seem from his account that the artists might have been shuffled about in time and place a little and have produced each other's works accordingly. Not that place counts for much. One of his peculiarities is to drive all the schools

abreast through the centuries, skipping from Flanders to Italy and back again to Germany in a way somewhat confusing to an unagile mind, in the belief that the characteristics of a time were essentially the same on either side the Alps. At one time art was everywhere realistic, at another mystic, at a third grave and dignified, because of the spirit of the age and with no apparent allowance for racial character, or for slowness of communication.

The religious art of Perugino and of Botticelli, we are told, was part of a wave of puritanism that passed over the world, a herald of the Reformation, which found its dominant figure in Savonarola; and there is great ingenuity shown in the way in which the sadness of Botticelli's Venuses and Floras is made out to be essentially religious—the spirit of Savonarola speaking before his advent. One would imagine that a pagan sadness were inconceivable, or that an artist might not draw Venus and Madonna alike, sad faced, because that was the only way he could draw a face; because that particular expression appealed to his personal feeling for beauty as no other could.

After the epoch of Savonarola comes a reaction in the direction of sensuality, of which Leonardo is the great initiator, to be followed by the art of the majestic and the titanic. Then comes Raphael, the *profiteur* according to Muther, and then the decadence. Each of these, we are to believe, was a distinct period, for "all great epochs are pervaded by one artistic tendency, which permeates uniformly all expressions of life. As the men build, move about and clothe themselves, so also do they paint." And therefore the men of one-half of a century have an entirely different idea of beauty from those of the other half. Now see how it works out. The "sensual" school (sensuous would seem a fitter translation) is traced, in several chapters, through the followers of Leonardo, including Giorgione, to Correggio, who, fittingly enough, is characterized as marking the "acme of the age of triumphant sensuality." Then we reach Titian, and finally Michelaugelo, and only after that do we come to Raphael and the end of the Renaissance, the beginning of formalism. And what have dates to say to all this? They inform us that Correggio was much the youngest of the four painters just named, having been born in 1494, that he was only fifteen years old when the first half of Michelangelo's ceiling of the Sistine was shown in 1509, and that he outlived Raphael fourteen years. Michelangelo and Titian, it is true, lived so long that they may, in a sense, be considered artists of a later time than Correggio; but even Titian had produced the greater part of the work by which he is most certainly immortal, including the Pesaro Madonna and the lost Peter Martyr, before Correggio died in 1534; and Michelangelo had definitely said what he had to say as a painter when the scaffolding was finally removed from the Sistine ceiling in 1512, Correggio being but eighteen years of age at the time. What has become of the successive epochs and the "one artistic tendency" which permeates each?

In reality there were in the high Renaissance, as there had been earlier and as there have been since, several artistic tendencies coexisting at the same time. Above all, there were personalities, individuals of one or another temper, with one or another way of looking at nature and art, melancholy or joyous, sensuous or spiritual, energetic or placid. Michelangelo, Giorgione, Titian, Raphael, Correggio, were born within nineteen years of each other, and were in the strictest sense contemporaries, though Michelangelo was the oldest and the most intimately connected by training and manner with the art of the preceding generation, as Correggio was the youngest and the nearest to the decadence in his style. Locality had far more effect on them than date, the difference between a Florentine and a Venetian environment and education certainly counting for more than the difference of two years in age between Michelangelo and Titian. But their differences were fundamentally differences of temperament. Their age tinged them; it might encourage or thwart them; but it could not radically alter them. By no conceivable change of circumstances or dates could Michelangelo have produced the work of Correggio or Correggio the work of Michelangelo. Either of them might, perhaps, have been prevented from producing any work at all, but if his work was to be produced it must have been much what it was in essential character, however inferior in mastery.

Even Dr. Muther finds it impossible to account for Rembrandt as an exponent of the time-spirit. Never was a man so frankly at odds with his environment, so evidently personal in his point of view. His age could not understand him and let him die a pauper; and his immediate successors, when they remembered him at all, treated him with scorn. A great poet in an age of prose, a romantic individualist living among rank materialists, he is, of all the great masters, the one least explicable by *a priori* reasoning. Not the sombre Rembrandt—not even the delicate Vermeer or the gentlemanly Ter Borch—is the representative man of seventeenth century Holland. Stolid, bourgeois Bartholomaius Van der Helst, and tidy, painstaking Gerard Dou were the painters their countrymen and contemporaries delighted to honor.

In the case of Rembrandt, then, Dr. Muther abandons his "psychology of a period" to replace it by the psychology of an individual. He endeavors to account for Rembrandt's works by the events of his life and their probable effects upon his moods, building up a series of minute correspondences which it is difficult to believe in. He will have it that Rembrandt was always his own hero, even when he deals with the life of Christ. He is Samson Destroying the Temple of the Philistines when he scorns the bourgeois taste of those about him, and the sale of his effects suggested the Christ Exposed to the People. As in the generalizations about the Renaissance, dates are not allowed to stand in the way. The "joy of a student coming from the constraint of the paternal roof into a strange city" is made to account for "sheets of coarse sensuality," the worst of which date from 1640, the year before his wife's death; and his marriage, in 1634, "gave occasion for the picture Samson's Wedding," which was painted four years later. Still, it is possible that Rembraudt was thinking of his own wedding when he painted Samson's. But did the bankruptcy of 1656 and the sale of 1657 cast their shadow before, that he etched the Christ Exposed to the People in 1655? Of course the truth is that the mingled strains of Rembrandt's nature come to the surface here or there with no ascertainable cause, and that every kind of subject that he treated appears indifferently at every period of his life. His coarseness was as much a part of him as his sentiment, his picturesque realism as his penetrating and sympathetic imagination. It is only in the most general view that one can trace the development of his mind, finding him, in his earlier time, more content with mere picturesqueness, while his later work is more imbued with imaginative power.

Two more specific instances may be given of the way in which Dr. Mutber's readiness to theorize blinds him to plain facts. They are descriptions of particular pictures and, in each case, he has seen what he expected to see, not what is actually there. The first is of a picture by Piero de Cosimo, at Chantilly, which he calls "his uncanny Cleopatra, the nude woman with the Oriental shawl, about whose necklace a greenish-yellow snake is curled," and of which he says:

> One feels that a man in whose soul a chord has snapped painted this picture; so shrill is the dissonance between the tropical, exuberant character of Cleopatra and the desolate hungry landscape with the withered trees presented as a background; so devilish is the contrast between this pale profile and black masses of cloud which gather behind it.

Now, apart from the fact that the dead trees were favorite objects with Piero, who introduced them into his most joyously pagan scenes, and can therefore have no special significance here, the picture represents no Cleopatra, but is a posthumous portrait of Simonetta Vespucci, painted for the Vespucci family, delicate, spirituelle, almost ethereal, with high shaven forehead and meagre undeveloped breast, a consumptive who died young. But Dr. Muther wanted to show that "the lifeblood of Piero's art had been sapped by Savonarola," and he invented a picture to show it.

In the other passage our author is contrasting the "rude bacchic sensualism" of Rubens, whom, by the way, he profoundly misunderstands, with the "elegiac sadness" of Van Dyck, as shown in their respective versions of the story of Susanna:

> In Rubens's version a corpulent woman sits before us—a blue-eyed, fair-skinned Fleming; sparkling red and gleaming white are the prevailing notes of the color-scheme. Van Dyck painted a lithe, black-haired Italian whose dark southern beauty gleams like gold from a deep brown landscape. While with Rubens a gigantic athlete springs over the wall to overpower the woman; in Van Dyck's picture both gentlemen are careful to preserve good form. One tenderly strokes her arm, while the other looks ardently into her eye and vows his love by Cupid.

It is very deftly done, and the "gigantic athlete" is an especially telling touch. But he is not in the picture. It is a well-known composition—there is a school copy of it in the Metropolitan Museum—and the Elder who is climbing the wall is a grotesque piece of senility with a waggling beard—a "lean and slippered pantaloon."

But the final objection to all this psychological criticism is not that the psychology is sometimes doubtful or that the facts are sometimes wrong; it is that it is all so detached from the actual and

the material, so oblivious of painting as a craft with material limitations and particular processes. You would imagine that pictures were painted with mind only, not with brushes and pigments. It is all well enough to dissect the soul of an epoch, but how about its means and methods of expression? The technical knowledge and the technical methods of any age are at least as necessary to understand as its way of looking at life, and have, perhaps, a greater influence on its artistic product. The technical ideal of a given artist determines not only his way of saying things, but what he shall attempt to say. To write a history of painting that shall ignore even such gross things as grounds and vehicles—to discuss Rembrandt without reference to light and shade, and Hals without speaking of handling—this is to build in the air. The house lacks underpinning.

Finance.

The Seventh Financial and Economic Annual of Japan, issued by the Department of Finance, and printed at the Government Printing Office in Tokio, is a large pamphlet (pp. 195) with an appendix of thirty pages on the financial affairs of Korea, now a Japanese protectorate. Preliminary statistical matter, ingeniously constructed in comparative form and with colored diagrams, a map showing all the railways built or in process of construction in Japan and Korea, and the very full descriptive part of the work form, altogether, a valuable cyclopedia of contemporaneous Dai Nippon. The budget for 1907-8 is presented in detail with comment and explanation. The forty pages treating of revenue, expenditure, taxes, and various debts and loans, are followed by a chapter on agriculture, industry, and commerce, which shows the tremendous development of natural products, along with the growth of manufactures, industries and commercial and monetary associations. Part III. deals with foreign trade. The chapter on banking and the money market reveals the facilities for borrowing and lending in Formosa and the northern islands, as well as in old Japan proper. Part V., on communications, gives the detail of railways, telephones, posts, steam traffic and navigation. The last chapter treats of Formosa and Saghalien, the former island being now entirely traversed by a trunk line with branches. In Saghalien, what is set down in this annual as promised, is now, according to a recent number of the Japan *Mail*. fulfilment, a short railway and a long telegraph being already in operation. The historical account of the financial system of Japan is interesting to those who remember the diversities and confusion of feudalism. Finance and economy in the (Chinese) province of Kwan Tung is also dealt with in outline. In Korea, where finance has hitherto been a slough of despond and the "budget," beginning in 1905, one in name only, there has been building up, rather than reorganization. The alleged official Korean figures are here given, and advance made in bringing the currency into a state of stability and uniformity is shown in tables. Hitherto it has been necessary, when one went on a long journey in Korea, to have one or two of the strongest horses to carry the strings of perforated iron and copper cash. Gradually the new coinage struck at Osaka is driving out the old cast iron tokens, which were avoirdupois and merchandise rather than money. The new mintage is in gold, silver, nickel, and bronze, and this, with bank notes, the amount of reserve against the notes issued being duly stated, gives promise of rapid reform. It is only recently that the Koreans have had any conception of regular banking business; but now, in addition to three city banks organized by natives, and four by Japanese, there were in February, 1907, ten agricultural and industrial banks— a number recently increased to thirteen. Business is further stimulated by promissory notes and note associations under proper regulations. Thus the documentary expedients for facilitating business, known in Japan for at least four centuries, are becoming common in the peninsula. Korea's economic resources are based on agriculture, the principal product being grain. The population of Korea is not very large in proportion to the arable area, and when land be-

Financial.

Convertible Bonds

In the third edition of our 6-page circular, entitled "Convertible Bonds," we describe practically all of such investments now upon the market. In addition, we explain why such bonds, when properly selected, are well regarded by conservative investors, and also why they possess every probability of returning exceptionally large profits.

Properly selected investments are based upon safety and income yield combined; in other words, minimum risk of principal and maximum income return.

NOW READY *A NEW WORK ON ORIGINAL LINES*

AMERICAN RAILWAYS as INVESTMENTS

By CARL SNYDER

The Great Groups and Their Allies **Their Territory** **Their History** **Their Capitalization**
Earnings and Surplus **Stability of Traffic** **Who Owns Them** **Who Runs Them**
Recent Improvements **Their Condition** **Their Resources** **Their Future**

WITH AN EXTENDED INTRODUCTION ON

THE METHODS OF ESTIMATING RAILWAY VALUES

THE Railroads of America are not owned by millionaires, but by from one to two million investors, large and small, whose average holdings are probably less than $8,000 each. The present work is designed for the use of these investors and for the investment banker and broker who serve them. It covers about 190,000 miles of road, or about 90% of the total in the United States. It presents a detailed and comprehensive analysis of all the larger roads, nearly 100 in number, and estimates the comparative safety of their bonded securities, and the present and prospective value of their shares; in the belief that these present a greater degree of safety with a larger opportunity of profit than any other form of property in which the investor may place his funds. The book is written in untechnical language, for the general investor, is wholly unbiased, and is prefaced by an elaborate introduction on the methods of estimating railway values. There is no other work in the market like it, and the publishers believe it will meet a widely felt demand.

Royal Octavo. Handsomely Bound, 762 pages. Price, $3.20 net; by mail, postpaid, $3.40

London: Frederic C. Mathieson & Sons, 16 Copthall Avenue, E. C.

comes unproductive, new fertile lands are easily found. Thus in spite of unprogressive and wasteful methods, there is usually plenty of food. With large mineral wealth and the marine products from the three sides of the country, it seems as if nothing were needed but right spirit and management. Of the exports in 1906, more than one-half consisted of gold, mined chiefly by Americans. Of the imports, one-fourth were in railway material. In 1904, the war year, railway equipment made one-half. The Japanese railway from Fusan to Wiju traverses the entire peniusula from southeast to northwest.

The growth of schools of commerce has created a demand for a class of works of which S. E. Sparling's "Introduction to Business Organization" (the Macmillan Company) is a representative. The author of such a volume must perforce undertake a good deal of pioneer work, and Mr. Sparling has set himself a decidedly difficult task. After a brief introduction, the material part of which treats briefly of partnerships and corporations, he discusses what he calls the "principles of organization" in extractive industries, in manufactures, and in distributive industries. A considerable amount of information, much of which is not available elsewhere, is here brought together; and to the studeut there is given a general view of the field of industry highly desirable for him to have. The only proof of the pudding is the eatiug, and the only test of a pioneer book in a new field is that of actual class-room use. But it would seem that Mr. Sparling has performed his difficult task with reasonable success, and has produced a volume that will go far toward meeting a genuine want of students of commerce.

Until very recently American Socialists have been permitted to hurl their denunciations at the capitalistic system of industry and to dream of their coöperative commonwealth without encountering much systematic criticism. This, doubtless, was due to the fact that to the average orthodox economist the game did not yet seem worth the candle; but our Socialist friends seemed to take it as proof positive that their arguments admitted of no answer. Professor Le Rossignol of the University of Denver has at last taken up the cudgels for economic truth; and in his "Orthodox Socialism" (T. Y. Crowell & Co.) undertakes a general criticism of Karl Marx and his tribe. He passes in review the labor theory of value, the "iron law of wages," the class struggle, the materialistic interpretation of history, and the predicted bankruptcy of capitalism; and finds the Marxian philosophy weak at all its cardinal points. Writing for the general public and not primarily for the student, he has confined himself to the more general aspects of his subject, and within these limits has acquitted himself with credit. We agree with him in thinking that it is time for the ecouomist to challenge the propaganda of the Socialists, and can recommend his book to any who are looking for rational criticism of their schemes.

F. W. Blackmar's "Economics" (originally published by Crane & Co., in 1900) has been brought out in new dress, but without material changes in substance, by the Macmillan Company. It aims to "cover the entire field" in some 500 small pages, with the result that it is greatly condensed and cannot devote sufficient space to the elucidation of the most important and difficult problems of the science. Four short pages are insufficient to present for any reader, particularly a beginner, the theory of international values; and it would be better to omit the tariff question altogether than to try to dispose of it in three pages. Not a few typographical errors are to be found in the book.

The Nation.

NEW YORK, THURSDAY, AUGUST 1, 1907.

The Week.

Massachusetts Democrats have seen the great opportunity of their party. Their slogan is to be tariff reform, no matter to what idiocy the national "leaders" may commit themselves. In this the Bay State men show only ordinary political acumen. The Quincys, Hamlins, Gastons, and Whitneys are insistent that this ought to be the only issue in next year's national campaign. They see their State seething with unrest, out-and-out Republicans clamoring in vain for action by their own party, and are rightly convinced that this is the sole issue upon which the Democrats could expect to win over many votes. People are everywhere becoming alarmed at the increased cost of living. Protection statisticians may show to their heart's content that the net average rise is small, but it is big enough to make itself felt by every salaried man in every branch of trade or business. The Republican party never has revised the tariff, save upwards. It is not likely to do so, while the protected manufacturers from whom it has extracted so many of its campaign funds have it by the throat. Here is the American Protective Tariff League, long an annex to the party, declaring the reciprocity agreement with Germany contrary to the statute law, and that higher unwritten law—the policy of protection. It and its friends may well think they can dictate to the party; they have done it many times before.

One fact has undoubtedly had much to do with the endorsement of Taft by the Republican Committee of Ohio. That State sees a chance to elect a President once more, and hence the tremendous pressure put upon every hesitating committeeman. Ohio is weary of the prominence of New York in Presidential politics. She longs for another favorite son in the race. Accordingly, if the Taft managers can make it appear that their man has good prospects, the clamor for "one more President from Ohio" will be such as few politicians can resist. This is the strong force making against Foraker and Dick. They have, to be sure, many members of the machine bound to them by patronage, but the promise of still richer patronage, to say nothing of the greater glory of the State, is on the other side. Taft may not be the pride of Ohio, but Ohio pride is his best weapon in the fight for the State delegation.

North Carolina is not going to secede again. Senator Overman declares that, while the people of his State are "highly incensed," they understand that the legal questions at issue must be settled by the highest court in the land, "in whose decision our people will cheerfully acquiesce." Congressmen Page and Gudger give similar assurances, though they really were unnecessary. It is also made clear that the angry talk about impeaching Judge Pritchard was mostly a product of the dull and silly season in the offices of Washington correspondents. That Federal judge proceeded in the exercise of a discretion which is undoubtedly his, under the Constitution and laws of the Union. He may have been mistaken. That will appear on appeal. But that there should exist such recourse as a United States writ of injunction against the confiscation of property by State action, no man with a full complement of wits will deny. Only in that way can what may prove irreparable injury be prevented, and the equal protection of the laws assured to all. It is a railway corporation which, this time, avails itself of the remedy. Next time, it may be a widow whose property it is proposed to take from her without due process of law. The full merits of the North Carolina case will be passed upon by the Supreme Court. Pending its decision, all good citizens will be orderly and submit to the law. North Carolina has enough sensible inhabitants to outweigh her crazy politicians and to make it certain that she will so submit. Even Gov. Glenn has now assented to the compromise arranged between the parties to the suit, which is to be pressed to a speedy determination.

So much is heard about the large sums spent by the white people of the South for the education of the negro, that a recently published analysis of South Carolina's outlay has exceptional interest. For the year ending June 30, 1906, there were enrolled 147,053 white pupils in 2,674 schools, with 3,633 teachers. The average session was 24.35 weeks. The salaries of the white teachers averaged $253. The whole cost of educating the white children was $1,538,565.13, including the cost of the five State colleges maintained or aided. The enrolled negro children numbered 171,022, or 24,000 more than the whites, but the total appropriation for them was $259,932.86, or only one-sixth of the sum appropriated for the whites. Now, of the total school taxes for the year, $278,477.16 was paid in by negroes, so that, so far from any whites contributing to the education of the blacks, $18,544.30 of the latter's money went to the education of the white children! Not unnaturally, this seems somewhat unfair, particularly as the average salary of the negro teacher for the 14.9 weeks of the session is only *ninety-five dollars!* If this same ratio holds for the other States, or anything approaching it, those public men in the South who have so long urged that school money be divided among the races according to the taxes paid, will have to do some more figuring.

Senator Foraker found it easy to reply to Senator Tillman's untruthful assertion that the North fastened the Fourteenth and Fifteenth Amendments to the Constitution on the country because its "passion and sectional hatred" had "gone far beyond the bounds of reason, decency, and righteousness," and that its real motive was to assure social equality to the negro. Tillman knows better, but relies on the fallibility of the human memory. As a matter of fact, the Fourteenth and Fifteenth Amendments were born of actual conditions in the South; they were necessitated by deliberate legislative attempts to reënslave the negro. The average Southerner who maintains that the South alone should deal with the negro, and that it can be trusted to do the right thing by him, either conveniently forgets this chapter in Southern history or is honestly ignorant of it. But the facts are available. Carl Schurz, for instance, when still a major-general, in his tour through the South in 1866, perceived what was happening, and his report to the Government is most enlightening reading just at this time, when such men as Gov. Vardaman are declaring for the repeal of the amendments.

In the final report of the Civic Federation's Committee on Public Ownership, published on Monday, it is stated, a trifle solemnly, "We are unable to recommend municipal ownership as a political panacea." This will, with many, damn the report. If they can have no device to save them from being careful and watchful, from having continually to experiment to discover what is good, from varying plans and methods with varying conditions, and from doing the full duty of a vigilant citizen—why, they will none of it. There prevails an immense demand for political nostrums, and if this able committee spent so much time and money only to report that they have been able to find none, their work will be severely mauled by reformers impatient of facts and of human nature. Real students of the problems involved, however, will be inclined to think that the very caution of the members of the committee, and even their disagreements

among themselves, prove the serious and painstaking nature of their inquiry. If they had brought out any kind of panacea with a great flourish, sober people would have distrusted them. That they confess to the same difficulties as other investigators, and admit that different men look at the same facts in different ways, is at least an evidence of their sincerity.

There appears to be a concerted and rather amusing attempt to manufacture prosperity by newspaper interview. It seems to be thought that if a lot of nonentities, or interested speculators, only shout loud enough that prosperity is bound to continue and be greater than ever, somehow crops will improve, money will be made more abundant, business men and bankers will cease to be cautious, investors will flock to Wall Street, and "melons" will be cut and lambs sheared as before. Some of the means adopted are surely comic. J. Ferguson Jones of Terre Haute arrives at Bad Nauheim in his automobile, and takes occasion to say that, in his judgment, and he knows it to be good, American prosperity is going speedily to mount to new and dizzy heights. This is at once cabled, and printed with great display, as a convincing "bull" point. Monday's stock market unfeelingly slumped right in the face of whole broadsides of such views of unknown financiers. It may recover, but, if it does, we have a notion that it will not be because T. Washington Andrews of Fargo declares in Cairo that he thinks it ought.

Shan F. Bullock complains that literary criticism is becoming namby-pamby. "Considerateness" is the prevailing fashion in it. One English journal, noted for its trenchant reviews of books, was rebuked for its harshness the other day by a brother editor, who innocently observed that the publishers would soon cease sending volumes for notice, if nicer things were not said about them. Critics must be "considerate." This is a variant of the old phrase to the effect that they must be "constructive." Honestly interpreted, that meant that the author must be coddled, not told of his faults; and that the public must be fed on sugar-plums, not warned of impure or indigestible food. Considerateness, as Mr. Bullock remarks, is a most excellent thing. We ought all to be as kind as we can. But there are higher virtues, sterner obligations. One of them is to be sincere. And if a critic feels that he is set for the defence of the truth, and has a literary standard to maintain, instead of merely making himself a bait for advertisements, he will often discover that the truest kindness is to be severe. The older and more savage criticism may have sometimes been unfair, but at any rate it was never insipid or dull. This cannot be said of the new style of "considerate" criticism. It may create new geniuses every week, out of the most unpromising material, and may note the appearance of twenty masterpieces in a single publishing season, but it certainly does cloy one. It makes many of us look back, with Mr. Bullock, "longingly" to the old "ramping days of Henley," the "roaring Nineties," when "the artists of the rapier and the bludgeon had their way."

For young men without means who are educating themselves, there are now many ways of self support. At the University of Chicago, for example, where there is an employment bureau, the students last year earned, without interrupting their college courses, more than $66,000. One of them had a salary of $3,000! As there are women at the university, we find among the occupations mentioned as a means of profit "watching babies." For many years, of course, students have worked during the summer in various occupations; but now the automobile affords a paying and little irksome employment. Students with good habits, good manners, and a fair knowledge of machinery might easily be able to make enough in their vacations to pay their expenses for the year. We hear of some who are doing so. If the work of the chauffeur were to be taken up more frequently by college students, it would be good for them, and might even be better for the owners of machines.

The great objection to attempting renewed comment on so worn-out a topic as monkey-dinners is that, after a while, the guests of honor, like the central figure at Friday's Newport affair, must come to feel the irksomeness of excessive publicity. We may take it for granted that among leading chimpanzee families the reading of journals is not a neglected accomplishment, and, notwithstanding all the delights of new experiences, Consul I. must be sensitive to what may be said in the best Primate circles about indiscriminate elbow-rubbing with society which cannot deny its *parvenu* character, in view of its inability to point to more than a hundred thousand years of descent. Prejudice is hard to conquer, and when anthropoid dowagers shake their heads over the performances of the sad dog of a *déclassé*, it wil' do Consul I. little good to argue, *Nihil humani a me alienum puto*, to maintain that, after all, no wide gulf separates species from species. Are not their thoughts largely my thoughts? he might assert; their actions my actions, and their views of life very much my own? Then why set up empty barriers of pride, or, if *homo sapiens* sometimes becomes merely *homo soupiens*, why be over-critical?

British proposals at the Hague Conference have notoriously been unsatisfactory to the enlightened sentiment of England. Severe condemnation has been expressed by some of the best newspapers, particularly of the refusal of the British delegates to agree to immunity of private property at sea in time of war. As if nettled by this criticism, Lord Reay suggested last Friday the entire abolition of contraband of war. The proposal could hardly have been sincere. It was not accepted as such by the other delegates, some of whom pointed out that it went ill with the British clinging to the doctrine of prizes and stringent blockade. If there is no contraband, how can prizes be made of neutral ships? Also, how can they be shut out of a belligerent's ports on the ground that they are "helping the enemy"? The whole debate but illustrated the unhappy fact that the official representatives of Great Britain at the Hague Congress have not been abreast with the most humane sentiment of even their own country.

Colonial Preference still keeps up its old reputation for providing humorous incidents. In the debate on it the other day in the Commons, a Liberal member referred to Mr. Chamberlain's plan of getting the Colonies to agree not to found industries which might seriously compete with those of England. Thereupon Austen Chamberlain started up to deny that such a passage could be found in any of his father's speeches on Colonial Preference. A newspaper report was at once produced, however, in which Mr. Chamberlain's very words were: "They [the Colonies] will arrange for tariffs in the future in order not to start industries in competition with those which are already in existence in the mother-country." Then Son Austen made an ingenuous explanation. His father had found that the sentence quoted had "given rise to a misapprehension," and therefore it "was omitted from the published copy of the speeches." Turning to the said published copy, we discover the original language changed so as to read: "They will give us, in the first place—I believe they will reserve to us—*much*, at any rate, of the trade which we already enjoy." The little less, and what worlds away! Mr. Chamberlain exclaimed loftily, on one occasion, "What I have said, I have said." It does not follow, apparently, that what he has said, he has printed.

A visiting American lawyer in London passes severe censure on English law courts and jurists. "The judges

were too advanced in age and were apparently not men of the world. They seemed insufficiently experienced in every-day life and every-day business. They simply sit in judgment and lay down the law just as it was administered hundreds of years ago. A judge elected to the bench in America is invariably a man of the world, with wide human knowledge, a man of modern life. Altogether, British legal machinery impressed one as insufficiently up to date." It is obvious that these criticisms are well founded. English judges are still under the impression that a prisoner brought up for trial should be either condemned or acquitted, instead of being allowed to die of the gout in jail while awaiting his fifth trial. The judges across the water are hundreds of years behind in their attitude towards triumphant science, for it is on record that they will actually interrupt an expert in the witness-chair even while he is engaged in making an ass of himself. With an utter lack of worldliness, English judges do not take a leading part in gigantic clambakes, beefsteak dinners, or potato races for fat men. And, worse than all, they are not up even on the rudiments of the Law of the Previous Fist, sometimes known as the unwritten law.

A certain straining of the Franco-Russian alliance is making itself felt in the press of both countries. The *Novoye Vremya* of St. Petersburg has been bitter in denouncing the attitude of the French governing classes towards Russia's internal problems, and has seized upon the recent mutiny of a regiment in the Midi as a text for arguing that the morale of the French army is such as to render it of doubtful value to an ally in time of need. Moderate French opinion admits that the policy of the Radical cabinets which have been in power since the outbreak of the Russian revolutionary movement has been indiscreet to the point of irritation. It was not for the French Ambassador at St. Petersburg to offer advice to the Government on the matter of dealing with internal problems, and, on the other hand, last year's revelations of the part played by the Russian military attaché at Paris in the campaign against a revision of the Dreyfus case was not likely to further close relations between allies whose knowledge of each other's military arrangements should be more intimate than they actually are. Still, the Paris *Temps* insists that there is as much reason as ever for the maintenance of the dual alliance, and characterizes the situation as something of a quarrel between domestic partners, in which either disputant is carried away into saying the bitterest possible thing about the other. "We have lent you the money to keep things going," cry the French. "Because you were out for a high rate of interest, and your own good," retorts the *Novoye Vremya*. Whereat the *Temps* asks calmly, "What harm if both things are true?"

What has become of the French nobility and what are its pursuits, are questions much discussed in the Parisian press, apropos of Paul Bourget's "Emigré." Under the Republic, few of the aristocracy join the army or navy. They are generally much richer than before the Revolution. Many have married into commercial families, and many have themselves entered active business. One marquis of distinguished lineage is a champagne agent at Epernay; another nobleman sells fish. There are titled manufacturers of cider, automobiles, and pumps. One blue-blooded baron is a distiller. If the aristocracy were only numerous enough, we might soon see all trades associated with the names of the peers of France; while the only gentlemen of leisure would be those who are now *commerçants*. A general strike headed by a duke, with a marquis bearing the red flag of the Internationale, would furnish a thoroughly modern spectacle.

The proposal to erect a statue of Zola in Paris on the Boulevard Haussmann has given rise to an acrimonious dispute. In particular, M. Escudier, a municipal councillor, has protested vigorously. The opposition is partly political, manifested by the anti-Dreyfusards; and partly moral, directed against Zola's naturalism. The *Figaro* prints a curious article approving the councillor's protest. It argues that, just as living persons may not fight in the streets, so effigies of the dead, which might incite to riot, should not be placed on a boulevard. It would have them isolated in a park, academic hall, or museum. Yet this would simply transfer the disturbance from one place to another. Of course, the French are peculiarly sensitive in the matter of public monuments. Would that we in New York had been so! But we should hope that the passions of the Dreyfus time might soon subside to the point where a statue of Zola, inscribed with his famous words, "J'accuse," would excite no anger in any rational breast.

With the speedy annexation of the Congo by Belgium no longer open to doubt, the conflict between King Leopold and his opponents centres about the character of the new colonial law that is now under discussion. The question involved is whether, under the new régime, the Congo, though Belgian, shall continue to be administered by the King in all matters legislative and executive, or whether the African domain shall be placed under parliamentary authority. The actual government bill assigns the power to the King, whose acts must be countersigned by a member of the Cabinet. A complete report on every phase of the colonial administration must be laid every year before the Belgian Chamber, which may then call into question the procedure of the Congo administration. At all other times, the Chamber cannot occupy itself with debates or interpellations on the colonies without the consent of the Colonial Minister, who is to be named by the King in the same manner as the rest of the Cabinet. A Colonial Council of four members, nominated by the King, is to assist the sovereign in such matters as he may submit to its consideration. A separate colonial budget is to be maintained. It is the composition of the Colonial Council that constitutes the debated point. The Opposition demands a council of fifteen, of whom only the head shall be named by the King, four by the Chamber, four by the Senate, and the rest by various high governmental and judicial bodies. Without such guarantees, it is argued that annexation would only result in saddling the country with the odium of a régime which will, so far as personnel and aims are concerned, remain what it is at present.

Japan has finally assumed direct control in Korea. Such an outcome has long been inevitable; and it has been only a question whether the Mikado's Government would succeed in treading the usual road from a "friendly agreement" to virtual sovereignty with the least amount of irritation to the Korean people and a minimum of foreign criticism. Neither of these the Japanese have avoided, but on the other hand they seem to have traversed the present crisis without serious opposition in Korea or abroad. It remains to be seen whether her complete grasp on the Government machinery of the "protected" empire will enable Japan to steer a smoother course than heretofore. There is no need for the expenditure of excessive pity over the misfortunes that have befallen the imperial house of Korea. In the Orient, especially, people have been content since time immemorial to see the appearance and the reality of power vested in different hands. To the Korean people sympathy will be due when it is apparent that foreign rule has not raised them above the wretched condition to which centuries of the worst kind of domestic misrule have brought them. The very obstinacy with which they have resisted the Japanese advance, themselves without an efficient leader, or an army, or any other resource but the hope of possible foreign interference, would show that there is good material among them which an efficient government might mould into something like a real nation, as Great Britain has done with the Egyptian fellaheen.

HAYWOOD'S ACQUITTAL.

Few expected that the jury at Boisé would find Haywood guilty. Apparently, the most that the prosecution hoped for, at the end, was a disagreement. The verdict of acquittal, we do not doubt, was conscientiously given. The trial had been eminently fair. Every legal latitude had been given by the presiding judge to both sides. But proof of conspiracy is notoriously hard to make in court. And there was not forthcoming that full corroboration of Orchard's extraordinary confession which was necessary in order to give it due moral and legal weight with the jury. Judge Wood's instructions on that point are said to have inclined the jury to acquit. But they were sound law. The testimony of an accomplice peculiarly requires to be corroborated. And as no one ever charged that Haywood was even present at the murder of Gov. Steunenberg, and as the indictment against him was merely for conspiring to murder, it is not strange that the jury felt itself unable to condemn him to death on the evidence. We believe that the verdict will be generally accepted as one that, legally, ought to have been rendered.

This is not saying that Haywood should not have been arraigned, or that his long trial has been nothing but a failure. Moral results are often more valuable than legal findings; and the indirect moral consequences of this Haywood case are of enormous public importance. We can no longer charge him with personal guilt. A jury of his peers has found him innocent, in the eye of the law. But there is no doubt whatever that he belonged to a guilty, a murderous organization. The demonstration made of the methods of the Western Federation of Miners is one that stands, irrespective of the fate of the particular officer of it on trial. This story has been burned into the imagination and memory of the whole country —we may say, of the world. The fact that a labor union had for years made of itself a sort of terrorizing Mafia in five States, using guns and dynamite for argument, and murder for persuasion, has now been established up to the hilt. The Haywood acquittal has been called a "triumph for labor." Perhaps; but it is certain that the evidence brought out in the Haywood trial has affixed the blackest stigma to one branch of organized labor. To say Western Federation of Miners is to-day very much like saying the Camorra, or the Black Hundred.

In fairness, we would not deny that the lawlessness of the miners has been met by the lawlessness of the mine-owners. Brutality always breeds true to type. Murder provokes murder. Not till the whole story comes to be told, shall we know what a veritable reign of terror afflicted the mining regions for many years. Force was met with force. The "bull pen" was the rival of midnight assassination. Capital was as unscrupulous and as law-defying as labor. Brigands on one side were faced by bandits on the other. Due process of law was as much unknown in the mountains of Idaho and Colorado as in the mountains of Thessaly. It was a terrible period of ferocity, open assault, and secret murder, through which that section of the country has had to pass. The annals of Irish cruelty or Turkish fiendishness could scarcely exceed the misery and horror of those days of the reign in the mining States of tooth and claw.

Happily, we may now believe that a better day is dawning. Violence is both glutted and ashamed. The Federation of Miners has had its exposure and its warning. Scheming and ruthless mine-owners have been recalled to their senses. This great, orderly trial at Boisé must have a powerful effect in impressing upon men's minds the real bulwarks of justice, with the true safeguards of property. The law, impartially administered, is a better weapon for the maintenance of the right and the giving to every man his due, than bludgeon or pistol or knife can ever be. That is the great lesson; and it has been bitten into the minds of those who most needed it.

To complete the salutary work, the prosecution of the other indicted men should be pushed at once. It may not be possible to convict all or any of them, but the duty of the State is clear. They should each speedily have their day in court. If the prosecuting attorneys have further evidence against them, or against the Federation of Miners, they should produce it. And, then, in due time, the State should proceed to the condign punishment of Harry Orchard. It has been stated repeatedly in the trial that no promise of immunity was made to him. Senator Borah declared that Idaho would mete out justice to this self-confessed murderer. Orchard himself has testified that he fully expected to pay the penalty of his crimes. If ever there were a candidate for exemplary punishment, he is the man. Unless he is an arrant perjurer as well as criminal monster, he will plead guilty and save the State the expense of a trial. In this, and all ways still open to them, the authorities of Idaho should see to it that justice be done with a high resolve to take away the State's long reproach.

WHAT IS THE MATTER WITH MINNESOTA?

This is extraordinary news which comes from the iron-ore region of Minnesota, where the big strike of the miners is in progress. The citizens have actually dared to assert themselves! In the town of Ely, they went so far, and were so recklessly willing to be called un-American, that they held a mass-meeting, denounced the strike, condemned the violence of the labor leaders, and guaranteed protection to every man who wanted to go to work. And it is even stated that "all classes" joined in these treasonable proceedings. To crown their unheard-of audacity, the "business men" of Ely next undertook to curb the activity of one Lundstrom, an "organizer" for the Western Federation of Miners. They let him know that they regarded him as a seditious person; and presently he was escorted to the train by "a jeering crowd," and sent away. From several neighboring mining towns, the dispatches tell of similar unprecedented action. Citizens are coming forward to be sworn in as deputy sheriffs in order to put down a mob of organized labor. At Hibbing—queer name, but queerer doings—the Governor of the State met the strike leader and told him that troops would be sent at the first sign of disorder.

Who can fail to rub his eyes as he reads? These revolutionary Minnesotans are upsetting some of our most firmly established social and political principles. They positively believe in work! And with an effrontery which we had fondly hoped that no good Americans would ever again display, they arraign the miners' union for breaking its contract. Yet the very children in our schools know that it is now well settled that only employers are bound by a contract. These authorities in Minnesota—mayors and sheriffs and the Governor—must be an ignorant set. And that they are absolutely crazy, politically, any public man, from Oyster Bay to San Francisco, could tell them. Why, there are as many as 10,000 strikers. Most of them have votes. That ought to be decisive. And as for running a labor leader out of town, did these rash citizens of Minnesota once stop to consider that the man might soon be invited to a luncheon at the White House? They did not know but that he might be filled with statesmanlike ideas, changes in the laws or the Constitution, which would enable us all to live without working. Yet this embryo Gompers or Mitchell had to leave amidst general jeers!

This is plainly all wrong. Something must be the matter with Minnesota. Any one accustomed to the usual American practice cannot but suspect that some strange foreign whimsey has got possession of these people. We turn to the census, and we find that nearly one-third of the population of Minnesota is foreign-born—505,000 out of 1,750,000. That surely means something. It is certain that no such vindication of manhood, and resentment of dictation and outrage by labor unions, could occur in a State where the native stock was almost pure—in North Carolina, for ex

ample, with only 4,492 foreign-born citizens. We have always feared that the great influx of Scandinavians into Minnesota boded no good, and now we see what it is leading to. If this goes on, our proud American tradition of knuckling down to organized labor, though it constitutes less than 2 per cent. of all labor, will soon be shattered. A further proof of the fact that Minnesota is wholly irregular, and really out of touch with the true American movement, is that she has, though normally Republican by a large majority, twice elected a Democratic Governor. People foolish enough to do that are capable of treating a violent labor union with disrespect. Moreover, they have absurd notions about the American tariff. They want it reduced. Gov. Johnson has been so wild as to say that tariff-revision is the chief issue in all the Northwest. Minnesota inflicted a crushing defeat upon one Representative, Mr. McCleary, who had the right idea about the sacredness and perpetuity of the Dingley tariff. This alone shows that the State is erratic and un-American; and prepares us to believe the worst about her rude trampling on the right of organized labor to intimidate and kill at pleasure.

In any case, something ought to be done. Minnesota's sister States cannot sit indifferently by and see her set up such startling innovations. Poison in the extremities affects the brain; and we may depend upon it that this bad example, far away though it be, will unhappily influence communities nearer the centre, unless steps be taken to counteract it. Why, if this Minnesota doctrine spreads, rioting and idleness may become unpopular elsewhere! If emphatic disapproval is not somehow visited upon the inhabitants of Ely and Hibbing, of Bovey and Taconte, a movement may start from those towns to insist upon workingmen being honest and earning their wages. Against such a threatening calamity, some vigorous measures ought plainly to be taken. There are various recourses. A Commission might be sent to darkest Minnesota. At the very least a Government agent should be dispatched—preferably Reynolds. As a last resort, a Presidential letter might be written; yet, grave as we feel the emergency to be, we do not believe it has reached an extremity calling for that desperate and little-used remedy. But, in some way or other, Minnesota ought to be given to understand that she is on the wrong track. For Americans to declare that their souls are their own; that they will not allow a great industry to be ruined by agitators; that the laws must be obeyed even by union organizers; that any man who desires to work will be protected by the whole power of the State—this will never do! Minnesota must somehow be led to see the error of her ways.

THE "MONARCHICAL INSTINCT."

Albert Vandal, whose studies of the rise of Napoleon have conquered a name for him among historians, returns to his subject in a close analysis of the man as he was at thirty, First Consul of France. He has utilized the unpublished "Eclaircissements" of Cambacérès, who described in great detail the daily routine and the intellectual and political methods of the young general setting out deliberately to make himself master of France. Bonaparte's strongest passion, next to love of power and thirst for glory, was to reorganize the nation. Of a temper fundamentally despotic, he believed that he could reconstitute the state and cause it to return to the tradition of the only stable society which he knew anything about—a centralized and kingly government. M. Vandal acutely observes: "Napoleon had a republican imagination, but the monarchical instinct."

Those two elements have been mixed in many rulers, before and since. They have been active in varied political movements. An ardent desire for liberty and equality and free opportunity on the one hand, and a strong sense of order on the other, an impatient determination to regulate everything and to control everybody—these two principles seem often to struggle for mastery in men and nations. Attempts have been made to reconcile them, to cause them to work together harmoniously. This was the idea of the founders of Massachusetts, if we may credit the motto of their State. They sought *placidam quietem*, but they wished it to be *sub libertate*. In general, however, public policy lurches to one extreme or the other. We will have an era of intense individualism, but it is followed by a period of excessive collectivism. It is upon the latter that nearly the whole world seems now to have entered.

To the inherent nature of it no man should be blind. It allies itself with what M. Vandal calls the monarchical instinct. The royal conception of government is that of a felt presence in the daily life of every citizen, directing his activities, controlling his business, regulating his income, his expenditures, his manner of life; prescribing the limitations of his personal enterprise, taking from him the education of his children, telling him what he shall buy, what he shall eat and drink and wear, inspecting and certifying all that is his. This monarchical ideal has been clearly defined by writers on government from Aristotle down. It postulates a government agent standing at the side of every citizen to see to it that he behaves. In its restricting tendency, it is the direct opposite of the republican dream of unfettered expansion for all men.

There is no excuse for making any mistake about the classification of the political ideas which are now in the ascendant. The mania for regulating everything does not spring from a democratic root. It goes with the notion of minute control from above which is characteristically monarchical. The "manners of liberty," to use the phrase of Lemaître, know nothing of this impulse to constrict and hamper private initiative. Nor do they of the feeling that there must be no friction in the social and political world; that all must run smoothly; that the striving and experiments, and even the mistakes, of men acting freely under a free government are evils to be suppressed. We are not now saying that the ends aimed at by the universal regulators are not good. It may be that we all ought to be cut after one pattern, and that State-activity ought to be indefinitely multiplied. Only, we ought to leave ourselves in no doubt whence all this comes and whither it will go if unchecked.

If curious people were to look about the world to-day in search of men in high authority who have, with Napoleon, a republican imagination but the instinct of a monarch, examples would not be wanting. It is quite possible to be avid of popularity; to be a master of self-advertising; to play upon the hopes and fears, the credulity and the vanity, of millions; to set immense forces at work in the masses; and then to call one's self a democrat because one can make use of democratic forms and win the applause of the multitude. Still, facts remain facts, and logic is logic. To make the ruler's own will the standard, not only of law, but of right and wrong; to pose as the Little Father of the people; to hold a "bed of justice," like Louis XIV., and settle all disputes and apportion praise and blame, punishment and reward, out of abundant and infallible wisdom—all that is to conform to the kingly model, and to act on the monarchical instinct, whether one be called President or not.

Hope lies, however, in getting rid of the personal equation in all these matters. Outstanding personalities, with demonic energy, often disturb a normal political development. If it is ever to be possible to reconcile liberty absolutely with order, to cause the republican imagination to blend perfectly with the monarchical instinct, the process must come about through the large and free expression of the people's will. No dictator, conscious or unavowed, can do it successfully. That would mean that an individual's temporary whim could be made permanent law. But one can easily conceive of an alert and sensitive public opinion, working steadily through its representatives towards the enactment of laws which would continually express the best moral and humane sentiment of the day, and to which all would gladly submit because they had not been im-

posed from above, but worked out from below in the fair debates and the deliberate choices of a free people.

AFTER KOREA—CHINA?

It is hard to believe that so discreet an official as the foreign minister of so diplomatic a nation as the Japanese should have really made use of the uncalled-for and almost brutal threats against the Chinese Government, with which a Seul dispatch credits him. In the absence, however, of testimony to the contrary, Viscount Hayashi is on record as declaring that "the fate of Korea may be regarded by China as a lesson; it should be a warning to that country to put her house in order, ere some strong nation, whichever one might be moved so to do, imitates events in Seul. China's despotism, which is the worst form of government, must yet reach a crisis, as, when the present ruling mind is gone, the state will fall a prey to intrigues." Hard words like these ring especially unkind when we think of the zeal with which China is now engaged in the very task of putting her house in order.

Though the Empire is incapable, so far, of self-defence, it has made fair progress towards the creation of a standing army, and at the present day can count on some 100,000 well-drilled troops under the efficient control of Yuan-shih-Kai, viceroy of Chi-li. The old education has been abandoned in favor of modern learning, and the establishment of new schools is actively carried on. A strong upheaval of national feeling is making itself manifest in the popular demand, to which the Government has lent a willing ear, for the retention of railway and mining concessions in Chinese hands. This new national spirit finds expression in the columns of a rapidly growing native press, which, edited for the most part by young students from Japan, is never weary of proclaiming the Empire's self-sufficiency. Finally, there is the great anti-opium crusade, which is intended to strike at one of the roots of the country's misfortunes by freeing her ultimately from the curse of an enervated and corrupt mandarinate and a lethargic population.

Upon the basis of such signs of a China not only awakened but rejuvenated and Europeanized, most of the authorities agree in predicting wondrous things to come within a wondrously short time, each emphasizing that particular force now at work which seems to promise most for the future. Thus Mr. Putnam-Weale, who has written a large number of stout and well-informed volumes on the Far East, puts his trust mainly in the new army. Within twenty years he expects China to possess a modern standing force from half a million to three-quarters of a million strong, and equipped with arms and ammunition from the great Government factories at Han-kow. Others base their predictions on the new nationalism as especially revealed in an enlightened policy towards the construction of railways. To Noël Péri, writing in the *Revue de Paris*, the most significant fact is the progress made in the new education. There are now, he states, some 15,000 Chinese youths pursuing their studies in foreign lands, of whom 13,000 are at the Japanese universities, high schools, and technological institutions. As the average period of sojourn abroad is about two years, this means that some six or seven thousand students leave and return to China annually. The fact that about half of the travelling scholars are maintained at the expense of the central or the provincial authorities is cited as conclusive evidence of the sincerity of the Government in its attitude towards the new learning. In other words, like the anti-opium edict, and unlike most Imperial enactments in China, the comprehensive school regulations, issued in January, 1904, minutely reconstructing the educational system of the Empire, have not become a dead letter. On the contrary, their influence has stimulated private benevolence for educational purposes to an extraordinary degree. Almost everybody is warm with enthusiasm. "With the exception of a few Manchus, every one in China is a reformer," and native scholars are proclaiming that China is no longer old, that she is the youngest of the nations, "young, strong, and beautiful."

Let it be said at once that all these predictions of China repeating the example of Japan within as short a time, appear, after the first flush of enthusiasm, altogether too optimistic. It does not follow that, because the Viceroy of Chi-li has succeeded in creating an efficient army of 100,000 men, the same rate of progress will be maintained by other men than Yuan-shih-Kai and elsewhere than in Chi-li. It will take more than two decades to transform the ideals of a nation that has been bred for thousands of years in the domestic and non-aggressive virtues. It will take decades before the Chinese learn to build and manage their own railways. And it will take very many years before education has spread among the lower strata of the nation. Schools have been rapidly built in Chi-li, but the school attendance in the province is still less than 100,000 for a population of 20,000,000. New brooms are sweeping, and there are clouds of dust in the air, but the house that is to be put into order is so vast that only credulous hope can see it assuming within a generation the spick and span order of its neighbor across the way. We need only consider Russia's painful struggles towards complete occidentalism to realize how slowly the change must come in China.

What renders progress all the more difficult is the absence of a strong central government. The historic Chinese governmental policy has consisted in maintaining an equilibrium among the various provinces, with the least arrogation of power to the Government at Peking. In all Oriental empires the instinct for local self-government has been strong, and there is no great difference between the eighteen provinces and the loosely articulated satrapies of ancient Persia. To expect from the dynasty at Peking complete responsibility, such as modern states in their dealings assume to vest in their own sovereigns, is manifestly unfair; and to threaten Peking, as Viscount Hayashi has done, in the face of its late good behavior, is unjust. No one nation, of course, can step in and assume the mastery of the Empire, because the task is too big. The play of international politics will keep China intact for a long time to come, while she works out her destiny, not through her army, which will always be inferior to Europe's armed forces, but through her schools. The Powers should be content to let the Celestial Empire pursue a peaceful development.

A FEDERATED SOUTH AFRICA.

From the moment when peace was signed with the Boers at Vereeniging in 1902, the union of Africa south of the Limpopo and Orange Rivers under one autonomous government might have been taken for granted. It was only a question of time. The British trend towards colonial federation, which had manifested itself in North America and Australia under the sole influence of internal causes, could not but run with greater force in South Africa, where was to be found the additional powerful stimulus of neighboring foreign territories and, consequently, foreign rivalry. The problem of federation could not, of course, enter the field of practical discussion so long as uncertainty existed about the conditions that would result from the establishment of self-government in the subjugated Boer republics. Now that events in the Transvaal have established clearly that the former subjects of Presidents Kruger and Steyn have made up their minds to recognize the accomplished fact in South Africa, the way has been made plain to intercolonial union. The ideal cherished by Cecil Rhodes is warmly advocated by Premier Louis Botha.

At the request of the Cape Colony Government, Lord Selborne, High Commissioner for South Africa, has recently published a memorandum which is an uncompromising plea for colonial federation. Lord Selborne sums up the situation by declaring that, whereas the people of the various South African colonies are as completely self-governing "as any free people in the world," the

people of South Africa, integrally considered, enjoy no rights of self-government, for the very striking reason that they have "no South African Government with which to govern." The High Commissioner, who at present is charged with correlating and harmonizing the four different policies of Cape Colony, Natal, Orange River Colony, and the Transvaal, is responsible only to the British Colonial Secretary, and ultimately to the Imperial Parliament. He is not an independent authority; and taking, as he does, his orders from England, it is inevitable that the interests of South Africa should suffer either through lack of knowledge or possible lack of sympathy on the part of the home Government. Lord Selborne may here be thinking of the Chinese labor question and of the attitude of the British Cabinet towards anti-Asiatic, that is, anti-Indian legislation.

When we come down to details, we find conditions very similar to those which preceded Australian, Canadian, and even American unity. The colonies are quarrelling among themselves over their railway and customs arrangements, and are pursuing no settled policy in the all-important matter of legislation for the natives and the recruitment of native labor for the Transvaal mines. It is the Rand that constitutes the most potent unifying force in South Africa, since about it centre also the railway and the native labor questions; and it is an admitted fact that the prosperity of South Africa is very largely bound up with that of the Transvaal mines. Hence the bitter protests in Cape Colony and Natal against the railway policy of the Transvaal Government, which has greatly favored the foreign port of Lourenzo Marquez, on Portuguese Delagoa Bay, over the Cape harbors and Durban. On the other hand, the Transvaal has really been compelled to grant large concessions to Delagoa Bay in return for permission to gather native laborers for the mines in Portuguese territory, whither it has been driven by the vexatious regulations of its fellow-British colonies. In the matter of tariffs, though some sort of customs union is now in force, the arrangement is characterized as "a mere temporary compromise of local interests not based on any intelligible policy." Finally, the necessity of formulating a uniform policy that shall define the position of the white population of nearly 1,100,000, in face of almost four times as many natives, is extremely pressing. It was a factor which the American, Canadian, and Australian commonwealths did not at first have seriously to consider.

General Imperial considerations would naturally incline the British Government to favor the federation movement. From the Liberal point of view, it is only giving to the Afrikanders their just rights of self-government. To this the Tory might add, as the London *Times* argues, that the formation of another British Commonwealth must tend to further the cause of Imperial reconstruction, for which, it sadly admits the time is not yet ripe, as the last Imperial Conference showed. But there are also special reasons applicable to South Africa. With Germany taking up her colonial burdens in a spirit of renewed determination, with great changes impending in the Congo, it is eminently desirable that the people of British South Africa should allow no advantage to possible rivals by pursuing dissentient policies.

A second advantage would be the closer reconciliation between Briton and Boer, which common participation in the upbuilding of a new commonwealth would undoubtedly bring about. A federal union could not favor one race above the other. The balance between the two is so evenly adjusted as to make the permanent preponderance of either impossible. In Cape Colony, for instance, the English Progressives are in power by a slender majority, but, on the other hand, the Boer majority in the Transvaal, closely analyzed, is not very strong. English Natal would counterbalance Dutch Orange River Colony. In other words, there is no reason why South African unity should not prove as effective a peacemaker between English and Dutch as Canadian unity has been between English and French.

The only feature to which the British Government may look forward with uneasiness is the complications that will result from a vigorous anti-Asiatic policy, such as a young South African federal Government is very likely to assume. As things are, the Imperial Government is hard put to it in exacting from her African colonies some measure of kind treatment for her Indian wards. It has been compelled recently to give its consent to a stringent Transvaal Colored Registration bill, aimed against Hindu immigrants. Natal is historically hostile to Asiatics. With Australia unceasingly active in baiting the Japanese, and Canada growing plainly hostile to them, Britain must look forward to a rather difficult time in keeping her mischievous young commonwealths from annoying her colored subjects and allies.

GROWING FLIPPANCY OF THE AGED.

There was lately printed for private circulation the "Letters with Biographical Notes" of the first Sir James Stephen. He was the father of the better-known Leslie and Fitz James Stephen. An intimate friend of Macaulay, Carlyle, Hallam, Thirlwall, and other early Victorian writers, Stephen left many original and piquant notes concerning them. His phrase about Macaulay's conversation, but echoing the comment of many, was, "Tom talked like a cataract." Sir James, in fact, was often disappointed in the celebrities he met. 'Authors and preachers,' he once jotted down, 'ought to be locked up like the Grand Lama." But we have been particularly struck by his remark about a certain breakfast, at which many of his most famous friends were present. At it, he said, the conversation was not enjoyable, because it was "too careless, thoughtless and light for men mostly above fifty."

Such a complaint would scarcely be conceivable nowadays. Years have long since ceased to bring the philosophic mind, in the sense of making those who carry them talk like a philosopher. Serious conversation is, rather, the mark of the young. One reason why crabbed age and youth cannot live together is that youth, of a certain sort, is apt to be depressingly solemn, while for true vivacity, jollity, and general devil-may-care, you have to go to men with whitening hair, or no hair at all. One of the characteristics of our age is that people refuse to grow old, whether gracefully or in any other way. There are no more old ladies, as was pointed out by a writer in the *Atlantic's* "Contributors' Club," not long ago. In their room, we have dashing grandmothers whom their delighted granddaughters vote to be "regular bricks." And if you ask who it is, at club or social gathering, that sets the table in a roar with his quips and wiles, ten to one you will find that it is some jolly, rubicund gentleman of sixty-five, or so, with a gray beard, who ought, according to the standards of a hundred years ago, to be looking out dismally on the world, and thinking dolefully of his own latter end.

Age is, after all, largely a matter of definition. Everything depends upon the conventions which rule at the moment. Men are as old as they are taught to think they are. It has been shown, we believe, that Shakespeare's "Old John of Gaunt, time-honored Lancaster," was about forty-six years of age. At that time of life, men are now winning golf-tournaments and making centuries at cricket. On the other hand, there have always been men who defied the flight of years, even in those pre-Osler days when it was supposed that fifty meant gravity and dulness. Dr. Johnson was one of these indomitable old men. When he put his head out of the window, at the sound of the roisterers below, at two o'clock in the morning, and said, "Are you there, boys?" after which he went out to finish the night with them, he was, if we remember aright, sixty-two.

Our growing numbers of sprightly old men, who "jest with all ease," in a way that Sir James Stephen would have thought most unfitting, and maintain a

smiling, if wrinkled, front to the world, are probably due, in part, to what we may call the general retardation of life in our time. Men get out of the colleges and into the professions later than they used to do; they are farther on in years before they get on their feet in business; they marry later; hence it is not strange that they retire later. Slower in arriving on the scene, they naturally desire to linger there. If Gladstone, like Pitt, had been Prime Minister of England at twenty-four, he probably would not have insisted upon being so at eighty-five. "Youth will be served." But so will age, when you make it wait a long while.

What is changing most radically, however, is the tradition, not about years merely, but about puffed-up solemnity and an oracular pose at any age. If our youthful old men are often highly jocose and given to "light" conversation, it is partly because the world in general has come to laugh at the portentous man, whatever his years may be. Truth may be conveyed, and the lessons of experience enforced, by a man *quamquam ridentem*. This discovery has greatly eased off social manners. It is no longer necessary for a venerable Sir Oracle to call upon the company to mark his words while he shows them just in what ways the world is going to the devil. Whatever wisdom he has to impart, we have now learned, can be better insinuated by humor than hammered in by formal logic. The light touch, the playful wit, we have really found to be effective instruments of persuasion. Our best writers and speakers seek after them, and it is not strange if the aged like to arm themselves therewith. Let us not call our light-hearted old men flippant; rather, let us admire their debonair spirit, and confess that they add much to the world's enjoyment by facing its ills and blessings alike with a merry face. A joyful countenance, in old age as well as youth, doeth good like medicine; and we must not forget that with it may go as deep a philosophy of life, as true an appreciation of the mysteries of this unintelligible world, as could possibly be cherished underneath a sour and forbidding exterior.

BOOKS ON THE FRENCH REVOLUTION.

PARIS, July 18.

Of the making of books on the French Revolution there is no end, nor is there likely to be, until every least scrap of paper of the time has been duly scrutinized and printed. The result is not confusion, as the enemies of documentary history might suppose. All these private letters, court records, account books, diaries, and even the memories noted down or caught orally in later years, open windows on the inmost thoughts and feelings of men during the great upheaval. Taine, in one of his letters just published, insists on this "psychology" of French Revolutionists as the only key to the history which they made and are still making.

"Lendemains révolutionnaires," by Eugène Welvert, follows up the fate of the "regicides"—those members of the Convention who, for varying reasons, took it on themselves to vote the death of the King. All English readers know the pages in which Macaulay sought to fasten one of them—Barère—to a gibbet, from which no future historian could take him down. This latest writer is scarcely more tender, noting that, until his death in 1841, Barère spoke of the Terror "as of the simplest and most innocent thing in the world." Many of the regicides themselves perished under the guillotine. When Napoleon came to restore order, 369 were still living; more than a hundred of these withdrew into private life. This is a slight, but material addition to Taine's otherwise accurate statistics of the great number who took service under the Emperor, obeying all their life that same feeling of fear which had made them vote the death of the King. Most of those who survived went into exile when the Bourbons returned and seventy-two died there; after the next revolution, in 1830, there were forty-four still left to return to their country. The astounding vitality of these men of the Revolution went along with extraordinary longevity; sixty of the regicides died past eighty, and twelve past ninety. From new unpublished documents M. Welvert has traced in detail the existence of the more interesting among them. An example is the father of Philarète Chasles, who already appeared in his son's Memoirs as dying in 1826 in the utmost obscurity—"at odds with wife and children, with brothers and cousins, with heaven and earth." The judgment on Carnot is, perhaps, final—"without calculation or intrigue, the dupe and victim of the impression, I would almost say of the emotion, of the moment. He was a soldier and, in his patriotic zeal, thought—doubtless in good faith—that he had political abilities." The emotion of the moment was in too many cases nothing but fear—a part of the epidemic *Grande Peur*—which was recognized by one of its victims, André Chenier, in his wonderful pages on "the altars of Fear." It is only now that impartial minds are beginning to see into this secret of actions so human, yet so unnatural to men of ordinary civilized emotions.

The memoirs of that most illustrious tight-rope dancer, Madame Saqui (1786-1866), begin with a vivid episode of this blood-stained period. The little girl, who started on her career at the age of five, was a witness of the vile massacre of Marie Antoinette's friend, the Princess de Lamballe, whom she forever after remembered to have heard crying to her executioners—"Tigers, kill me!" The slow, cruel lubricity of this inhuman deed, and the real character of the "patriots" involved in it, have been finally worked out from the records of the time by Dr. Cabanès in his "Névrose révolutionnaire"; they explain both the great Fear and the consequent Terror, with a criminology surer than Carlyle's Puritanism or Taine's psychology. Madame Saqui grew up to happier days and became in turn "*première funambule* of His Majesty the Emperor and King (Napoleon)" and "*première aerobate* of His Majesty the King (Louis XVIII.)." She still danced under Louis Philippe and appeared for the last time, at the age of seventy-seven, for the Third Napoleon.

The new number in the series, edited by G. Lenotre—Mémoires et Souvenirs sur la Révolution et l'Empire—concerns the imprisonment and exile of the daughter of Louis XVI. She has been somewhat neglected in history as during life, perhaps by comparison with the tragedy of her brother's fate. The present book goes from the actual prison of the Temple to her virtual prison in Vienna, where she was the pawn of anti-Revolutionary politics, unable to find a common basis of action. Another volume reminiscent of the Bourbons is the life of the Countess, Louise d'Esparbès, by the Vicomte de Reiset. Her liaison for a lifetime with the future Charles X. left him after her death turned to the narrowest piety, and was in a way responsible for the Ordonnances that brought on the Revolution of 1830 and made the restored Bourbons forever impossibie.

A once famous *cause célèbre* of this royal line is presented in all its details to the detective ability of modern readers in the new volume of the Enigmas of History—"Philippe Egalité et Monsieur Chiappini, histoire d'une substitution"—by Maurice Vitrac of the Bibliothèque Nationale, editor of the series. The issue involved Louis Philippe vitally; and Maria Stella persevered to her death in saying, especially to English friends, that she was the true child, while the other was only a substitute for inheritance sake; if not, whose child was she?

A. Aulard, the professor subventioned by the Paris municipality, at the Sorbonne, apparently with the aim of permanently confuting Taine, just as Queen Elizabeth is credited with founding a chair at Oxford for the permanent confutation of Bellarmine, gives the second volume of "Les Orateurs de la Révolution—la Législative et la Convention." The professor has also written a preface for the popular pamphlet, "La Révolution française et ses détracteurs d'aujourd'hui," by Léopold Lacour; this has a certain importance, as it belongs to the effort made to stem the tide of French thought turning away from the Revolution, to the dismay of its disciples who still govern the country.

"Souvenirs de ma vie militaire (1792-1822)," by Commandant Vivien, is a soldier's account of thirty years of his career, beginning with the final triumph of the Revolution and the uprising of France against all Europe and prolonged through the entire Empire down to the Restoration in its apparently successful years. Kellermann, a soldier of equal career, always said: "The infantry of the King's army made the Revolution."

A real find in history in the making is the "Cahier rouge"—pages which have always been missing from the valuable diaries of Benjamin Constant. They have been edited by a member of the family and give one of his journeys in England. This impecunious Swiss Protestant, educated in Germany and Scotland, became the chief theorist of "Liberalism" in France during and after the Revolution. Here we can see his ideas under formation and can already distinguish the variations which have led so far asunder the conceptions

of liberty in democratic England and America and in republican France. To this day it is Benjamin Constant and not Tocqueville who defines liberty for the most moderate French republicans.

"L'Avènement de Bonaparte," by Albert Vandal of the French Academy, comes to an end with the second volume on the Consular Republic. Even those who stick closest to their Revolutionary guns and regret still the coming of Napoleon unite to praise the conscientious labor and impartiality of this historian. He has now completed this one period, wherein order arose from political chaos. S. D.

Correspondence.

VERROCCHIO.

To the Editor of The Nation:

Sir: Nothing to me improbable inheres in the theory that Verrochio owes a great deal to his most famous pupil; but to hint, as Mr. F. J. Mather, jr., does in the Nation of July 4, that Verrocchio owes more to Leonardo than Leonardo to Verrocchio, seems to me a critical extravagance which will tend to a very dangerous heresy, indeed—the theory, a not uncommon one, that Verrocchio is in some way an inferior artist. Your correspondent's statement of the general historical probabilities for the view of Verrocchio's pictorial activity as that of *entrepreneur* and designer, rather than executant, is so admirable that I wonder at what seems like an inadvertence in the larger issue of the fundamental relation between master and pupil. For nothing seems more significant in this relationship than the contribution of the master. Think Leonardo away as artist, and we lose, indeed, some of the most dramatic and ecstatic moments of Renaissance, or any, art. Think Verrocchio away, and we lose a member of the actual body of art, and leave it mutilated and incomplete. At the risk of more than heresy, of æsthetic blasphemy, indeed, and, lover of Leonardo as I am, I must say that Verrocchio is indispensable, and Leonardo, comparatively, is not; that Verrocchio, in the higher sense of the term, is the more classical and typical artist of the two.

It is not a question of personal *charisma*, but of æsthetic logic. It is a glorious thing to possess the phenomenal and exceptional essays of a universal genius in an art, but it is, in my opinion, for art and its constant and steady growth and use more important to possess perfect types of the normally active human capacity for beauty. Of such capacities Verrocchio is one of the best possible exemplars. Never reaching the extreme heights or depths of human experience, he moves serenely and potently in the mid-world of our common life, and limns for us its truth and poetry with no prophetic exaltation, indeed, but with unfailing virtue and sympathy. It is not a culminative and absolute art, but a cumulative essay. We do, or can, feel its general tonic inspiration, most of us; we accept its concrete imagery of actual conditions, and in the end, I think, we find it preëminently trustworthy and satisfactory.

Verrocchio in his sculpture, in his drawings, in the Baptism, and, as seen through his only gifted pupils, Leonardo and (seemingly) Fiorenzo di Lorenzo, in pictorial design generally is typically *integer—artis—scelerisque purus*. His thought may be a little archaic, a little cut and dried; but it is real thought, it is thoroughly and seriously premeditated; it is true design, and, given the artistic premises, the stylistic syllogism is of the utmost force and cogency. In craft, where pupils do not intervene, one feels the certainty, the wisdom, the masculine robustness, the rightness of everything rather than sheer beauty. But Verrocchio's truth is never literal or microscopic, and it possesses the sober beauty of its organic and constitutional being. Always a realist, no epic imagination, no lyric rhapsody, is possible to the artist, but only the dramatic interpretation of a concrete world—to the invisible he is blind. Yet it was precisely this grasp of the near and tangible, this visual sanity, which was needed to make the dreams of Leonardo objective, and to direct the volatile Umbrian imagination in Perugino and Raphael (through Fiorenzo, who is the chief stylistic link between Florentine and central Umbrian art*) to a rational means of expression. Pollajuolo was too extreme and too narrow a realist to serve for this practical synthesis, this workable unification of ideals, and the historical importance of Verrocchio is correspondingly clear. As to his influence upon Leonardo, which is the question at present under consideration, I may say that the Adoration of the Kings demonstrates this very concretely. I may be allowed to say how, in explicit terms.

Except for the landscape drawing of 1473 (not 1478, as in your correspondent's letter), and perhaps the little Annunciation of the Louvre, we have nothing of Leonardo's which exhibits an independent initiative before 1478, the date of a signed drawing and of some other drawings which are probably of about that time. And as the Annunciation of the Louvre is rather an academic working out to compositional perfection of its Uffizi prototype than a fresh invention or an inspired or especially important product of Leonardo's imagination—in my opinion at least—the Adoration of the Kings of about 1481 may be taken to be the first great extant monumental example of the wizard of the Renaissance. And it is certainly one of the masterpieces. Leonardo's ambition is here wholly artistic.

Now, an analysis of the Adoration exhibits every compositional element to be traditional, in the Domenico Veneziano-Baldovinetti-Verrocchio inheritance. The arboreal middle distance with which Leonardo begins—significantly as landscape painter—the execution in detail of his colossal picture, the thing which determines the tonal rhythm of the piece, is traditional. The near horizon of the foreground, bounding the chief figurative group, is traditional. It is simply a modification and naturalization of the conventional architectural screen or parapet of the Early Renaissance. The centralization of the action and the definitely simple construction of the main features of the composition on symmetrical lines—all this is not only traditional, but essentially conventional, and less modern than the scheme of Signorelli's Pan, which is of an earlier date. And in formal arrangement every other motive in Leonardo's design—the architecture and the episodes of the background and the distant landscape—is not new, but old. The amazing sense of modernity, the magnificent effect of life and freedom which make us instinctively hail the Adoration of the Kings as a fresh creation, a gift of art from Heaven itself, and to class it at once as one of the supreme if unachieved masterpieces, are not due to any formal revolution in art, but rather to the vivification of a traditional art body with the personal emotion of a free mind. Leonardo modifies a well-worn form to express a new thought—essentially here in my opinion a thought of the elemental and intangible envelope of atmosphere and the space suggestion as symbolic of his human theme. With Giotto and Masaccio he is especially a poet of the pictorial setting—the landscape—and it is in this that his work constitutes a new type and style. If we remove Leonardo's figurative foreground, his whole "historical" theme, from this work, the work still exists almost intact as to its significance and its visible body. Try the experiment and see.

The traditional character of this work is, in fact, its chief note as compared to Signorelli in the Pan, or to Giorgione in the Concert Champêtre. That Leonardo owes his objective robustness to Verrochio's influence, and that the severe training of his youth in accepted types of composition and design was necessary for his development, seem to me not only indisputable, but matters of æsthetic fact upon which we cannot too strongly insist. Whistler's dictum of the accidental character of art and the loose eclecticisms prevalent in modern art generally, which arise from such a quarter-truth, need such great historic instances for their refutation.

I think that the limitations of his pictorial ideal must have been recognized by Verrocchio, and that when Leonardo pointed out the holder and better way, nothing was more natural than that Verrocchio's catholic judgment should be the first to applaud and encourage his gifted pupil. At the time, however, say about 1473, when the Baptism must have been composed, Verrocchio was nearly forty years old. He had put his heart and soul into the noble design of the Baptism. It was and is, however, manifestly, considered as a whole, the art of a born sculptor, but of an indifferent painter. If, as the story goes, Verrocchio had eye enough to see that Leonardo's share of the background and execution was of a type of art into which his own magnificent but too definitely articulated and elaborated plastic forms did not fit, it is easy to understand that he never cared to paint more. If he was piqued, as Vasari says, it would be only human. That he was man enough to be unresentful, is proved by Leonardo's living with his master for

*It is impossible, with the picture at Fenway Court, the Madonna at Berlin of 1481, and a fragment at Nantes in mind, not to believe that Fiorenzo must have actually worked in Verrocchio's atelier. Perugino is clearly a pupil of Fiorenzo, and it seems possible to me that Vasari confused the two masters, both of Perugia, for want of information as to the earlier one. The attribution of this type of work to Fiorenzo is based upon tradition. It is obviously intermediate between Verrocchio and Perugino, and by some master to whom Perugino owes very important elements of his style—as his early draughtsmanship and his type of landscape. The important fragment at Nantes is published in the *Rassegna d'Arte*, by F. M. Perkins.

some years after the latest date which it is possible to give to the Baptism.

Everything seems to favor the theory that, although Verrocchio accepted commissions for painting and competed for public works in the art, he actually executed in color little or nothing of importance. He was paid for the Pistoia altarpiece; but it is admittedly painted by Di Credi, in large part. In my opinion the execution of the picture in color is entirely Di Credi's. And I know not of a square inch of *painting* which is accepted by a consensus of criticism as Verrocchio's.

And yet, through the influence of his designs alone, and the existence of the Baptism and of certain universally accepted, although unauthenticated, drawings, and by the vision of his sculpture, I venture to think that no other personality in Italian art than Verrocchio's is more definitely present to us as we name his name. If we, some of us, give his reputed paintings to Leonardo—eliminating secondary artists like Botticini and Di Credi—it does not rob, but rather crowns Verrocchio's personality. If we also think of Fiorenzo di Lorenzo in the beautiful picture at Fenway Court, as an Umbrian scholar or at least learner, who transmits the solid science of Florence to Perugia, and thus contributes to the education of the Urbinate, the honor of Verrocchio might even be confined to these his followers and yet be of the highest. If the master learned from the chief scholar, as I believe that he did, it is but one rare honor more. But he taught that scholar first, and taught him the foundation of all art, which is truth. It is not one of the least merits of Maud Cruttwell's book on Verrocchio that she reads Verrocchio's title clear as a teacher, and this issue is more important than any disputed authorship.

WILLIAM RANKIN.

Richmond, Mass., July 9.

THE IRISH COUNCILS BILL.

TO THE EDITOR OF THE NATION:

SIR: Your note in the *Nation* of June 27 on the "delightful inconsequence" of the Irish Nationalists in deciding "to break off relations with the English Liberals" shows a misapprehension of the facts. There is no "new policy." The Irish party remain, as before, independent of both the great English parties. In the interest of Irish Catholics in England they opposed the Liberal Education bill of last session, and during the debates on that their relations with the Liberals were just as much broken as now. After that profuse promises and intimations were made to them of financial, administrative, and educational reform to be carried out this session. Many promises impair confidence, and, as the session passed, it became evident that these would result in no action. A Prime Minister is not omnipotent, and personally there can be no doubt of the honesty of Campbell-Bannerman, but it is well known that five of the eighteen members of the British Cabinet refused to agree to such extensions of the Irish Council bill as would have made it possible for the Nationalists to accept it.

Campbell-Bannerman had to choose between parting with these five members, and so breaking up his Government, or offering a measure which had a semblance of carrying out Liberal promises, but which was almost certain to be rejected. His Government has a mandate to carry out certain British reforms, and cannot be expected to destroy itself for the sake of Ireland.

Owing to the conservative element in the Cabinet, and the archaic and dilatory procedure of Parliament, this Government, with an enormous majority, is unable to pass even British measures, is proving itself so powerless that not only Irish but many Radicals and Labor members are despairing of its competency to effect universally demanded reforms.

The rejected Irish Council bill has been generally misrepresented by the English press. There was to be a council with a sufficient number of members nominated by the British Government to turn the scale against the elected members. If this was not enough to secure anti-popular administration, the lord-lieutenant could annul any proposal of the council.

The function of the council was to pay away four out of the eleven millions sterling of Irish raised revenue; not to spend them, for the allocation of these four millions was practically settled by the existing laws, and very little discretion was vested in the council as to the expenditure. There was no room for economy, but much need for a larger expenditure on the services to which these four millions were allocated. The council had no control over those services in which economy is needed and is possible, the police, the judiciary, the civil service generally.

In view of the additional expenditure which the council would have to undertake, and in face of the report of the Financial Relations Commission (accepted as correct by the Liberal Government) that Ireland is overtaxed by not less than three millions sterling a year, the bill proposed to allocate £600,000 to the new council for certain definite purposes.

Such a council would soon have become discredited with the people, for its restricted powers would have made it impotent for administrative reform. It would have been difficult to get capable men to accept membership of such an emasculated body. It would not have relieved the British Parliament of the time now spent on Irish questions, or attempted legislation, and it would not have set Irish members of Parliament free from the necessity of attendance at Westminster.

The revenue raised in Ireland is between eleven and twelve millions sterling, and owing to the circumstances of the country this taxation, mainly indirect, falls more heavily on the poorer classes in Ireland than in England. The Irish pay, but the British Parliament decides how the revenue is to be spent.

Does it not appear reasonable, as often proposed by Irishmen, that, after a fixed contribution to any Imperial services that are beneficial to Ireland, the balance of revenue should be spent and administered by Irishmen as the Irish people think best, instead of being, as generally admitted, misspent by persons ignorant and careless of the wants and wishes of Ireland.

The Irish revenue having been raked into the British exchequer, most Englishmen think that all Irish expenditure voted by Parliament is a spending of British money on a discontented and ungrateful people. What the Irish party have consistently asked for is that Ireland alone should determine how the Irish revenue should be spent. The rejected Council bill gave no such power, and was condemned beforehand in Campbell-Bannerman's own words. "I defy," he said, "the wit of man to give Irishmen any control, any effective voice, any management of their own affairs, unless there is an executive responsible to a body in which the elective element shall have a decisive voice."

AN IRISHMAN.

Dublin, July 8.

[The concluding citation from Campbell-Bannerman gives point to our original comment. Is it not "inconsequent" for a Home Rule party to break off relations with a Prime Minister who expresses such deep agreement with it, in order to work for Mr. Balfour, who has said that under no circumstances would he consider the possibility of Home Rule for Ireland? On the composition of the proposed Irish Council, we merely remark that Mr. Birrell's bill provided for 24 nominated members, but 82 elected members.—ED. NATION.]

SEPARATE CARS.

TO THE EDITOR OF THE NATION:

SIR: The career of the *Nation* has been marked, in the main, by fairness towards the Southern people in discussing the race problems, which, for more than forty years, have vexed the souls of the wisest and the best all over the Union. To the Northern man, that question is, largely, one of abstract right, but the Southerner is confronted daily with it practically, and in the concrete, in every imaginable shape. Now, in the *Nation* of July 11, in an editorial on a decision of the Interstate Commerce Commission upholding the "Jim Crow" car law, you say: "As men of intelligence, they [the interstate commerce commissioners] know perfectly well that nowhere in the South are the 'Jim Crow' accommodations equal to those given to the whites, either in cleanliness or sufficiency."

The writer cannot speak from personal knowledge of other Southern States, but, as a citizen of Texas for thirty-five years, he can confidently assert that you are in error as to Texas, and, upon information and belief, as to the South generally. The "Separate Coach" law was enacted in Texas in 1891, and provides that the "separate coaches shall be equal in all points of comfort and convenience." (R. S. of Texas, Art. 4,509.)

It is not uncommon for a white passenger, not observing the sign on the car "For Negroes," to take a seat in the coach set apart for them, there being nothing to indicate the difference between the coaches for the two races in the conveniences or the comforts of the car, and to retain the seat until the conductor or porter reminds him of his mistaken location. The writer, whose profession as a lawyer requires more or less travelling, has several times made that mistake, and has never observed any difference between the coaches for the two races, in point of comfort and convenience. If any rail-

way company should discriminate, it cannot be doubted that the Texas Railroad Commission in the case of an intrastate traveller, and the Interstate Commerce Commission in the case of an interstate traveller, would promptly correct the wrong. The writer has never heard of any complaint by negroes, in Texas, that their coaches were not equal to those for the white race, "in all points of comfort and convenience." Non-compliance with the Texas law makes a railroad company liable to a penalty, in a suit by the State, of not less than $100, nor more than $1,000, "for each and every such failure." (R. S. of Tex., Art. 4512.) No one who knows the Railroad Commission of Texas, and the Texas people, will doubt either that the commission would be prompt to vindicate any violation of this law by the railways, or that juries would speedily return so many verdicts against the offending roads that disregard of the law would be extravagant folly.

The writer has not examined the laws of other Southern States, and, not being an editor, does not know them ex-officio, but it was asserted by Senator after Senator from sundry Southern States, during the last session of Congress, that like laws prevailed in their States, and that the coaches for each race were alike in point of comfort and convenience. If anywhere there is inequality in these respects, good men everywhere will rejoice to see the evil corrected, for it is not less the law than it is a principle of natural right, that for the same charge equal accommodations should be furnished to all.

Passing from your proposition that "nowhere in the South are the 'Jim Crow' accommodations equal to those given to the whites," may I add a word on the general subject of "separate coaches" for the white and black races? The origin of the separate coach laws in the various Southern States is believed to be substantially alike in them all. From the close of the civil war until 1890 in Louisiana, until 1891 in Texas, and until within the past seven or eight years in Virginia, the white and colored people were carried in the same coaches. It was found, from this experience of many years, that the commingling of these two races was the frequent occasion of breaches of the peace, and not seldom of murder. The fault was sometimes with one race and sometimes with the other. As a police measure, in order to preserve the public peace, the various Southern States believed that reason and the experience of many years demonstrated it to be the exercise of a discriminating and sound judgment to separate the races on railway cars. Hence the separate coach laws. The writer believes there are few people who, remembering the results of commingling the races, do not applaud these laws.

As to whether the separate coach law is an outrage upon the colored people, the writer is content to close this communication with a quotation from the opinion of Justice Brown, delivering the opinion of the Supreme Court of the United States in the case of Plessy vs. Ferguson, 163 U. S., page 551, upholding the validity of the Separate Coach law of Louisiana, enacted in 1890:

> We consider the underlying fallacy of the plaintiff's argument to consist in the assumption that the enforced separation of the two races stamps the colored race with a badge of inferiority. If this be so, it is not by reason of any thing found in the act, but solely because the colored race chooses to put that construction upon it. The argument necessarily assumes that if, as has been more than once the case, and is not unlikely to be so again, the colored race should become the dominant power in the State Legislature, and should enact a law in precisely similar terms, it would thereby relegate the white race to an inferior position. We imagine that the white race, at least, would not acquiesce in this assumption. The argument also assumes that social prejudices may be overcome by legislation, and that equal rights cannot be secured to the negro except by an enforced commingling of the two races. We cannot accept this proposition. If the two races are to meet upon terms of social equality, it must be the result of natural affinities, a mutual appreciation of each other's merits and a voluntary consent of individuals.

F. D. Minor.

Beaumont, Tex., July 22.

[We are glad to have so favorable a report from Texas, but know no reason to modify our statements as to "Jim Crow" accommodations elsewhere.—Ed. Nation.]

Notes.

The life of "William Thomas Arnold," by Mrs. Humphry Ward and C. E. Montague, reviewed in the *Nation* July 18, is now added to the regular importations of Harper & Bros.

Sir George Trevelyan has completed the third part of his history of "The American Revolution," and it will be issued early in the autumn by Longmans, Green & Co.

John Murray has in press a verse translation of "Virgil's Messianic Eclogue," with essays by Joseph B. Mayor, Warde Fowler, and R. S. Conway.

G. P. Putnam's Sons will soon have ready a book on "The Salon," by Miss Helen Clergue, which is said to give an intimate picture of Mme. Du Deffand, Mme. Geoffrin, Mme. d'Épinay, and Julie de Lespinasse. The same house is about to issue the second volume of Prior's Works in the Cambridge English Classics.

Paul Elder & Co. announce a new series, the Abbey Classics, each volume of which will contain a famous poem. The first group will be Burns's "Cotter's Saturday Night," Milton's "Ode on the Nativity," Lowell's "Vision of Sir Launfal," and Longfellow's "Building of the Ship." Another series of Western Classics will be devoted to "gems from the literature of the Pacific Coast."

To their Handy Volume Classics Thomas Y. Crowell & Co. have added "Best American Tales," edited by Trent and Henneman; Thoreau's "Cape Cod"; "Little Flowers of St. Francis of Assisi"; "Meditations of Marcus Aurelius"; Drummond's "Natural Law in the Spiritual World"; and Browne's "Religio Medici." The series now includes 183 volumes.

Prof. Max Th. W. F. Förster has taken the editorship of the "Shakespeare Jahrbuch," in place of Professor Keller, resigned.

At his death J. K. Huysmans left the completed manuscripts of three volumes dealing with three of the old churches of Paris. They will be published this autumn.

In the "Jahrbuch der Bücherpreise," bearbeitet von C. Beck (Leipzig: Harrassowitz), continental Europe has at last found a counterpart of the English and American "Book Prices Current." The first volume, for the year 1906, covers not more than thirty-two auctions, chiefly in Germany and Paris, with a few from Holland, with altogether 3,901 titles. The arrangement is alphabetical; as a rule, no book has been included that did not fetch ten marks; lots of miscellaneous contents have been omitted. The most important article is Luther, with 863 titles, carefully edited with references to the Weimar edition of his works, as well as to standard bibliographies. The next largest article is Goethe, with 100 titles. Further, Erasmus, forty-two titles; Melanchthon, thirty-nine titles; Lessing and Schiller, thirty titles each. There are a few Americana, six of the Usselinx books, three by Las Casas, etc.

James Duff Brown's "Manual of Practical Bibliography" (London: Routledge) fills a real gap. Since Horne's "Introduction to the Study of Bibliography" (1814) no authoritative treatise on the subject has appeared in English, and few in other languages. Mr. Brown treats with authority, as well as with common sense, such topics as Title Pages and Colophons; Place of Publication; Dates and Chronograms; Pagination, Signatures, Sizes, Collation, etc. The chapter on Compilation of Bibliographies and Catalogues as also the Rules and Examples for Book Description and for the Compilation of Bibliographies are especially a valuable discussion of the principles that underlie the scientific description of books. The introduction is written with force and conviction, although it would have carried conviction better if it had not been disfigured by the many and at times savage onslaughts on those who represent other points of view than his own. In a new edition, the list of names of cities might well give place for amplification of the glossary of terms, a most useful and much needed feature of the work. The chapter on Guides and Aids to Books and their Description is suggestive enough to the beginner, though too many foreign bibliographies are conspicuous for their omission. The most serious defect in this chapter is the inclusion of a list of twenty-eight "Special Bibliographies" on twenty-two different subjects, neither the subjects nor the bibliographies being particularly significant even as examples.

The Biblia Pauperum, the famous manuscript mentioned by Lessing, but which had since been lost track of, has again been found in the Ducal Library in Wolfenbüttel, of which Lessing, in his day, was in charge. During the entire nineteenth century no trace of this manuscript could be found. This is explained by the German papers by the fact that it was bound in one volume with a manuscript of the "Speculum Humanæ Salvationis." The manuscript contains 38 pages and the same number of groups, among the latter four not found anywhere else. It is finely illustrated, especially with pictures from the Old Testament. It was rediscovered by Dr. J. Lutz of Illzach.

We note the completion of two works to which, during the course of their publica-

tion, we have from time to time called attention. The first is the supplement and index to the "Dictionnaire international des écrivains du monde latin," by Prof. Angelo de Gubernatis. The original work exceeded by some 500 pages the limit the editor had calculated, and this supplement contains nearly 200 pages more. Prof. de Gubernatis announces his intention of publishing an "Annuario del Mondo Latino," to serve as a yearly supplement to this Dictionary, and to provide a sort of "Who's Who?" for the literary *Monde Latin*—a world which, by the way, he construes very liberally (Rome: Published by the Author, 11 Via S. Martino). The second work is the twelfth (introductory) volume of the "Atti del Congresso Internazionale di Scienze Storiche," held at Rome in April, 1903. The "Atti" contain many papers of importance in many fields, besides that of history proper. The compilation of these voluminous proceedings has been in charge of Comm. Giacomo Gorrini, general secretary of the congress, and now director of the Archivio di Stato, at Rome.

There is no getting away from the fascination of a tale of exploration. The story may be wretchedly told; the writer may fail utterly to put into words what he has felt and seen; yet the reader, endowed with imagination, must catch between the imperfect words vivid glimpses of the wilderness, of nameless rivers whose sparkling waters are far removed from every touch of civilization, of lakes that have never yet been placed upon the map, waterfalls, and forests, and mountain peaks, all clothed in that atmosphere of romance that belongs to the unknown. When a story bearing this inherent charm is also well told, it is worthy of more than passing mention. Dillon Wallace's "Long Labrador Trail" (Outing Publishing Co.), a sequel to his "Lure of the Labrador Wild," is unquestionably such a narrative. In it he describes his expedition through the heart of the Labrador peninsula, from Hamilton Inlet to Ungava Bay, from Northwest River Post of the Hudson's Bay Company to Fort Chimo, and back again. The outward journey was by canoe to Lake Michikamau, thence down the practically unexplored George River to Ungava; the return journey by dogs led around the bleak, rugged Labrador coast. One gets from this narrative perhaps a clearer picture than has ever before been available of the characteristics of one of the least-known quarters of the Continent. The journey was an eventful one, not without danger, and demanding a good deal of pluck energy, and resourcefulness. It is just a little to be regretted that the narrative should be marred by an occasional note of —well, melodrama. Mr. Wallace takes himself and his achievement a trifle too seriously. When one remembers that explorations of at least equal difficulty and importance are carried through year after year by the officers of the Canadian Geological Survey, without the most remote suggestion of a flourish of trumpets, one finds the grandiloquence of Mr. Wallace's Introduction rather trying. Putting aside, however, this one slight blemish, the narrative is both interesting and valuable. A number of excellent photographic and other illustrations lend it an additional charm.

Possibly the best commendation which could be given for Joseph H. Adams's "Outdoor Book for Boys" (Harpers) lies in the fact that two little boys of the reviewer's family seized upon it and successfully constructed a Chinese kite according to its directions, before it had been in the house six hours. The volume seems to be eminently adapted to turning into profitable channels the considerable amount of playtime which a growing boy needs for his best development, but cannot well afford absolutely to throw away, so far as training for the future is concerned. The boy who gets interested in making his own sleds, toboggans, wigwams, pergolas, etc., is a much easier problem than the one who knows no source of supply but the shop. Many of Mr. Adams's suggestions are such as may be carried out with only the simplest tools, which every household needs whether it has boys or not, and with comparatively cheap materials. The first division of the book deals with the making of such things as children may enjoy within the bounds of a city home. In the next division, coasters, skees, snowshoes, kites, fishing-tackle, water-wheels, and other paraphernalia of field sports are considered. Boating is taken up in the next division, and finally life in the woods, including camping, trapping, the building of tree-huts, etc. In every case full and easily intelligible directions are given by which the boy may construct almost every part of his outfit for himself. We have seen no book of the kind so thoroughly practical and so well adapted to its aims as this.

The little "Glossaire des Classiques français du dix-septième siècle" (Paris, Hatchette), by M. Edmond Huguet of the University of Caen, deserves high praise. It contains in a single volume the chief words which have become archaic, and those more numerous and more treacherous ones, the meanings of which have been modified in the course of time. The definitions are based on Furetière, Richelet, and the first edition of the Dictionary of the Academy, and the author has sifted the chief modern glossaries of special writers, such as Godefroy's Corneille, Livet's Molière, and the Grands Ecrivains series. Each word is accompanied by numerous examples drawn from the texts. The book contains a great deal of information which can elsewhere be found only in more expensive and less handy volumes, and should be in the possession of all teachers and serious students of seventeenth-century French.

Mrs. Colquhoun Grant has chosen as subject of her "Queen and Cardinal" (E. P. Dutton) the mystery clinging to the relations of Anne of Austria and Cardinal Mazarin. The problem of their reputed marriage, which even this work does not solve, is framed in a series of chapters dealing with the social life of the first half of the seventeenth century. The romance of Buckingham's love, the conspiracy of Cinq-Mars, the marriage of Marie de Gonzague to the King of Poland, the intrigues of the Fronde, the schemes of Mazarin to increase his power through his nieces, the attachment of Louis XIV. for Marie Mancini are among the incidents chosen. The period, as Dumas and Alfred de Vigny have shown, affords rich material for the novelist, and many of the fair intriguers of the day, like Madame de Longueville, or like Madame de Chevreuse wandering about France disguised as a cavalier, seem to have stepped from the pages of fiction. Mrs. Grant has a knack of picturesque description, and of selection from contemporary writers of memoirs such as Madame de Motteville. Her volume should be attractive to those who, while interested in the bypaths of history, wish their study made easy.

We all know that growing section of the reading public whose attitude towards books is much like that of the Parisian diner-out listening to the suggestions of the maître d'hôtel. "Queen Hortense and her Friends," by Miss I. A. Taylor (Scribners), is one of a class which our literary maîtres d'hôtel are at the present moment placing on the menu with great regularity, and it is meant for those numerous readers whose mental energy is insufficient to take them straight to such delightful works of a past generation as the Memoirs of Méneval or of Madame de Rémusat. The author has been to these and a few other similar sources, culled the best anecdotes, put them into English, and, adding some well-chosen illustrations for sauce, served up a dish which is not bad of its kind. But although Miss Taylor affects the pose of the historian, let not the unwary be taken in; she clearly has done little else than get together enough picturesque material for her purpose; and she is not always even aware of the real authorship of the Memoirs from which she gives excerpts. Translation from the French betrays the author into unpleasant Gallicisms, but the book is readable, though not in the least authoritative.

Carl Trübner, of Strassburg, who recently died at the age of sixty-two, was not only a publisher of international fame, but also a scholar and a savant. He was born in Heidelberg, but received a good deal of his training in London in the book concern of his uncle, Nicolaus Trübner. His publications were almost all scientific, in recognition of which fact the Strassburg faculty gave him the degree of Ph.D., *honoris causa*. Probably best known in the academic circles of the world of all his publications is the international university annual "Minerva."

The death is announced of Dr. Cäsar Barazetti, professor of Roman law at the Roman Catholic University of Freiburg, in Switzerland. He has a number of legal works to his credit, including studies of the Code Napoléon.

The Rev. William Gunion Rutherford, LL.D., formerly headmaster of Westminster School, has just died in his fifty-fifth year. He was known, outside of his work in the school, as the author of a number of books on Greek philology, among them being "The New Phrynichus," "Thucydides, Book IV.," the first recension of Herondas, and his "Scholia Aristophanica" in three volumes. As headmaster he at first aroused some ill-will by his radical attitude toward certain of the cherished traditions of Westminster, but in the end he won the entire respect of the pupils.

MAKERS OF CANADA.

Lord Dorchester. By A. G. Bradley. Toronto: Morang & Co.

Wilmot and Tilley. By James Hanney. Morang & Co.

There is no further reason for bringing

these two volumes together than that they both come within the Makers of Canada series. Lord Dorchester belongs to the era of Wolfe and the American Revolution. Wilmot and Tilley were sons of New Brunswick, who flourished in or after the middle years of the last century. As historical figures, moreover, the three men are of disproportionate stature. Dorchester, apart from his share in the Quebec Act and the Constitutional Act, was the soldier who repelled the invasion of 1775. By virtue of service in both peace and war he is distinctly the most striking actor in Canadian affairs from the Cession to 1837. L. A. Wilmot and Sir Leonard Tilley, while endowed with excellent parts, were of provincial rather than national importance. Tilley, it is true, became minister of finance in the Federal Government, and Wilmot made a deep impression upon his American hearers at the Portland Railway Convention of 1850. But, speaking broadly, they were denied the field for the exercise of their talents that Dorchester possessed.

There is one serious disadvantage under which Mr. Bradley labors, and any future biographer of Carleton will be hampered in the same way. Lady Dorchester destroyed all her husband's correspondence, and for this reason we are thrown back on his official acts, together with the state papers which grew out of them. It is a great pity that circumstances should thus have denied us the means of approaching Carleton in private life, for from his justice, his humanity, and his breadth of outlook he is almost certain to have left in his letters a worthy record of the inner life which official correspondence can never disclose. Few can rise from the study of his public career without being moved by admiration for the *mens æqua in arduis* which shone through all his deeds. That we should know so little of his private tastes and aspirations must ever remain a source of deep regret.

Guy Carleton was born in County Down and belonged to one of those Anglo-Irish families who have given Ulster its fame for energy and resourcefulness. His whole life prior to 1766, when he arrived in Quebec to take charge of Canada, Mr. Bradley is able to dismiss in four pages. He had entered the army in 1742 at the age of eighteen, distinguished himself under Wolfe during the siege of Quebec, and in 1762 had been prominent at the siege of Havana under Albemarle. With a training purely military, he had arrived on the banks of the St. Lawrence at the age of forty-two, to administer a region in which political problems were many and acute. With one of these his name will continue to be more closely associated than it is with any feat of arms save the defence of Quebec against Arnold and Montgomery.

We refer here to the question of race as affecting legislation. Carleton found more than 60,000 French Canadians in collision with three or four hundred English settlers, who had entered Canada in the train of Wolfe's victorious army. The newcomers despised the French for their ignorance, superstition, and backwardness. But, if we may believe Gen. Murray, the first English Governor of Canada, the French Canadians were far more desirable citizens than their critics. It was in Carleton's time, however, that the British Government took the grave step of deciding in favor of the conquered French as against the handful of Englishmen whom trade had brought from the American colonies to Montreal.

An intelligent outsider like Siegfried finds the *nœud vital* of Canadian politics in the race question. Undoubtedly, the era of Carleton was a critical moment in that the British Government was forced to decide whether the French Canadians should be Anglicized by the abrogation of their ancient laws, or whether an attempt should be made to keep them loyal through generous treatment. At present, when the filling-up of the Northwest bids fair to depress the political influence of Quebec, the English Canadian often laments that a clean sweep was not made of French institutions, and the French language during the first generation after the Cession. But, apart from the inferior character of the English then living in Canada, and the harshness of abrogating usages which were dear to a vast majority of peaceable citizens, Carleton could see no reason why the future should exact from him an act that to the present must seem cruel. In other words, he cannot be accused of having shut his eyes to consequences for the sake of adopting a purely opportunist policy.

Events have shown that in one important regard Carleton argued from false data. Like all good administrators he was inclined to lay stress upon what seemed reasonable, upon what might be called good business. Here one capital consideration was ever in his mind. Canada, he thought, would never be occupied in any real sense by the English. The fur trade might bring a few of them to the cities, but they would never seize upon the open country or be more than a fragment of the population. The passage which best sums up his views on the subject occurs in the letter of November, 1767, to Lord Shelburne. European emigrants, he says, "will never prefer the long inhospitable winter of Canada to the more cheerful climate and more fruitful soil of his Majesty's southern provinces." As for the English at present in Canada, they have drifted in mainly through accident, and have not the qualities required of permanent settlers. More important still is the following sentence:

> But while this severe climate and the poverty of the country discourage all but the natives, its healthfulness is such that these multiply daily, so that barring a catastrophe shocking to think of, this country to the end of time must be peopled by the Canadian race, who already have taken such firm root that any new stock transplanted will be totally and imperceptibly hid among them, except in the towns of Quebec and Montreal.

These words, it will be noticed, were written sixteen years before the Loyalists began their emigration into the Wilderness, and the political movement which led to their exodus could not well have been foreseen in 1767. At the same time Carleton was far from having the prophetic sense which enabled Talon, Frontenac, and La Salle to realize what might be the fortunes of the Laurentian valley in conjunction with the vast western region to which it led. Had he known the West at first hand, his diagnosis of the situation might have been quite different, but in estimating the merit and faults of his policy it must be grasped as a cardinal fact that for Carleton in 1767 Canada was a land which extended from Tadousac to Lake St. Louis.

We lay chief stress upon Carleton's attitude towards the question of race and institutions, because he was mainly instrumental in shaping conditions which affect the daily life of Canada at this moment. As a soldier, he is most conspicuous for his defence of Quebec against American attack, but potentially he was a greater general than can be gathered from any survey of what he actually accomplished. Save for Lord George Germain and Sir John Burgoyne, he might have taken a leading part in the Revolutionary War at a juncture when the British cause had not yet been lost through the lack of qualities which Carleton possessed. His humanity in the conduct of warfare is recorded in the journals of the men who followed Arnold, and also by those who came in contact with him during the closing months of the Revolutionary War, when he had been sent to replace Clinton.

As Carleton's biographer, Mr. Bradley starts out with a good general knowledge of Canadian history. In the structure of his book he has been careful to avoid small issues for the sake of discussing at large the problems which were presented to the British during their first occupation of Canada. There is still ample room for many a monograph on topics which Mr. Bradley touches but lightly; for example, the causes and circumstances of the friction between Carleton and Burgoyne. When twenty or thirty studies, each of them as long as Mr. Bradley's whole book, have been written on the period which is covered by Carleton's residence in Canada, a somewhat fuller and surer biography can be produced. But in the meantime Mr. Bradley's life of this eminent man will do good service, and one can say with confidence that it is much better than all save a very few of the volumes in the series to which it belongs.

In Mr. Hannay's sketch of Wilmot one is first given a sad account of public life in New Brunswick, as it was before the people of that province battled for responsible government: "The two Odells, father and son, held the office of provincial secretary for sixty years. . . . One of the greatest offices in the province—that of the surveyor-general, was held by one person for thirty years, and this individual was in no sense responsible to any authority in New Brunswick, except the Governor. Those in power at that day were very fond of expatiating on the glories of the British Constitution, and the privileges that people enjoyed under it. But nothing less like the British Constitution can be imagined than the system which then prevailed in the British North American Colonies. As late as 1845 Sir William Colebrooke, just one week after the death of Mr. Odell, appointed his son-in-law, Alfred Reade, who was a native of England and a stranger to the province, to the vacant office of provincial secretary."

Against the régime of privilege and favoritism L. A. Wilmot protested with much vigor, and from being the most eloquent speaker in New Brunswick he had no trouble in holding up to ridicule an indefensible system. One cannot pretend that he was a

good lawyer or a deep thinker. Wherever he went he carried with him the temper of the advocate, indeed the temper of the *nisi prius* pleader. "He always took a great interest," says Mr. Hannay, "in questions relating to the Bible, and frequently lectured on topics connected with it. He vehemently opposed the teachings of Darwin and others who followed the same line of inquiry, and he stoutly maintained that wherever the Bible and science were in conflict, science was in the wrong. He seems to have been, from first to last, an unquestioning believer in the doctrines of the Christian religion, and he viewed with great disfavor any one who ventured to question any part of its creed." Though discursive in both thought and speech, Wilmot was a man of unusual oratorical gifts. Considering the undoubted priority which he enjoyed for many years in the Legislature of New Brunswick, he has an unquestioned right to appear in the present series. Less celebrated than Mackenzie and Papineau, he wrought, *mutatis mutandis*, the same sort of work which they wrought in Upper and Lower Canada. Sir Leonard Tilley owes his place in Canadian public life to his fight against the opponents of Confederation in New Brunswick. At the beginning of 1865 the province was almost solidly opposed to union. By the summer of 1866 it had made a complete *volte-face*, thanks, in the main, to Tilley's efforts. This, at least, was his most shining achievement.

Mr. Hannay's volume is really a sketch of public life in New Brunswick as it centres for almost fifty years around two outstanding leaders. The subject has not quite the same interest which belongs to the larger, more spirited episodes in the history of this continent, but that is not Mr. Hannay's fault. Dealing with somewhat commonplace material, he has at least brought to it fairness of spirit and fulness of knowledge.

CURRENT FICTION.

Father Felix's Chronicles. By Nora Chesson. New York: A. Wessels Co.

If "Father Felix's Chronicles" suggest Maurice Hewlett, it is by no means in the way of imitation, conscious or involuntary. Merely, like Mr. Hewlett, the author gives a sense of being steeped in her period (the reign of Henry the Fourth), of being possessed by it. This is no question of scholarship or industry. Learning abounds and traces of patient and happy labor, but these are incidental. The point is that this lady has a vision, a shuddering realization of the Middle Ages flashing with beauty of costume, illumined by piety, dark with unspeakable cruelty and fanaticism. She has absorbed tradition, custom, and legend till her pictures are as minute as the bordering of a patiently wrought missal. They almost convey the sense of physical contact with some huge old volume, the commentless chronicle of a monk's long life. Her story glides under way with admirable skill—a scene, a character touched, retouched, a phrase knowingly repeated, until Alice and Edith and Hawise stand free and separate, clear of their elaborate background. She manages her Benedictine Father so deftly as to avoid all those distressing devices by which narrative in the first person is usually made plausible. If here and there she calls upon the reader for agile wits to span the meaning of an elision, the momentary gap only adds to the atmosphere of mystery with which her story is beset.

The procession of characters press upon one another as in an overcrowded tapestry, yet as the eyes grow accustomed to the dim light and unused figures, you come to distinguish certain recurrent forms, slim pages, Saxon ladies and Norman—they appear in clear tragic sequence—men at arms, the Jew boy who served the leper, the hunchback maid of honor bound to the whipping post, the dungeon with Siward's sleeping talk of the scaffold! The whole is so encrusted with wealth of character and event that you hurry on with unflagging zest, even if a trifle confused at times by the mere abundance; yet the impression left is deep and in true perspective. You feel a time of terror, of doubt as to the next day's chances, of each town and castle isolated, like a faintly flickering torch, in a circle of countryside dark with war and conspiracy. The climax itself is full of almost unbearable pain, so delicately managed, however, that after reading with positive physical reluctance, you are bound to confess that the effect has been produced by entirely legitimate means. Your imagination has been played upon, Oedipus has not been mutilated before your eyes.

And while a steady crescendo of pain dominates, it is nowhere confounded with ugliness. The book is pervaded by a wholesome beauty, a sense of all the things that go to make up the thrilling England of romance. The very language is so contrived as to ring with a sonority which gives charm even to long pages merely enumerating flowers, costumes, or devices of men at arms.

Moreover, throughout the rich and gloomy fabric of her story, the author weaves fragments of verse, many of which bear the imprint of unusual talent. Some of these have sufficient character even to stand the test of transplanting from their natural setting. Some are meditative, some fresh with a vernal impulse almost in the spirit of Chaucer, but, perhaps, the most charming in its directness and simplicity is the snatch of ballad young Owen Glendower sings, when King Richard's conspirators are brewing mischief at Havering:

> The burden of dead ladies
> (Dead long ago),
> Swart Egypt and White Helen
> Who brought Troy low,
> The damoysel Sir Gwydion
> Made from a flower,
> And little maiden Barbara
> High on her tower.
>
> The burden of old battles
> And broken swords:
> And the burden of drowned cities
> —Ys and her lords:
> The burden of the east wind
> That will not rest:
> The burden of dead ladies
> Goes mournfullest.

Although prefaces are not supposed to wield a powerful influence, baleful or the reverse, upon the majority of novel readers, it may well be that the Introduction to this remarkable story will create antagonism. It consists of a husband's impassioned appeal for recognition of his dead wife's genius and a description of her work in the most fantastic and morbid strain of contemporary English mysticism. Only its obvious and touching sincerity saves this sovereignly unpleasing Preface from being at once tasteless and ridiculous. Shocking it is, and calculated to inspire distrust in the genius it so eagerly proclaims. Nevertheless, in spite of this serious handicap, the book itself shows ability of so rare an order as to point an instructive difference between a real creation and the flimsy stuff passing current as historical fiction.

The Scarlet Car. By Richard Harding Davis. New York: Charles Scribner's Sons.

If, as the publishers assure us, there is such a thing as summer reading, Mr. Davis certainly deserves a place in the van of the summer writers. His tales have just the combination of romance, humor, smartness, and nonchalance to fit the sauntering, hammocking mood which holds under the dog-star. It is true that what seemed—was it twenty years ago?—to some of his young contemporaries a new genius in fiction, has turned out to be but a moderate talent. One hesitates to assert that his current work is not as good as the Van Bibber tales. The truth probably is that he continues to address himself to that deciduous audience of youth from which each in his turn must take the fatal drop. So to the cold eye of middle age it seems that in "The Scarlet Car" Mr. Davis simply "has his whack" at the fashionable motor-yarn of the moment. The tourney and the battles long ago, the boating and the racing and the hunting, that have sufficed sporting fiction for generations, are put aside for the nonce by this fad of the car and the speed limit. Let us recall the brief hour of the bicycle and of golf, and bide our time. Mr. Davis spares us the lingo, or at least does not focus our attention upon it for its own sake; the scarlet car is a friend, an enemy, sometimes even a vehicle, but never the hero of the story. The hero is one of those genial, healthy, wealthy, and rather useless youths destined to win the lady by sheer perseverance, plus opportunity. His relation to her is given the desired tang by the fact that she is engaged to be married to another man. The other man is conveniently a fool and a coward, as well as a person of ambition and capacity for work. The function of the car is obvious: to become, by this or by that, the means of their isolation from an unnecessary world, and, finally, to waft them to the desired haven. The amusing incidents which happen by the way are appropriate to the undisguisedly farcical nature of the whole affair.

A Stumbling Block. By Justus Miles Forman. New York: Harper & Bros.

This novel belongs to that class turned out in quantity every year, to which no possible objection should be made, if—merely this—if any one can discover the smallest reason for reading them. Its central theme is unimpeachable, the vampiring of a genius by his neurasthenic wife. The Englisb is also unimpeachable, or as nearly so as English can be which entirely lacks the indefinable gift of style, the rhythm, the condensation making the difference between intelligent narrative and the tongue of a real story-teller. In the matter of treatment Mr. Forman's touch is uncertain,

not to say immature. Of course his hero knows how to order a dinner even so as to command respect in a New York waiter. Since Van Bibber set the pace, all leading young gentlemen in fiction have mastered that delicate accomplishment. The situation between David and his wife, however, calls for a different type of realism. The means by which this situation is brought about are frankly novelesque and artificial.

Old Robert Henley stands in such dread of seeing David's "genius" (an attribute never quite proven) hampered by entanglement (an honorable engagement), with a singularly beautiful and praiseworthy young lady, that he sends him away for several years, to tread the safe path of youth with a full purse, foot-loose in Europe! On coming home to America, David is kept from Rosemary by pretexts too feeble even plausibly to hoodwink a genius. The neurasthenic lady makes a dead set at him, and from the moment they leave the altar, proceeds to sap his vitality. Of course the unhappy pair drift back to David's native village, where Rosemary has waited for him. The reunion of these two perfectly virtuous lovers is managed with complete decorum and the aid of one of those convenient medical episodes less frequent in life than in fiction.

The Life and Times of Lucius Cary, Viscount Falkland. By J. A. R. Marriott. New York: G. P. Putnam's Sons. $2.25 net.

Mr. Marriott is right in saying that Falkland has not received justice at the hands of Macaulay, Gardiner, and Carlyle —how, indeed, should such a man find appreciation in those quarters?—but in forming his estimate of the position held by Falkland to-day he gives scarcely sufficient weight to the viscount's admirers. Few Englishmen have been more fortunate in praise. In the seventeenth century—the age of noble encomiums above all others—he had the friendship and glowing admiration of Ben Jonson and Clarendon; Matthew Arnold has devoted to him an essay of whole-hearted laudation; his portrait furnishes the most interesting chapter to one of the wisest of books on the century, Tulloch's "Rational Theology and Christian Philosophy"; and now, we may add, he has been lucky in his present biographer.

Mr. Marriott writes from a full knowledge of his particular subject and of its background, which is more than can be said of most of the popular biographies of the seventeenth and eighteenth centuries. The two chapters on the Problem of the Age, Political and Ecclesiastical, are necessarily succinct and elementary in tone, but they say just the right thing to introduce the hero of the tale upon the stage. Just a touch, perhaps, is lacking to the section that deals with Falkland's life at Great Tew, his "little university." The facts are well presented, the characters clearly drawn, but the transmuting skill is not present that would make literature of one of the richest themes in English history. Clarendon's account of that beautiful interlude in Falkland's life is well known, and has, of course, been quoted by Mr. Marriott:

> Truly his whole conversation was one continued *convivium philosophicum*, or *convivium theologicum*, enlivened and refreshed with all the facetiousness of wit, and good humor, and pleasantness of discourse, which made the gravity of the argument itself (whatever it was) very delectable. His house, where he usually resided (Tew, or Burford in Oxfordshire), being within ten or twelve miles of the university, looked like the university itself, by the company that was always to be found there. There were Dr. Sheldon, Dr. Morley, Dr. Hammond, Dr. Earles, Mr. Chillingworth, and, indeed, all men of eminent parts and faculties in Oxford, besides those who resorted thither from London; who found their lodgings there, as ready as in the colleges; nor did the lord of the house know of their coming and going, nor who were in the house, till he came to dinner or supper, where all still met; otherwise, there was no troublesome ceremony or constraint, to forbid men to come to the house, or to make them weary of staying there; so that many came thither to study in a better air, finding all the books they could desire in his library, and all the persons together whose company they could wish, and not find in any other society.

Happy academe, where so much of the wiser and more tolerant thought of the age was brewed in discourse, and actually, like Falkland's own tractates and Chillingworth's "Religion of Protestants," written out for the press. The tragedy of Falkland's life is that one whose motto was "Where it is not necessary to change, it is necessary not to change," should have been cast in an age of sudden revolutions and violent animosities. But if a moderate, he was not an indifferent. In the Short Parliament and in the first years of the Long Parliament he played a brave and influential part. He was with those who dragged down Strafford; he voted for the exclusion of the bishops from the House of Lords; but when in place of the rule of "Thorough" which he had helped to destroy, Parliament took up the equally despotic system of "Root and Branch," Falkland tried to stem the rising fanaticism, and, failing in this, withdrew to the King's party and died bravely, if not rashly, at Newbury. It does not seem to us that even the slight tone of apology, or at least defence, adopted by Mr. Marriott is needed. In all that band of bigots there was no one who acted from beginning to end more consistently with his own principles than this man who chose the hard and dangerous middle path. How should he have been at home with the Puritans—he who held "that Truth in likelyhood is where her author God was, in the *still voice*, and not in the *loud wind*"? How should he have found comfort in the councils of the King's army—he who "when there was any overture or hope of peace, would be more erect and vigorous, and exceeding solicitous to press anything which he thought might promote it; and sitting among his friends, often, after a deep silence, would, with a shrill and sad accent, ingeminate the word *Peace, Peace;* and would passionately profess, 'that the very agony of war, and the view of the calamities and desolation the kingdom did and must endure, took his sleep from him, and would shortly break his heart'"? We are readier than is Mr. Marriott to accept Whitelocke's gossiping report that Falkland, in the extremity of his grief and seeing the inevitable *débâcle* ahead, did practically throw away his life in the brunt of battle.

He cried peace, when there was no peace. Indeed, he cannot in any full sense of the word be called "great"; always, as a writer, a speaker, a man of action, he shows something of the enthusiastic amateur in his efforts. Mr. Marriott, we think, rather errs in forcing the note of his efficiency, for his true praise lies otherwhere. At the time of his early death he might have seemed to have lived and striven in vain. But as the years pass and the strident voices of the contention are no longer heard, the principles for which he suffered come to their own. Somehow, time has a strange trick of justifying the failures of the wise above the achievements of those who fight strenuously for a half-truth. The present was for Laud and Strafford, for Pym and Cromwell, but the future was for Falkland and the little band who saw the truth in its larger and more permanent aspects. The future is always with the moderates.

The Romantic Revolt. By Chas. E. Vaughan. (Periods of European Literature, edited by Professor Saintsbury.) New York: Chas. Scribner's Sons. $1.50 net.

It is only in a limited and qualified sense that Professor Vaughan's book can be spoken of as comparative history—indeed, it is something of a liberty to speak of it as a study of romanticism at all. It contains, to be sure, frequent references to "romantic ideals"; but it makes no very serious effort to define them. Neither in the author's narrative nor in his commentary do they come out, as it were, self-consciously. Nor does the volume explain much more satisfactorily the internal development of romanticism, the modifications suffered by the idea itself. How the romanticism of Herder, for example, ever came to be that of Tieck and the Schlegels, is as much of a problem at the end of the discussion as at the beginning, while the relation of French romanticism to German and English, or, in other words, the "comparative" problem, is hardly touched.

The fact is that the distinction between classic and romantic, useful as it is in a general classification and broad survey of literary tendencies and dispositions, is apt to break down when applied in detail. Like the division of humanity into good and bad, it furnishes a convenient form of thought, but fails to define any particular individual. Even the single schools, self-styled, of France and Germany—to say nothing of that of England, which stands singularly aloof from the others—have so little in common that the name becomes in such cases a more or less specialized or technical designation without general significance. In short, in this instance, as in all matters involving human genius, the essential thing is difference, not resemblance; it is the variation that counts. "Ethan Brand" is to be found in Hawthorne's notebook, pretty nearly all of it except Ethan Brand himself, and the whole Shakespearean drama, no doubt, is to be found everywhere—save what is Shakespeare's. What makes so much of our "comparative" literature of small account, is the failure to perceive this fact, and the insistence upon all kinds of transfers as though they were of the utmost importance. With what show of reason, for instance, are Lessing, Burke, and Goethe to be included in the same category with Hugo, Arnim, and Novalis? Surely the answer to such a question, even if it

were possible, would be of no great relevancy.

Such an answer, at all events, the author has not succeeded in finding. And in default of it he has been obliged to use the term romantic merely as a convenient label for a certain chronological period, and to give it so broad an extension as to deprive it of any definite content in particular. In this sense romanticism is nothing more alarming than a purely instinctive reaction or revolt against neo-classicism—or better, pseudo-classicism—against the second-hand and the artificial. Even a return to an original classicism, such as that of the Greeks, seems to constitute for Professor Vaughan a phase of romanticism. At least, Goethe's "Iphigenie" looms as large on his horizon as "Götz." In this way the volume resolves itself into a series of sketches of the literatures of Europe from the death of Voltaire and Rousseau to that of Schiller. Its province, therefore, is comparatively limited; it deals with a period of transition or preparation rather than one of fulfilment. And it may be that something of its unsatisfactoriness is due to the fact that the movement which it undertakes to trace had not yet defined itself clearly.

As it is, however, the volume differs little from any other sketch of the sort—with the exception of these recurrent references to romanticism already mentioned. There is the usual inclination to discuss the succession of books rather than the sequence of ideas. There are the stock estimates of criticism, the *dicta* and things generally agreed upon, though relieved now and then by a happy *aperçu*, *e. g.*, the judgment of "Wilhelm Meister," and the analysis of Burke. On the whole the German division is the most interesting. In the case of English, Professor Vaughan has labored in vain against the lack of clear ideas and conscious tendency which makes the subject obdurate to such treatment as the method proposes. But even in German he shows comparatively little sense for the significance of the movement which the Schlegels originally headed. He discerns in a general way its influence on modern literary thought; he perceives severally its individual features—its impatience of tradition, its disdain of the painfully acquired lessons of human experience, its cult of ugliness, its incurable levity and perversity. But the extent and bearing of all these matters as a whole seem to escape him; he fails to see or at least to make clear that if there is one thing certain, it is that these men and their successors have imposed upon criticism an incubus of which it is apparently powerless to rid itself for yet many a long day.

Essays Critical and Political. By J. H. Balfour Browne. 2 vols. New York: Longmans, Green & Co. $5 net.

These essays with few exceptions appeared in the *Westminster Review* between 1876 and 1886. Half of them are about political matters, such as the "African Slave-trade," "English Supremacy," "England in Egypt," which have changed since the papers were written. The opinions expressed could at most have an historical interest. It is a pity that the others, dealing with literary questions, were not published without this "dead-wood."

The unsparing frankness of the essays on "George Eliot as a Novelist" and on "Theophrastus Such," published in the *Westminster* in 1878 and 1879, is rather surprising, all things considered:

> George Eliot now makes fun as if she were a little old and tired of it. We think these passages [in "Middlemarch"] contrast but poorly with those in her earlier works, while in "Daniel Deronda" there is a plentiful lack of humor of any kind. We confess that our liking for that sad and futile novel, "Middlemarch," is greater than for the so-called "hopeful" "Daniel Deronda." Here we cannot find those indications of preëminence which were not wanting in its predecessors.

On "Theophrastus Such" the critic is very severe. He finds it "burlesquing," "sneering," "without any high purpose," and often "unintelligible."

These plain-spoken verdicts, which have been generally confirmed, give more weight to his eager enthusiasm for the earlier works; and altogether it would not be easy to name a keener and sounder estimate of the novelist.

There is an admirable study also of Charlotte Brontë, in which the superiority of her sister Emily's genius is recognized:

> In Emily's rather than in Charlotte's work we find the true creative faculty. . . . Charlotte has continued for us existences which were, and which cannot die; Emily has created people who never were, but who are now immortal.

And the essays on Landor, Dickens, Michael Angelo, and Machiavelli all show an insight and are written with a force quite out of the common.

Science.

Infant Mortality. A Social Problem. By George Newman. New York: E. P. Dutton & Co., $2.50 net.

The questions raised by Dr. Newman are not novel, but his facts, as well as much of his discussion of them, deserve thoughtful consideration. They touch upon what seems to some the most valuable and vital part of settlement work; and, while much that he has to say is already familiar to many, there are others who will be glad to have this account of the subject. The statistical introduction deals chiefly with the returns for England and Wales, and by several diagrams illustrates the distribution of infant mortality, according to counties.

The figures are depressing. The general death rate in these countries is steadily falling, coming down from 22.2 to 18.2 in succeeding decades, from 1851 to 1900, and reaching 16.0 for the quinquennial period 1901-05. The birth rate is also falling, dropping from 34.1 to 28.4 for the same periods; in 1905, it was 27.2. This, taken by itself, might seem no unmixed evil, but it acquires a very different significance when we learn that there is no diminution in the infant mortality rate, by which is meant the number of deaths of children in the first twelve months of life, as compared with a thousand births for the same time. This rate for 1901-05 was 138; for the five decades, 1851-1900, it ranged between 154 and 142, and showed little tendency to change. A simple recalculation of some of the tables brings out the more impressive fact that the deaths of infants form nearly 24 per cent. of all the deaths in England and Wales, and that this percentage seems on the whole to be really increasing; it was just under 23 in 1851-70; it somewhat exceeded 24 in 1891-1900, and was just under 24 for 1901-05; but this percentage is the same as in 1871-80. The rate is much higher in certain other countries, and nearly everywhere shows no definite tendency to diminish; but there are a few exceptions, as Australia, Netherlands, Switzerland (145), Denmark (133), Iceland (104), Sweden (99), Norway (94), New Zealand (82). There is, however, some uncertainty as to the comparability of such statistics.

In round numbers, then, 1,000,000 children are born each year in England, and 500,000 persons die, and of these at least 120,000 are children in their first year; and of these again, nearly half die in the first three months. This trimestral proportion appears to be increasing, even now, and the percentage of such deaths was nearly seven higher in 1904 than sixty years ago. Such figures are yet more striking when we recall that in the last fifty years the decline in the death rate has been most marked for the years between 5 and 25 (about 50 per cent.), and for those under five has been 14-15 per cent.

The causes of this state of affairs are discussed by Dr. Newman at some length on the basis of English statistics and conditions; and he is able to draw many illustrations from his experience as medical officer of the borough of Finsbury. He recognizes more clearly than some writers on this subject have done that the problem is very complex, dealing with many variables, not to say unknown quantities. When the infant mortality rate is examined more fully, it is found to be higher, as a rule, in towns, and because of a steady increase in prematurity, pneumonia, and epidemic diarrhœa as causes of death, it does not decline. In 1801 about one-sixth of the population lived in towns of over 20,000; in 1904 nearly six-tenths lived in such towns. Urban life may mean improved sanitation and other advantages, but it may also bring many evils in its train; and the figures show that infant mortality is higher in the towns. Such figures call for careful interpretation. Urban life is not uniform, and there are usually enormous sanitary inequalities whose localities and limits are not sharply defined. All this comes out clearly in the comparison of statistics for London in general, and for Finsbury in particular, too extended for quotation. In towns also the general mortality is higher; and this is interpreted to mean that excessive infant mortality cannot be altogether due to improper care and poor feeding.

Much may be expected from improvement of the dwelling and from more thorough sanitation of the town—questions, it may be added, no less urgent in many American communities than abroad—but, after all, "infant mortality is a social problem concerning maternity." Nearly a third of the deaths of infants is due to immaturity; in some districts the proportion is even larger. Here the occupation of the mother, her poor physique (in-

which we must include the effect of certain toxic substances, as lead, mercury, alcohol, etc.), and poor nutrition, play a considerable rôle. Besides prenatal harm, the occupation of the mother acts disastrously in depriving the child of care that is all-important, even if it be not altogether intelligent. The various protective agencies available are fully discussed.

For the child the most potent preventive measure is perhaps that of proper food. The book demonstrates anew that unsuitable or spoilt food is the source of much danger to the infant, and that the substitutes for the natural food of the first year require not merely sound judgment in selection, but also vigilant care in the giving. Dr. Newman adds an interesting account of his own effort to supply Finsbury infants with suitable modified milk, and also some account of what has been done elsewhere abroad. That he manifests little familiarity with the work done in this country in no way detracts from his presentation of the subject. He believes also that other agencies must be employed, and sees in the medical inspector and in women, acting as visitors and advisers, the most valuable aids for the enlightenment and training of mothers. The school training of girls with regard to sanitary matters as well as the selection of nutritious food and its proper preparation he also holds to be helpful for this generation, and yet more for the next.

Despite the mass of figures, the book, handsomely printed and pleasant to handle, seems remarkably free from misprints. The table on page 3, evidently, should refer to infant mortality rates according to births, and not according to population; and on page 12 there is a slight confusion as to percentages.

The New Library of Medicine, under the editorship of Dr. C. W. Saleeby, now appearing in England, is to contain a score of volumes treating a variety of general questions in a manner to interest medical men and "intelligent laymen." Several of these books have also appeared with an American title-page, but without a clear indication that they belong to a series. The latest is "The Hygiene of Mind" (E. P. Dutton & Co.), by T. S. Clouston, long known as a student of mental disease, a book that parents and others will find helpful in its suggestiveness rather than in definite directions or explicit advice. There are entertaining chapters on the different periods of life, on marriage, with an incidental word in behalf of divorce, and on decadence. It is interesting to note, amid the diverting disagreements in the discussion of the transmission of acquired characters, the insistence of the author that in the field of psychiatry the facts seem to indicate that the sins of one generation reappear very definitely in the next, and later yet. Possibly a more refined analysis may show that all this depends on malnutrition and environment, varied concomitants of inheritance, rather than the mere substance of inheritance; but, at present, he regards heredity as a causal agent in disordered and undeveloped minds "in a greater degree than in any other disease." The remedy is to be sought in nutrition and careful upbringing, including a special effort not to "overstimulate, or over-educate, or over-press the mind."

Dr. Karl Grassmauer of Munich publishes in the *Allgemeine Zeitung* of that city, under the title of "Modernes deutsches Kurpfuschertum," surprising data showing that Germany, with possibly the sole exception of England, has been the most easy-going of modern States in allowing medical men without a medical schooling to practise the art of healing. German laws demand for practice only two things, namely, that a man does not advertise himself as "Arzt," and, secondly, that he does not travel around in the hunt for patients. As a result the author declares that while there are in the Fatherland some thirty thousand physicians with university preparation and degrees, there are from twelve to fifteen thousand "wild" physicians, who have practically no medical training at all. The increase in the ranks of these non-academic practitioners has been remarkable. Between 1874 and 1903 their number in Saxony grew from 323 to 1,001, an increase of 209 per cent., while the population increased only 61 per cent. Exactly the same relative increase is reported for this period from Berlin. Recent statistics show that 16.6 per cent. of these non-academic doctors have been fined for malpractice, and in Berlin even 30 per cent. A vigorous propaganda is being inaugurated by the medical and the legal professions to stay this growing national evil. The discussion here mentioned appears in Nos. 113 and 114 of the Supplement.

The plenary meeting of the International Association of Sciences, in convention recently in Vienna, decided to publish complete editions of the works of Leibniz. The task of preparing and issuing this edition has been assigned to the two Paris societies and that of Berlin. The bulk of the preparatory work has in fact already been done by these bodies.

The annual report for 1906 of Dr. C. G. Seligmann, pathologist of the London Zoo, has just been published. Among the monkeys, thirty-four deaths from tuberculosis are recorded, as against fifty-three in the preceding year. In our own New York Zoological Park only three monkeys in the collection died from this dread disease during 1906. In the London Gardens no fewer than eighty-six birds, or 30 per cent. of the total number of deaths recorded, succumbed to tuberculosis, the infection taking place by the swallowing of contaminated particles of soil picked up with the food. A remarkable fact was noted in the extremely flabby condition of the heart in many storks, ostriches, cassowaries, and rheas, death in a number of cases being due to cardiac failure. Lack of sufficient exercise doubtless accounts for this unusual state of affairs.

Prof. Heinrich Kreutz, editor of the *Astronomische Nachrichten* since 1897, died July 13, in his fifty-third year.

Drama and Music.

C. H. Brookfield is writing a play of which the hero is to be Queen Elizabeth's favorite, the Earl of Essex.

Nothing new has come from the pen of H. V. Esmond, of late, but it is said that he has no less than three plays ready for production, all of which will be seen in London this year. One of them is called "Under the Greenwood Tree," and the principal female character will be assumed by Maxine Elliott. The scene is laid in the heart of the New Forest and the story is one of an out-of-door life, free from the artificial conventions of modern town society.

It is said that Hall Caine has already received nearly $500,000 in royalties from "The Christian."

Among the authors of the various short pieces which Arnold Daly promises to produce in the Berkeley Theatre of this city are Mark Twain, Charles F. Nirdlinger, W. W. Jacobs, Gladys Unger, Cosmo Gordon Lennox, and George Bernard Shaw. Apparently, Mr. Arnold means to make his appeal to a limited class of playgoers, realizing that his theatre has small accommodation for the general public. It is agreeable to be assured that his performances are to be modelled upon those of the Théâtre Antoine. This can only mean that there will be some first-class acting, though nothing is said about the players who are to provide it.

Reports come from Rome of the great success of a powerful and imaginative play called "The Wanderer," by Signor Moviceli. The hero is a dreamer of lofty ideals to which he hopes to convert the world. Leaving his family in the charge of his brother, he sets out on a pilgrimage. For twenty years he labors in vain, and then returns home to find himself estranged from his family. Soon he quarrels with his brother, who has political ambitions, and finally decides to resume his pilgrimage, realizing the fact that for him home no longer exists. The contrasting characters of the two brothers are said to be drawn with great skill, and the piece is described as being full of dramatic situation.

Vocal Faults and Their Remedies. By W. H. Breare. New York: G. P. Putnam's Sons. $1 net.

It is refreshing to come across a book on the vocal art free from the usual silly lamentations about the "lost art of *bel canto*." In the preface to Mr. Breare's volume it is maintained that whereas in the olden days listeners expected to be astonished by vocal agility, we are no longer satisfied with mere beauty of vocal tone and ornamental devices. We demand appropriateness of tone-color and dramatic consistency, and, above all, perfect speech in song. "It is a different and really a higher phase of the old *bel canto;* for it is more intellectual, exacts wider knowledge, and is more sincere. It requires more thought than the cult of the Rossinian school, and much deeper study."

This preface, to be sure, was not penned by the author of the volume, but by an English journalist, F. Gilbert Webb. Mr. Breare, however, undoubtedly endorses his sentiments. Without going so far as Mr. Webb, who calls this "the most complete guide to singing in English yet published," one may concede that it contains much that is valuable and well expressed. The author is an American who migrated to England

and there became a teacher of singing and a critic. His book contains, he says, the results of personal experiences during a career of nearly half a century. The plan of it is commendable. In addition to a series of chapters on the Breath Problem, Tongue Troubles, Mouth Positions, Tone Colors, etc., he devotes brief sections to special instances of vocal faults, such as bad high notes, voice cracking, uneven tone, too open tone, cat quality, voice jarring, imperfect rhythm, lifeless tone, foghorn qualities, wheezy tone, a throaty consonant sepulchral tone, etc., following up the statement of each case with brief directions for overcoming the defects described. The troubles of singers are rendered the more acute by reason of the fact that they cannot really hear the true sound of their own voices, but need some one to coach and correct them. In the author's opinion, this is true not only of students but of experienced singers, including some of the greatest, who are apt in course of time to underdo or overdo. "It is because a singer cannot perfectly judge his own voice and effects that he must be periodically 're-tuned' in order to correct faults which have really grown out of virtues, through exaggeration."

The primary cause of this trouble is, in the author's opinion, neglect of technique in quest of more "soul"; yet on another page he informs us that he seldom employs scales or exercises—a point on which other vocal experts are likely to differ with him. The cultivating of the lighter quality of voice (the tenor voice by a baritone, the soprano by the contralto) which he commends, is best done by scale practice, by beginning high and carrying down into the voice the head quality which should exist even in the deepest chest tones. If the singer has this perfect head quality there will be no difficulty in any words—no "troublesome words," such as the author discusses in one of his sections. One may question the wisdom of Mr. Breare's advice to the teacher to abstain as much as possible from mentioning the breath, and to teach the art of breathing unconsciously. The singer cannot get the diaphragm pressure unconsciously. But we agree with him that "the less a singer thinks of his tongue, the better." Perhaps the author insists too much on the position of the lips. Jean de Reszke maintains that the lips should be pliant but practically unchanged. To insist on changes makes the pupil too self-conscious. Much good advice is condensed in the summary. Among his maxims are two which teach truths that ought to be self-evident, but which very few vocalists heed: "Before you sing a note, ascertain the meaning of the words you are to sing." "You must enjoy good health to sing well, therefore take plenty of fresh air and walking exercise." Ill health, indeed, shows itself in the voice as promptly as in the face, and therefore comes properly under the head of "vocal faults."

What is called "a great musical movement" is going on in England. At a recent meeting in London, of the Association of Musical Competition Festivals, the fact was brought out that in about sixty districts in all parts of the kingdom musical competition festivals are held, and that their number is steadily increasing. There are drawbacks to the modern festivals—an occasional pot-hunting spirit and too much regard for winning medals and prizes—but the good far outweighs the bad.

When Gilbert and Sullivan parted company all lovers had cause to regret it deeply. The reason why they separated has not heretofore been known officially; but we know it now. W. S. Gilbert has recently written to the Dublin *Evening Herald* to correct various errors regarding himself contained in an article in that journal. He denied that he had prosecuted an organ-grinder for annoyance, and then applied for permission to appear as his counsel. He denied that he had ever spoken rudely to a member of his company. As for his collaborator, "the 'separation' was not between 'Gilbert and Sullivan,' but between myself and Mr. D'Oyly Carte. It arose from a question whether a sum of £1,500 for refurnishing the front of the Savoy Theatre was properly included in the preliminary expenses of the production of 'The Gondoliers.' I had no quarrel with Sir A. Sullivan, though a coolness existed between us for a time, in consequence of his declining to interfere in the difference between Mr. Carte and myself. This coolness lasted a very short time, and was quickly done away with by mutual expressions."

A report came from Bayreuth that Cosima Wagner does not feel well enough to continue any longer as the head of the festivals, and that her place will be taken by Siegfried Wagner. It is a simple fact that Cosima Wagner never was the proper person to preside over these festivals. Certainly Wagner himself never thought of her in that position. In a letter addressed to Angelo Neumann (manager of the Travelling Wagner Theatre, of which Seidl was the conductor), printed in his recently published "Reminiscences," Wagner says: "With 'Parsifal' my whole Bayreuth creation stands and falls. As a matter of course, that creation will pass away—it will come to an end when I die; for I do not know and cannot imagine who could perpetuate it according to my intentions." With the words *ist und bleibt mir unbekannt und unerkenntlich* (I do not know and cannot imagine) he deliberately emphasized the fact that he never had his wife in mind for this post—nor his son; and it must be remembered that these words were written less than a year before he died.

The other day there was at Padua a congress, presided over by the Patriarch of Venice, whose object was to obtain reform in sacred music. It was decided to promote the foundation of Scholae Cantorum, in which children should be instructed in sacred music, and to institute associations of musicians in various districts to form a sort of watch-committees to guard the music of the local churches. Next year there is to be at Rome a national congress, the object of which is to establish rules for deciding what is and what is not proper church music. The difficulty with such congresses is that their decisions are not compulsory in their own country, much less in other countries. At the Padua congress Verdi's Manzoni Requiem was sung as an example of real church music; but at Westminister Abbey, in London, this same work is considered too operatic, apparently, for liturgical use.

Art.

Houses and Gardens. By M. H. Baillie Scott. Quarto, pp. xvi, 247; 17 colored plates, 207 illustrations. Imported by Charles Scribner's Sons, New York. $12 net.

The charm of simplicity and straightforwardness in much of the domestic architecture of Great Britain has been noticed not only by travellers from America, but also by American architects at home. Quiet, unostentatious houses in suburban towns and country villages, half-timbered, slated or tiled, with prim little hedged gardens in front, full of quaint beauty, have been multiplied in recent years along British lanes and streets by architects of whom we hear, perhaps, but little, but who are doing a fine work in raising the general standard of taste in their special field. One of these architects, Mr. Baillie Scott of London, has given us, in this handsome volume, an entertaining series of short essays, more or less closely related, on the art of house-design as he conceives it. His "Houses and Gardens" will, on this side of the ocean, chiefly interest the architect and decorator rather than the general reader and house-owner. House architecture depends so closely upon national and local conditions, material and social, and reflects so directly the habits of life and manners and customs of a community, that treatises upon it written in and for one country are of little value to the people of another except in so far as they deal with fundamental principles. The American who reads Mr. Scott's book feels strongly the British character and color of the forty brief chapters; but it is this that really gives them their chief interest. Between their lines one reads conditions and ideals, so different from our own that they inevitably hold the attention by that very difference. Not everything, however, is different: again and again one's sympathy goes out to the English architect or house builder in his struggles, feelingly narrated in these essays, with unscrupulous contractors, bills of extras, smoky chimneys, and garden problems. These things have a familiar sound to the American.

Mr. Scott's book is a plea—straightforward, earnest, naïf at times—for deliverance from the dead monotony of philistine traditions in house building. He discusses the general problem in his first chapter, characterizing building in modern times as "not so much an art as a disease," and his criticisms and comments are generally sound. Perhaps our American public has advanced beyond the need of hearing reiterated some of the elementary ideas which Mr. Scott seeks to inculcate, though of that there may well be doubts. The succeeding chapters discuss the hall, dining-room, and other parts of the house; "the Soul of the house," furnishing, decoration, mottoes, color, pictures, and so on; the garden, ways and means; and finally, in succession, various types of houses, some of them—"terrace-houses," for example—quite unfamiliar on this side of the Atlantic. These discussions, extremely brief and dogmatic, at times tending to provoke dissent rather than to carry conviction, are evidently meant as expositions of the author's personal ideas, rather than as treatises from

the abstract point of view. The most interesting feature is naturally the illustrations. Certainly many of the interiors, charming as they appear in the drawings, would be but poorly suited to American habits and tastes; and much of the rather affected simplicity would seem to be of the expensive kind beyond the reach of the slender purses for which it professes to be designed. It is amusing to note, in the text accompanying plans for "a house in America," the remark that "American characteristics will be recognized in the ample cupboard space provided in the bedrooms": there are actually four closets in the five bedrooms! The exteriors are more uniformly satisfactory; and although quite as emphatically English, and quite as unsuited for this country, they are almost invariably charming by their dignity of line, restful treatment, and picturesque massing.

There is, on the whole, so much of good suggestion, of good taste, and of common sense in the book, that one easily overlooks minor deficiencies.

The July number of the *Burlington Magazine* has, on the whole, an unwontedly modern air about it, though there is a sprinkling of articles and plates dealing with older art. "The Case for Modern Painting" is continued, with a plate after a picture by Ambrose McEvoy, who seems to be doing in England, less well, what Tarbell is doing in this country—reviving, that is, the immortal traditions of the Dutch masters—while other relatively modern subjects are the photogravure frontispiece, after Corot's Evening on the Lake, and the picture in the Louvre called The Cottage, heretofore attributed to Constable, but now given to a little known painter, F. W. Watts, who is supposed to be the real author of many spurious Constables. A fairly successful color-plate after a portrait by Bartolommeo Veneto and half-tones after Chardin and Sir Nathaniel Bacon are among the more interesting illustrations. Dr. Rudolph F. Burckhardt indentifies one Hans Wydyz the elder as the author of certain sixteenth century carvings in boxwood of extraordinarily varied style and degree of merit; C. J. Holmes discusses the question "Where did Michelangelo Learn to Paint?" inclining to the belief that it was at Bologna and from a Ferrarese master; and Cyril Davenport endeavors to explain the real origin and meaning of "The Book Cyphers of Henri II." Articles on Roman campanili, Oriental ceramics and other subjects, together with the usual book reviews, help to make up an uncommonly interesting number. There is no section, this month, on art in America.

Carlo Gamba, in the *Rassegna d'Arte* for July, treats the work of the late Florentine eclectic Raffaello Carli, considerably extending the list of his works. Carli's best known painting is the highly Filippinesque Madonna, at Santo Spirito, Florence. Since he passed successively under the influence of Filippino, Lorenzo di Credi, Perugino, and Ghirlandaio, and his craftsmanship is of excellent quality, most of his paintings still go under these shining names. Accordingly Count Gamba's illustrated article will be useful to collectors of the prudent sort. One may note in the same number an account of the rearrangement of the Archæological Museum at Milan, and a discussion of a Visitation, a fragment of an altarpiece by Antonino Guiffré, in the Church of the Addolorata, Taormina. This obscure artist makes the third "Antonello da Messina," and the author, Enrico Brunelli, assures us that there were still others. Evidently this famous signature, even if genuine and of the fifteenth century, need not indicate the great Antonello.

The most important publication of 1907 for early Christian art is probably the reproduction of the illuminations of the Rossano codex, discovered in this little Calabrian town of Southern Italy and originally published by Gebhardt and Harnack. The outline illustrations which they gave were, however, quite useless for stylistic criticism, and the later plates of Haseloff were poor. Since the codex was fanatically guarded by its ignorant possessors there had never been a really adequate chance to study and reproduce this greatest work of the early Eastern illuminators, until the codex was sent last year to the exhibition of Byzantine art at Grottaferrata. The present edition, by Antonio Munoz (Rome: Danesi), is the first application of the chromophototype process to the reproduction of miniatures. The plates are of the exact size of the originals and absolutely photo-mechanical. The Greek text is that of the Gospels of Matthew and Mark written in letters of silver (and gold) on 188 sheets of purple parchment—the rarest and costliest of the ancient modes of writing. The illuminations make of this the earliest illustrated Gospel text. There are seventeen principal scenes besides many single figures. The text and the art alike point to Egypt and probably to Alexandria as the place of production; the date is the sixth century. The sketchy and often somewhat crude realism of the scenes is as far removed from the Latin art of the West as from the Hellenic purism of Justinian's Byzantine school. The editor has also reproduced the fragmentary purple Sinope codex in the Bibliothèque Nationale, Paris. It will be interesting to institute a careful comparison with the treatment of the same and similar Gospel scenes by the authors of the Roman Byzantine frescoes recently discovered and belonging to the same and the following century.

The same author, Munoz, publishes a volume on the recent exhibition of Byzantine art at Grottaferrata in 1905-06 ("L'Art byzantin à l'exposition de Grottaferrata," Rome: Danesi). This was the first adequate collection of really Byzantine objects ever gathered in the West, and it was quite fitting that it should be held in the Basilian monastery of Grottaferrata, which has upheld the Greek banner at the gates of Rome ever since its foundation by St. Nilus in about 1,000. The exhibition was also timely, because in Rome itself the discovery of the frescoes at S. Maria Antiqua and S. Saba had raised again with increased violence the discussion as to the part played by Byzantine art in Rome during the early middle ages. At the exhibition at Grottaferrata many hidden treasures were seen practically for the first time. Of course, the treasures of the Christian Museum at the Vatican were known to specialists, but the pieces sent from the monasteries of Nonantula, Monte Cassino, Rossano, from the private collections of Sterbini, Stroganoff, and Nelidoff, from Castell' Arquato, Gaeta, Cosenza, were practically unknown. Ivories, the small steatite reliefs peculiar to Byzantine art, wood sculpture of the most minute character, of later style, paintings on small panels, now generally thought to be much less early than was supposed, some few bronzes (especially the superb candelabra from S. Giorgio, Venice), the sacred vestments, illuminated manuscripts, and portable mosaic pictures, showed the manysidedness of Byzantine technique and a historic sequence of about one thousand years. The most complete series is that of the manuscripts, several of the most important and earliest being those of Monte Cassino and Grottaferrata itself. To one who visited the exhibition, the book of Munoz fails—not by any fault of its author—to convey one of the most interesting impressions, that given by the full-size facsimiles in color, of details of the early mosaics of Ravenna and Rome, which portray vividly the strength and realism of the mosaicists who produced the masterpieces of S. Maria Maggiore, of the Ravenna Baptistery and mausoleum of Galla Placidia, a realism that did not outlast the fifth century.

A book could be at once so good and so bad as Teodor de Wyeza's "Les Maîtres Italiens d'autrefois: écoles du nord" (Paris: Perrin et Cie.) only on the theory that the author had collected his journalism somewhat heedlessly. It abounds in the vaguest appreciations. Fra Angelico is a poet, and so, save the mark, is the pedestrian, Sano di Pietro. Fra Bartolommeo is a poet, and so is Giotto, whose quality, moreover, is "musical." Botticelli was an aimless experimentalist and a feeble technician until too late Savonarola awakened the dormant religious painter in him. Botticelli pleases because he has hit upon the British type of girlish beauty. This was due possibly to "some casual meeting with a model." In any case, his figures have "the same elongated features, the same large, sensual, and melancholy eyes, which attract us in the English painters from Gainsborough to Rossetti." Here we have M. de Wyeza at his worst. In the essays on Verrocchio (wisely skeptical as to recent reconstructions of his *œuvre*), on Mantegna, and on Tiepolo appear notable qualities of taste and historical insight. Throughout the interest is personal. Inferential crises are alleged to explain changes in an artist's manner. Gaudenzio Ferrari is sent beyond the Alps, Mantegna is dated by a new mistress. All this is suggestive and at times plausible, but it savors strongly of the capricious. The worst defect of the book is the very slight part the eye has had in its production. The author emotionalizes apparently before he has really seen. In all it is an ingenious work of ultra-literary type, and may safely be recommended to jaded readers of art criticism—if only as an irritant. For a beginner it would be not only useless but misleading.

From Charles Barmore of this city we have received two capital portraits of Abraham Lincoln and Mark Twain, etched on copper plate by Otto J. Schneider. The Lincoln (12x16, edition limited to 250 artist proofs) is from the photograph taken in

1864 by Gardner Bros., certainly one of the best of the portraits. The Mark Twain (16x22, edition limited to 250 artist proofs) was drawn from life with the assistance of Gessford's photograph. Both portraits may be recommended for framing. Mr. Barmore publishes a number of such etchings, chiefly of men famous in the law.

The death is announced of Just Becquet, the French sculptor, a pupil of Rude. A number of Becquet's statues have prominent places in Paris.

Finance.

CHANGING STANDARDS OF RAILWAY MAINTENANCE.

Whatever may be the notion of State and Federal authorities as to the basis of "value" in railway securities, there is but one basis, so far as the security markets are concerned, and that basis is income-producing capacity. The price of a security may be regarded as a resultant of three forces or factors—first, the rate of interest or dividend; second, the general rate of interest, and third, a more or less indefinite factor which, in the case of bonds, might be termed, as Carl Snyder in his book "American Railways as Investments" (Moody Corporation) terms it, the "factor of safety," and in the case of stocks the "equity." In other words, the price of a bond—the number of cents on the dollar of face value bid for it on the market—depends mainly on the rate of interest borne by it, the relation that this rate bears to the prevailing rate of interest, and the degree of security for its punctual payment. And the price of a stock depends mainly upon the dividend it pays, the relation of the dividend to the prevailing rates of interest, and the amount of potential dividend that the stock represents in the surplus earning capacity over the dividends paid.

Hence, the general scope of all processes of analysis designed to disclose the value of railway securities is principally confined to the question of earning capacity in relation to capitalization. For when a railway's true earning capacity is known the value of its securities is also known—the value, that is to say, regarded without reference to temporary speculative considerations. Mr. Snyder's book above referred to is the most recent publication on the subject of railway values; it is designed to put in the hands of the investor all the facts that he needs to determine more or less definitely the value of the stocks and bonds of American railways, and to furnish him with the fundamental rules for interpreting those facts. Barring a tendency towards perhaps unduly dogmatic statements and unduly definite conclusions—and no more than a tendency is to be imputed—the book seems likely to fulfil the purpose of its author. It is clear as to principles and, so far as a cursory test of the facts may disclose, accurate in its figures.

The chief interest of the book from the point of view of the economic student is its evidence of the extent to which standards are changing in railway practice, and, consequently of the extent to which these changes must be considered if railway values are to be accurately measured. The process of measurement consists simply of testing the "net earnings" as officially reported for "concealed equities" or the reverse. A railway in the United States is compelled by the Interstate Commerce Law to keep its accounts and make its reports in a form prescribed by the Commission. This form divides operating expenses into five general classes, three of which include all expenses of operation other than "maintenance," the remaining two including "maintenance of way" and "maintenance of equipment." In railway accounts the only possible place where "equities" can be "concealed" is in "maintenance," and consequently the test of net earnings is a test of "maintenance" charges.

Until within four or five years—during which the cost of labor and material used in railway work has increased and the general type of equipment changed—certain rough standards of maintenance charges per mile of road, per locomotive, and per car were in use among analysts seeking to determine "concealed equities" or the reverse in railway accounts. It was reckoned in a general way that a single-track road in the West, for example, with a freight density of, say, 600,000 ton-miles per mile of road per annum, could be sufficiently maintained for $900 or $1,000 "maintenance of way" per mile per annum, a locomotive for $1,000 to $1,500 per annum, a passenger car for $500 per annum, and a freight car for $50 per annum. If the maintenance accounts contained more than these allowances there were "concealed equities"; if less, the net earnings were overstated.

Mr. Snyder points out very opportunely that it is no longer safe to use these standards. He has (p. 66) a suggestive note on "Concealed Earnings," which runs as follows:

> The practice, therefore, of finding large concealed earnings through a comparison of maintenance charges, in 1906-7, with the scale of some six or seven years previous, is wholly misleading, and investors will exercise a healthy distrust of any such showings. It was the concurrent opinion of two operating officials, as expressed to the writer, that there were, save in rare instances, no concealed earnings in the maintenance accounts of 1906-7.

This fact—and it is surely a fact—may be commended to the notice of all who study railway figures for light upon values of securities. It is obviously impossible as yet to measure definitely the effect of changed costs and changed conditions upon these standards of maintenance, but it is probably safe to say that Mr. Snyder's estimate of a 50 per cent. increase is conservative. Some observers would be inclined to use an even higher basis than this. One analyst, of some experience, places equipment maintenance standards at present as high as $2,500 per locomotive, $1,000 per passenger car, and $80 per freight car as the smallest allowance that is safe for keeping numbers and capacity of equipment intact and in good order.

The Nation.

NEW YORK, THURSDAY, AUGUST 8, 1907.

The Week.

When Senator Bacon declares that tariff revision should be made the leading Democratic issue in next year's campaign, we are not surprised. But when ex-United States Treasurer Ellis H. Roberts, who for years had dwelt within the sanctuary, calmly suggests that Congress proceed at once to enact a flat reduction of 13 per cent. in revenue income, customs as well as internal taxation, it is time to sound the alarm. Mr. Roberts, in the *North American Review*, lays it down that a Treasury surplus of nearly ninety million dollars for the fiscal year just past, with the probability of an increase to one hundred and twenty millions in 1908, is an anomaly and a wrong, especially in times like the present, when the nation's industries feel the scarcity of money keenly. If the Government were as kind to its own citizens as it has shown itself generous to the Chinese, in remitting its share of the Boxer indemnity, it would not tax out of the American people, for the purpose of doing nothing at all with it, a sum one and a third as large as Italy's expenditure on her standing army. Therefore, urges Mr. Roberts, stop mulcting—that is the ugly word he uses—the country at once, cut a slice out of the national income until you are ready to revise your fiscal system thoroughly. Innocent Mr. Roberts, who thinks revision by a Republican Congress necessarily synonymous with revising *down!*

Mr. Bryan is plainly nettled at the reception which his retreat on the issue of Government ownership has met with from the Democratic press. He has angry things to say in the *Commoner* of "these editors." Why cannot they quietly accept his ratting, and have an harmonious campaign under his leadership? At any rate, he says, he is not going to allow them any longer to "dodge the issue of regulation." Thereupon he puts to them some ferocious questions. Are they for a "physical valuation" of the railroads? Are they, or are they not, against over-capitalization? Do they, or do they not, favor the reduction of rates? Well, if "these editors" have a grain of logic, they will tell Mr. Bryan that none of his questions goes to the main point. Whether they believe in regulation or not, they can see the absurdity of favoring a candidate who says that he does not believe in it, is certain that it will prove an abject failure, yet wishes to be elected on that issue! This is the terrible inconsistency of Mr. Bryan's position. He may not see it, but everybody else sees it; and it is this which, more than anything else just now, is causing such widespread doubt concerning the expediency of nominating him again. He himself plainly perceives this. Consequently he has allowed one of his Ohio followers to announce that Mr. Bryan "will not decline the nomination if tendered to him." But matters have now gone far beyond that. The nomination will have to be fought for—there will be no silver-platter business. It is the knowledge of this which makes Mr. Bryan so anxious and so waspish.

Who so perverse as the little brown Filipino? Here he is, after nine years of beneficent American rule, voting for the party of immediate independence, and doing it in the quietest and most orderly manner possible. Thirty-one Nationalists to nineteen of the other three parties—this is the result of the first election for the Assembly, so far as reported. The Progresistas, or Americanistas, elected only ten of their candidates. And this after hearing all of Mr. Taft's oratory, and after experiencing his friendly and democratic ways. The most obvious proof of unfitness for self-government is this refusal of the Filipinos to love us and to acknowledge our merits as a race of supermen. Do they see their industry crippled, their farmers barely recovering from years of war, pestilence, and starvation, and the loss of all their animals, yet have they not witnessed the stern, Puritan fortitude with which Congress has denied all appeals of Mr. Roosevelt or Mr. Taft to let down the tariff bars? How can they have any doubt that life under the Stars and Stripes is vastly better than any attempt they could make to govern themselves?

The Navy Department is now satisfied that the accident on the Georgia was caused by a "flareback"—that is, by burning particles from a previous charge blowing back through the gun upon the new charge about to be loaded. Curiously enough, the Navy Department regards this as a "welcome conclusion," on the ground that "flarebacks can be dealt with safely by additional precautions." To the mere layman this finding would seem to be reason for the Navy Department's putting on sackcloth and ashes and apologizing to the country. Flarebacks were responsible for the disaster on the Missouri, if not that on another ship; and after the former the Department bureaucrats solemnly assured the public that a device had been found which would prevent any recurrence of such discreditable disasters—discreditable because they do not occur in other navies. Now that valuable lives have again been sacrificed, the Department has appointed a board of officers to see what can be done to safeguard the turrets and prevent even more serious disasters because of the dropping of sparks after an accident from the turret into the magazines—a calamity narrowly avoided on the Georgia. Obviously, such an inquiry should have been instituted after the first disaster of this kind. But afterthought is the mark of the bureaucrat. It will make the public uneasy, too, to learn that the Navy Department has scrupulously concealed the fact that a gun of the Colorado blew its muzzle off two months ago.

The two comments most frequently heard in financial circles regarding the Steel Corporation's last statement of quarterly earnings are that the remarkable showing does not indicate even a moderate reaction in trade, and that the present common stock dividend is more than assured. The company's $45,503,705 net earnings for the quarter ending June 30 were in excess of any three-months' earnings in its history, running more than $5,000,000 beyond the corresponding quarter in 1906. After paying fixed charges and the 7 per cent. preferred stock dividend, and setting aside a substantial sum for depreciation, there was left from the quarter's earnings $24,538,000, or nearly 5 per cent. on the $508,000,000 common stock. It received, however, in dividends for the quarter, $2,541,000, or one-half of one per cent. Now, many, especially among investors in the common stock, are sure to ask impatiently why their dividends have not been made larger.

The answer may be obtained in the Steel Corporation's six years of history. Two lessons were learned during the "money squeeze" of 1903. That year proved unmistakably, for one thing, that earnings of a single month or quarter are an inadequate guide, even to the immediate future. The net earnings in June, 1903, exceeded by $772,000 those of the same month in 1902, and stood second on the entire list of the company's monthly earnings; yet the October net fell 40 per cent. below 1902. In November and December, less than half as much was earned as the year before, and in the first quarter of 1904, even the 7 per cent. preferred dividend was not earned by $1,857,000. A still sharper lesson in prudence was the serious embarrassment caused by the company's entry into the money market of 1903 as a heavy borrower. Of the $50,000,000 5 per cent. bonds offered by it at par, not a

dollar was taken by the shareholders, and the loan was saved from complete failure only because of a costly underwriting syndicate, which reluctantly paid up its guarantee for $20,000,000 of them. We do not recall these facts for the purpose of arguing that the present steel trade situation is identical with that of midsummer, 1903. There are important and reassuring points of difference. But the highly uncertain money market of the day is at least one point of close resemblance. Had the policy pursued in 1901 and 1902, of figuring closely on working capital in order to maintain high dividends, been pursued in 1906, the company would have stood to-day in a very awkward dilemma. It is confronted with no such embarrassment, and has as yet been in no respect entangled in this year's money market—a result for which the shareholders have to thank the management's more recent policy of low dividends on the common stock, and large cash appropriations each quarter to the general surplus.

Gov. Johnson of Minnesota appears to have acted, in the presence of the great strike in the iron-mining regions, as should a firm Executive set for the maintenance of law and order. His proclamation on Friday was a clear warning to the strikers that they must keep the peace. They have the right to assemble peaceably, and in this the Governor proposes to protect them; but they must avoid marching in large bodies near the mines, and renounce every form of physical intimidation and force. It seems to be admitted that Gov. Johnson's correct attitude has done much to make the strikers waver. Certainly, they have refrained, thus far, from violence. They appear to be aware that they have to deal with a Governor who possesses a backbone, and is not "afeared." But the whole adjustment looks suspiciously like a treaty between coordinate powers in the State. The unions stated what they would agree to do, the representative of the Governor laid down his terms, and a bargain was struck. If organized labor had its way, every State government would exist only on sufferance.

The use of the writ of injunction to prevent the erection of a $1,500,000 public electric light plant in Milwaukee will doubtless make that unpopular instrument, if possible, still more unpopular among a certain element. The proceedings are unusual in that it is not the injured private lighting company which stands in the way of the project, but the business men's associations of the city. To the Socialists, who are uncommonly strong in Milwaukee, the lighting plant was to be a monument to a great idea. Principle, not expediency, dictated its establishment. The business men of the city, however, are supported by the Comptroller in their contention that Milwaukee cannot possibly afford to build a lighting plant just now. If the money is raised for that purpose, there will be none for other improvements, and the city must go without sorely needed bridges, viaducts, and schools. The investment of so large a sum, even in an institution most useful in purpose, would be like the purchase of a grand piano by a family in need of clothes and food. It is the old conflict between a half-sentimental project and the realities of public finance and taxation. Milwaukee has a perfect right to skimp herself on any line of expense she chooses, and spend where she will, but we doubt if she has yet found a way of carrying out the Tittlebat Titmouse policy of "giving everybody everything without costing anybody anything."

The centralizing tendency of the age may possibly work a radical alteration in the methods of the Baptist denomination. Historically, each local congregation of Baptist believers has had the absolute right to settle all its affairs for itself. The various Baptist Associations are merely voluntary organizations of Baptist individuals, and always disclaim any power of any kind over any Baptist church. Baptist unity, it has been held, must be a spiritual unity, depending upon the acceptance of a few fundamental principles which have been assumed by Baptists to be plainly taught in the New Testament. But this is a day notably impatient of any theory which stands in the way of men who want to "do things," and so all over the country individual Baptists have been crying that the denomination must create some means of putting itself as a whole into positive and officially determined action. During the recent Baptist "anniversaries" this feeling found such outspoken expression as to lead to the provisional formation of a "Northern Baptist Convention." An appeal has since been made to a great many Baptist local "associations" to approve of that movement. Just what the scope of the organization is to be is as yet vague. Many of its promoters deny that it means any danger to the traditional independence of the local Baptist church; but if the Baptists go on to form a really representative body and endow it with power to act in the name of the denomination as a whole, no observer will fail to recognize a departure from historic Baptist usage. That the change, if completed, will give the denomination new efficiency, can hardly be denied. There is another side to the question, however. While denominations with machinery for unified action have been torn with heresy trials, the Baptists have escaped this experience, partly from the lack of any tribunal for dealing with a "heretic," except the local church to which he belonged. This has sometimes been awkward; but in real injury to the church it could not be equal to the trial for heresy of some such Baptist as the late President Harper, for instance, which would have been possible, if not highly probable, had the machinery for it existed.

Egyptologists, whom we would naturally accept as muckrakers almost by definition, have just exposed Rameses II. He was not a great king at all, it would appear, but, moved by "colossal vanity, and not content with the adulation of his own people, he arranged that posterity should take him at his own valuation. To this end he conceived the notion of causing his name to be inscribed on every temple, statue, and monument that he imagined would stand the test of time. Some of the antiquities on which his name appears must have existed quite one thousand years before he was born." All that can be said is that if Rameses II. was not a great king, he undoubtedly was a wise one. Not all of us have the power to hitch our wagon to a star, but what is to prevent a ruler from attaining immortality by chiselling his name into some primal virtue or undying truth that has existed long before he approves it and adopts it? The Seven Wise Men of Greece must have been aware that a truism would last longer than even one of Rameses's monuments. We can all follow their example by identifying ourselves with some such simple statement as, "There are in this world good men and bad men, heroes and cowards"; or "It is better that the race should survive than that it should perish"; or "The strong are not always the victors, nor the weak the defeated." Such maxims live forever.

Why should the vulgar rich be criticised for making a display of their wealth in extravagant living and ostentatious charity? It is no doubt true, as Mrs. Stokes said in her speech at Chautauqua, that envy and hatred are engendered by the frequent parade of luxury on the part of tawdry millionaires. Yet what would she have? If one is not flinging money about, how shall people know that he is rich? To give anonymously, would be ridiculous. Charity without *réclame* is an obsolete notion—as old as the New Testament. Besides, even the empty-headed rich must do something. Many of them have no other occupation than that of wasting their incomes in what Mrs. Stokes calls "idle and luxurious living." Invention has no greater triumphs than the various methods which have been devised of getting rid of one's surplus. One Pittsburgh connoisseur hit upon the

Oriental idea of investing his sooty millions in unset precious stones. These he carried about in his trouser pockets. Naturally, he could not resist the temptation of strewing them on the table of chance acquaintances. It would be uncharitable and cruel to deprive such rich men of the only pleasures which their limited minds are capable of conceiving. Mrs. Stokes would not take away from a child in the slums the piece of colored glass which its mates envy. On the same principle, she ought to leave ignorant plutocrats in undisturbed enjoyment of their monkey-dinners and their gold-plated bridle-chains.

Mr. Choate's speech at the Hague Congress last Thursday looks to saving the one valuable result which we may yet hope to get from that gathering. No agreement to respect the property of neutrals at sea, in time of war, will be reached. No plan of reducing armaments, it is now pretty plain, will be assented to. It is still possible, however, to unite in establishing a great and permanent court of arbitration. This was the burden of Mr. Choate's plea. In the spirit of Secretary Root's address at the Peace Conference in this city, he spoke of the importance of a dignified tribunal, composed of jurists of international weight, always ready to pass judicially upon any dispute between nations. There has already been a practical agreement to erect a prize court, made up of fifteen judges. This might easily be combined with a court of arbitration. Then we should have a representative and impartial body before which all international controversies could be laid—we may say, would surely be laid, for in a short time civilized opinion would tolerate no other course. Mr. Choate has apparently won over the support of the French and German delegates. The British cannot long lag behind. Hence there seems good prospect of obtaining one tangible outcome of all the war-talk at a peace conference.

An agreement between Great Britain and Russia would now seem to be a fact. While it is too early to attempt an estimate of the changes in international politics that must follow upon such an arrangement, it may be assumed that the peace of Europe will profit thereby. Germany cannot look upon this latest *entente* as another link in the chain supposedly forged by Great Britain to bind her, for the reason that an understanding between Russia and Great Britain cannot conceivably be more than an understanding. It would be extraordinary if Russia should so quickly forget the pain and humiliation of the war with Japan, for which she is not at all wrong in holding England partly responsible. An ally of Great Britain, therefore, she could scarcely become. Russia has merely come to recognize the results of defeat, and, faced by a tremendous internal crisis, has wisely decided to free herself, as much as possible, from foreign distractions. On the other hand, in view of the exceedingly vexatious condition of affairs in India, Great Britain should not be averse to arriving at some arrangement removing the ever-feared danger of an invasion across the northeastern frontier. After all, to call in Japanese troops to aid her against Russia in India would be a very desperate step. Allied to France, friendly to Great Britain, and in intimate relations with the German sovereign, Russia would be in a position to act as general intermediary, to the enhancement of her own somewhat fallen fortunes.

Every summer, when the Imperial yachts Polar Star and Standart, with the prisoner of Peterhof and Tsarköe Selo on board, breast the waves of the Baltic till the Imperial yacht Hohenzollern, bearing another distinguished personage, heaves into sight, European diplomats fall into great commotion. What is William II. now going to have his imperial cousin Nicholas do to his Russian subjects and to China, Japan, India, Persia, Morocco, and the Social Democrats? For it has become a tradition that these annual meetings on the Baltic are a sort of educational summer school, in which a weak-kneed autocrat sits at the feet of a strong-willed War Lord and departs instructed, strengthened, and refreshed. Does the Czar, as he pledges his guest in French champagne, entreat his fellow-monarch's aid and comfort? And does the Emperor, as he sits sipping German beer on board the Hohenzollern, lean over the table and pour hints on how to govern and remain alive into his visitor's ear? We doubt it. A cablegram declares that "the Czar is said to have visibly improved in appearance and spirits after his interview with the Kaiser." That might very well be, but there is no need of supposing that so marvellously sudden an improvement in the patient's condition—it would make the fortune of any patent medicine—was brought about by William II.'s solving all the Czar's problems for him while he waited. After all, the Kaiser has enough responsibilities of his own without being saddled with his neighbor's misdeeds. Moreover, there are, between Berlin and St. Petersburg, channels of diplomatic intercourse, a telegraph service, and even, it is said, a system of wireless communication. So why should the German monarch, in attempting to put his Imperial comrade up to mischief, do it after the approved fashion of comic-opera villains, in the full glare of the footlights?

There is an ignorance of the ways of the world that is actually pathetic in the public statements made by the Korean representatives now in this country. It is the same state of mind that characterizes the leaders of the patriotic party at Seul. Such facts as military conquest and such phrases as *de facto* and *force majeure* have no meaning to them. "If the civilized nations knew how the treaty of last November was obtained," said Prince Tjyong Yi, "they would not recognize it. It was obtained without the consent of the Emperor or the people." That is as though the French were to demand the restoration of Alsace and Lorraine, which were surrendered only because the Germans were at Metz, Sedan, and Paris; or the Filipinos should complain that they really did not want to be sold to the United States. The former Emperor constantly showed this almost childish capacity for overlooking the accomplished fact in his dealings with the Japanese, signing treaties one moment and forgetting in the next that the hand which held his nose to the grindstone once could do it again and again. Yet this very quality, if general among the people, may make Japan's task in Korea a difficult one.

The recrudescence of violence in Morocco may supply France with the long-awaited excuse for radical action, but it is as yet premature to speak of the Algeciras Convention as a failure. As a matter of fact, Casablanca is one of the eight coast towns for which the Algeciras agreement established a foreign-officered police force of some two thousand men. This force has not yet been organized, although the Swiss inspector-general, who is in supreme command, was reported to have arrived in Morocco months ago. At Casablanca it was provided that the commanding officers should be French and Spanish, a circumstance which may make it easy for France to take drastic measures without incurring German accusations of working for her sole interests. On the other hand, the occupation of another Moroccan town, after the example of Ujda, would arouse German mistrust. Ujda was seized as punishment for the murder of Dr. Mauchamp, at Marakesh, where the French authority could not make itself felt. But with Casablanca, where, as has been said, France holds a legal position, the case is different. Go ahead and preserve order, the nations might say to France. However, the difficulty of policing without a police force will probably result in international pressure being brought upon the Sultan, to hasten its organization. Italy and Spain, whose subjects were among those slain at Casablanca, will strengthen the hand of France, and a sudden turn in the Kaid McLean situation may set in motion an army, representative of all European powers, bound for Fez.

THE TAFT CANDIDACY.

The vote of the Ohio Republican Committee, last week, 15 to 6, undoubtedly puts Secretary Taft's Presidential candidacy in a forward and promising position. It is all very fine for Senator Foraker to declare that the action signifies nothing, is not technically "binding" on Ohio Republicans, and amounts to no more than the opinion of any chance gathering of twenty-one men. He knows better. Everybody knows better. When a candidate, opposed by the machine, is strong enough to wrest an endorsement from the creatures of the machine, it bespeaks a powerful sentiment in his favor. That is the true interpretation of the course of the State Committee. All unprejudiced observers will so take it. In spite of the protests and desperate efforts of the two United States Senators, their own underlings broke away from them and went for Taft. To deny that this is significant is to deny that the rising of the tide means a wetting for those who do not flee before it.

Out of pique and as a matter of form, Senator Foraker may keep up the fight on Taft. Of course, if he could divide the State delegation to the National Convention next year in the same proportion as he did the State Committee on Tuesday, the Taft candidacy would be hampered. If Foraker could muster 14 out of 46 delegates, he might be able to allege that Taft had not his own State behind him. But there is every likelihood that all opposition will soon be brushed away. On that day was the bursting of the dam, and the flood will now sweep on. It is not so much an irresistible enthusiasm for Taft that is at work in Ohio, as the growing hope that the State may be able to name another President. State pride is artfully played upon by the Taft managers; and if Ohio once becomes fired with the thought of recovering her old prestige in national politics, any man who gets in the way will be taking his life in his hands. One notorious "Ohio idee" is to stand together for the glory of the State. So there is little doubt that the Taft boom will sweep victoriously throughout the Buckeye State, and compel even the obdurate Foraker to make terms or be crushed.

The Ohio Republicans invite their fellows in "other States" to "coöperate" in securing the nomination of Mr. Taft. His qualifications are certainly worth serious consideration. No fair man can deny that he is of Presidential stature. He has uncommon ability, and an enormous power of sustained industry. His legal training has been supplemented by a wide range of practical experience in public affairs. In personal qualities, too, he has much to attract. He has a good deal of the blunt downrightness and courage of Grover Cleveland, with an added charm of good nature and affability. Commanding the respect of the serious, he is able to win also the liking of the generality. He is a hard worker, but also a good "mixer."

With such personal and political advantages, Mr. Taft suffers from one great handicap. We mean his patronizing by President Roosevelt. This is described as really a help to his candidacy. In some trifling respects it may be so; but in its total effect it is a misfortune for the Secretary. It makes him appear to exist by grace of another man. It is a sort of "Theodore Roosevelt presents." Taft is made to appear but the shadow of the President. Roosevelt points to him condescendingly as the candidate who will carry out "my policies." Taft has been treated as one especially set for the defence of the President, having neither voice nor mind of his own. This does him great injustice. He is not a man to brook dictation from any quarter. If elected President, he would indubitably be his own master. But a different impression has got abroad. It grows partly out of Mr. Taft's official position. This is an irksome and delicate one for a Presidential candidate. Loyalty to his chief tends to close his mouth. Having to take assignments to duty, he appears also to be taking political orders. And, as we say, the net result is that this burly man figures too much before the people as a weak dependent upon another. Nothing is more important for the successful urging of Mr. Taft's candidacy than that he should take steps to impress upon the country his independent merits, to show that he is not a mere echo of Roosevelt. To do this freely and effectively, it may be necessary for him to leave the Cabinet.

The Secretary is to make speeches soon, in Ohio and other States. The people will listen to him with sharpened attention. They will watch eagerly for evidence that he thinks and acts for himself. It is no secret that Mr. Roosevelt wants Taft to go to Ohio to "pitch into Foraker," especially to defend the President against the latter's charge of gross injustice in the matter of the colored troops. If the Secretary is wise, he will continue to refuse to do anything of the kind. Should he, on the contrary, see fit to say that a review of all the evidence has convinced him that innocent soldiers were wronged, it would do much to prove that his courage and love of justice are genuine. Of course, he could not do that and remain Secretary of War. But if he has to make a break with Roosevelt sooner or later, he could not find a better occasion.

In any case, Mr. Taft cannot well refuse to take up the challenge of both Senator Foraker and Mr. Bryan, that he define his position on the reform of the tariff. Here he already stands committed. His speech in Maine last year, announcing himself a believer in immediate tariff revision, was as bold in its way as his denunciation of Boss Cox in Ohio, or his plain speaking to the Southern Republicans, who are so for revenue only. Yet it may fairly be asked that he now clearly say whether he means to catch up the banner of tariff revision which President Roosevelt at first raised, and then threw away. As the open leader of the tariff-reform wing of his party, Mr. Taft would strongly appeal for the support of Independent Democrats. And if, while he is revising, he revises somewhat his views about the Philippines, and admits the existence in the islands of a powerful national sentiment, with which we are bound to put ourselves in harmony, and concede the Filipinos independence as soon as possible, he would be both strategically and morally in a strong position.

THE STANDARD'S TROUBLES.

"Gentlemen," said Matthew Arnold, when he appeared before the Income Tax Commissioners who had assessed his profits from literature at $5,000 a year—"gentlemen, you see before you what you have often heard of, an unpopular author." It is a plea *ad misericordiam* which the Standard Oil Company might well make. Fined $29,000,000 on Saturday, on Monday it is buffeted by another Government report, showing once more that it is an oppressive monopoly, forcing the people to pay exorbitant prices for a necessary of life. One good newspaper friend of the Standard hastened to allege that it could not pay a fine of $29,000,000 and "continue to do business." The unfeeling Commissioner of Corporations thereupon produces figures to prove that it has made net earnings of "at least $790,000,000" in the past twenty-four years, "and possibly much more." Quite a comfortable margin for incidental fines! Yet fines and adverse reports are not really so significant as the general rejoicing with which all such attacks upon the Standard are received. "Gentlemen, you see before you a highly unpopular Trust."

This fact, of course, makes it both easy and popular to attack the Standard. To take a kick at it has, for years, been the safe courage of insincere politicians. And now that a more serious legal pursuit of the Oil Trust is attempted, it is but fair to recognize the fact that judges and executives may be unconsciously swayed by the popular applause which they know will follow their efforts. If Judge Landis had not been fully aware that his decision of Saturday would at once reverberate around the world, carrying his name with it, and that grateful plaudits would arise from his countrymen, it is quite possible that he would have clipped a little the wings of his extra-judicial rhetoric. But such are the inevitable penalties of the unpopu-

larity which the Standard Oil Company has richly merited. It would be a thousand pities, however, if the fact that the Standard is now a dog at which any one may throw a stone with impunity, should lead to the slightest warping of legal process against it. A too severe decision set aside on appeal only leaves us worse off than before.

We cannot presume to say whether the Standard will win in the higher courts, but certain remarks about the decision of Judge Landis are obvious. The proceedings against the Standard were brought under the Elkins Act of 1903. Roosevelt's 1905 hook for the snout of leviathan was not used. This can but strengthen the position of such lawyers as Senator Foraker and Representative McCall. They contended from the first that the Elkins law was fully adequate to reach all cases of railway rebating, or the securing of unlawful rates by favored corporations, and that the Roosevelt measure was both confused and superfluous. Foraker has several times asserted that not a single prosecution had been brought under the act which the President moved heaven and earth to secure. The Ohio Senator has declared that the Elkins law is the only one that has "teeth." He may now point to the $29,000,000 fine as evidence that he was right.

Granting that the verdict of the jury against the Standard was well and truly found; that no vitiating error was committed in the trial of the case, there cannot be two minds, it seems to us, about the justice of applying the maximum penalty known to the law. The amount of the fine is tremendous, but it is inflicted upon a tremendous offender. It is no exaggeration to say, as Secretary Garfield is reported as saying on Monday, that the Standard has for years conducted itself as if it were above the law. It has snapped its fingers at the punishments laid down in the statutes. They were for the little fellows. The law would think twice before damning a corporation with such untold millions at command. Now, to have men of that kind of arrogance brought up with a round turn, is undoubtedly a good thing. It makes for social justice, and so for social content. It helps people to believe that the law is, after all, equal. Sensible men will believe that it is, in intent at least, even if Judge Landis should be reversed for error; though, of course, his reversal now would embitter many against the courts.

As for the report of the Commissioner of Corporations, it contains a mass of statistics which require much study. Hasty inferences from the figures should be avoided. Even the Standard Oil Company is entitled to its day in the newspapers, and on the stump, as well as in court. It seems somewhat unfair, for example, to point to the increase in the price of oil since 1900 as a sufficient proof of the exactions of a monopoly. The price of all commodities has notoriously advanced during that period. Oil prices should be taken with the rest. Much stronger is the case for the large and heightened "margin" between the cost of crude oil and refined, as detailed by the Commissioner. If he is correct in his figures, the excessive profit due to monopoly is clearly established.

THE GEORGIA DISFRANCHISEMENT

Close upon the heels of its drastic prohibition law, the Legislature of Georgia has passed an equally drastic disfranchisement bill, aimed at the negroes. The one is meant to be a measure of general social uplift, benefiting alike the untutored negro and the "poor white"; the other is to close the door of political hope in the faces of one million of its citizens upon whom Georgia largely depends for its labor, and therefore its prosperity and progress. In a republic based on political equality, the negroes of Georgia are henceforth to be ruled without a voice in their government, taxed without representation, and deprived of the most precious weapon for the preservation of political rights—the ballot.

Now, if Georgia had been for years past the scene of serious racial strife; if there had been frequent bloodshed over elections and constant public irritation over race conflicts at the ballot-box; or if certain communities were groaning under black misrule, there would perhaps be some excuse for this new law. As a matter of fact, the white man has for years had everything his own way in Georgia; no negro candidates have been in the field, and no white candidate has felt compelled to cater to the negro vote. The Republican party, to which the negroes have naturally belonged, has been at a low ebb; and therefore the inner ring of the Democratic party has had things entirely its own way. And yet the negro has been the convenient, or the only, issue. Let him be as law-abiding as you please; let him show you evidences of that extraordinary rise of his race within forty years—which so good a Southerner as Henry Watterson has described as one of the wonders of our times, or of any times—and he still cannot save himself from being the football of the politicians. He has submitted to disfranchisement in the hope that this would take him out of politics—but always in vain. Unless the railway issue is to relieve him for a while, he must continue to be the subject of such a Senatorial campaign as has just occurred in Mississippi, or of the recent gubernatorial contest in Georgia. He is the demagogue's most valuable asset, whether that demagogue be a man of culture and family, like Hoke Smith, or a boor of the Davis and Vardaman type.

Nevertheless, the negro has pushed his way upward undismayed, and some recent figures show that, whatever excuse the members of the Georgia Legislature have for disfranchising him, it cannot be one which bears upon his industrial progress. For instance, in 1866 the Georgia negroes owned but 10,000 acres of land; by 1876 they held 457,635 acres, and ten years later 802,939. In 1896 they had passed the million mark, and in 1906 they paid taxes on 1,400,000 acres that they owned outright, and on which they were assessed $7,000,200. Their stock had increased in value in the same forty years from $12,000 to $5,200,000; their city property had gone up from $70,000 to $5,850,000, while the value of their church and school property, from being $100,000, has now become $5,200,000. The assessed value of their property, exclusive of schools and churches, has grown since slavery from $450,000 to $23,216,468. This is the wealth they have created for themselves since they started out in rags and wholly illiterate, in 1865. What else they have contributed to the wealth of Georgia by the labor of their hands probably no man could estimate.

But now their reward for all this is a law which declares that they shall never have a voice in saying how the wealth they have created shall be administered or controlled by the State, which they support with their taxes. This law is patterned after those of other Southern States. Theoretically, any colored man who can read or write, or is intelligent enough to understand the use of the ballot, or who pays taxes on $500 or more, can register and vote. But to the election officers is given the discretion of deciding whether the applicant for registration has a "proper conception of his duty to his State or his nation." There is also the test of expounding a clause of the Federal or State Constitution, which has enabled low and worthless white registration officers to disfranchise many men greatly their superiors in knowledge, manners, and morals. Such hypocritical subterfuges are merely resorted to in order to preserve the fiction of Constitutionality. It would have been at least honest if a bill offered by a Mr. Payton had been adopted. That provided briefly for the disfranchisement of every person with one-eighth negro blood in his veins. But the result would have been practically the same.

Nothing startling will, of course, follow the adoption of this law. The negroes have not yet learned the value of unions, of organizations, of lawful agitation. The words general strike, or boycott, or the other terms that describe the ways inferior races, serfs, and oppressed peoples have found of making their masters uneasy in wrong, mean but little to them as yet. How will it

be fifty or a hundred years hence? None of these Georgia legislators, we venture to say, has thought of that; few can see beyond their noses, and still fewer know how to measure economic changes which occur right before their eyes. But that is when the test of the law will come. He who thinks that the negro will submit forever, unknowing of his strength, reckons without a knowledge of human nature. Only total enslavement, with the destroying of every colored school child's text-book that tells of 1776, could promise permanent subjection.

DISCONTENT IN GERMANY.

A pamphlet recently published in Berlin bears the significant title, "From the Land of the Discontented." The author, Herr Nissen-Meyer, is a retired lieutenant-colonel of the German army, who for three years commanded a detachment detailed for duty in China. Having returned from this foreign service, he has written a pessimistic, although not wholly unpatriotic, criticism of his native country and its people. He sees signs of deterioration in society, in the army, and the body politic. But he observes: "Only he who knows his faults can correct them." Two things, however, have impressed him favorably: one is the order which prevails in public life, and the other, the terse military way in which officials of all kinds impart information. Often politeness is wanting, but this is a matter of minor importance. He laments chiefly the number of restless and discontented persons whom he has met in all stations of life, but particularly among the working people. The Germans are neat, clean, and thrifty, but the party of the Extreme Left, the Social Democrats, is larger than in any other country of the world, being five times as great as in England and nearly twice as great as in France.

Col. Nissen-Meyer does not attribute this discontent to economic conditions. In Germany he finds a strong and bitter feeling of class against class—jealousy which no one takes the trouble to conceal. Even the well-to-do are dissatisfied, and a large number of them have cast in their lot with the Social Democracy. "How many are there," asks the author, "who think as these do, but are unwilling to express their opinions openly? Many things prove that the number of malcontents is by no means insignificant." For the depression of feeling is manifested not only in the demeanor and conversation of the people, but in the sinister tone of the press. The condition will probably become worse as time goes on, and Col. Nissen-Meyer fears that in contemporary Germany there are elements resembling those which wrought the disintegration of the old régime in France.

The causes of the evils which he has observed, he finds partly in the character of the German people, and partly in the system under which they live. For one who boasts that his point of view is cosmopolitan and impartial, he here shows himself strangely ignorant of the transplanted German the world over. For he traces the source of these defects to the mixture of German with foreign blood, and to the contact of Germans with alien races. This conclusion has been reached apparently in order to justify the author's bitter dislike of the German colonial system. The colonies have been badly administered, and are hated at home; so that Germans prefer to put themselves under a foreign flag when they emigrate. Yet the effects of foreign influence upon Germans, he declares to be bad; they become ostentatious and are given to strong drink. This is rather surprising information to Americans. Their observation is certainly different. Here is an example of the way in which this officer reasons:

> In Kioto I entered a Japanese inn with a friend. There were several rooms, in the last of which were seated several Europeans speaking English, as could be inferred from their loud conversation. So little was their behavior like that of Englishmen that I made a wager that they were of another nationality. Upon investigation it appeared that of the three, one was a Dane, while the others were born in the Rhine country.

Col. Nissen-Meyer speaks in high praise of the military establishment of his country, which he thinks is the one truly democratic institution to be found there. Yet he is distressed at the toadyism, the favoritism, and the bad manners which detract from its excellence. Too many promotions are made from among those in the Guards, while in the provincial posts there are all kinds of petty evils. For example: "Who does not know the Superman with nasal voice, the sabre-rattling Don Juan of the small garrison?" And here, most of all, we should be inclined to disagree with him. Elements of democracy the army has, but it is none the less the stronghold of the aristocracy. How can the army be considered democratic when few, however meritorious, can obtain an officer's commission in it?

It is unnecessary to follow this author as he expatiates upon what he considers the causes of national discontent. Such an exhibition of bitterness towards the institutions of the Empire would hardly deserve notice, were not this book one of many which prove, better than its arguments, that there is a deep-seated unrest throughout the German nation. It is, moreover, extraordinary to find this sentiment expressed in so exaggerated a manner by one who has held a commission in the army. Yet it may be that fact which blinds him to the truth that the national depression is so largely due to the burden of the great military establishment. The pamphlet cannot be accepted implicitly; yet it is a sign of the times, not to be ignored.

THE NEW PAPAL SYLLABUS.

Those who have read of the excitement caused in 1864 by the Syllabus of modern errors issued by Pius IX., must wonder a little at the indifference with which the similar "Decree of the Holy and Universal Inquisition," just put forth by Pius X., has been generally received. It has not been even thought worthy of cabling, except in bare summary. The full text, in French translation, was given in the Ultramontane organ, the Paris *Univers*. Pius IX. uttered his warning against "the audacities of modern thought." Pius X. directs himself particularly to the aberrations of exegetes of the Bible. His formidable list comprises no less than sixty-five "grave errors," some of which, it is said, are to be found, "deplorable" as it may seem, even in Catholic writers. Looking at the Pope's imposing array, one is inevitably reminded of Browning's

> Twenty-nine distinct damnations,
> One sure, if another fails.

No reader of the new Syllabus can fail to be struck by the way in which its guns are pointed astern. The Pope is aiming at conclusions of historical inquiry and Biblical higher criticism which are a very old story to Protestant theologians. All these questions about the admixture of human error in the Scriptures, the composite nature of some of the books of the Bible, the doubtful authenticity of others—in particular, the nature and date of the Gospel of John—have been fought over for years. Wide-awake theologians have, in fact, become rather weary of them, and have passed on to topics more alive. But here is the Holy See, through the Inquisition, thundering away at them as if Ewald and Wellhausen and Weizsäcker and Harnack had never lived, and Cheyne and Driver and Toy and Briggs had not yet written. The inference is pretty clear that Catholic faculties have not been able to steel themselves entirely against these investigations. Indeed, the Syllabus expressly states that the "errors" which it condemns are "more and more widely spreading among the faithful." It is to warn them in time, and to protect them against the unhappy consequences of an "alleged progress in doctrine," that the Holy Father, "on the advice of the very eminent and most reverend Cardinals,'" has judged it fitting to publish his list of proscribed errors.

Merely to give a few samples, No. XI. declares it a grievous error to hold that "inspiration does not extend to every book of the Bible, in a way to guar-

antee each in every part from all error." Error No. XV. is to maintain that "the Gospels were continually enlarged and corrected until they were definitely adopted in the Canon"; and, XVI., that "the narratives of St. John are not, properly speaking, history, but a mystical contemplation." Even "pragmatism" gets a blow in No. XXVI., where we learn that it is an error to believe that "dogmas are to be accepted solely for their practical effect on conduct, and not as a rule of faith." The very minutiæ of criticism are included, as in No. XXX., where it is laid down that the Biblical phrase, "Son of God," cannot be explained as meaning the Messiah. So it goes on through error No. LVII., "the Church is opposed to progress in the natural sciences," down to the final error of all, that "Catholicism cannot adjust itself to true science without becoming a Christianity without dogmas."

It is easy to see that the new Syllabus is directed against dangers already existing within the Church, not, as in the case of the Syllabus of Pius IX., against those pressing upon it from the outer world. That is one reason why the present document has fallen rather flat. It is not a denunciation of political doctrines; no fresh arraignment of Socialism; no repeated condemnation of "Americanism," in the Church. Such topics always create a stir, when Rome speaks about them. But since it is nice questions of Biblical exegesis merely, and the fine points of the higher criticism, the world will take but a languid interest even in an utterance by the Supreme Pontiff. The query has already been raised whether he now speaks *ex cathedra;* whether he lays down matters of doctrine which all good Catholics are hereafter bound to accept. A writer in the Paris *Figaro*, M. de Narfon, who is well known to have close relations with influential Catholic prelates, declares that the Papal infallibility is by no means involved, since Pius X. is simply pointing out errors, not defining doctrines. One can understand, however, the mild amazement of this Catholic writer, when he speaks of so remarkable an attempt, by mere decree of the Holy Office, to "solve most of the great controversies which exegetes and theologians have debated for years past."

It is, of course, the spirit of free inquiry in historical questions that affect former opinions about the Bible, which the Syllabus really condemns. It speaks frowningly of "historical arguments," and reproves those who set up any special claim for the "scientific exegesis" of the Old and New Testaments. Some complacent Protestants may plume themselves on this new proof, as they will call it, of Papal blindness and intolerance. But are they so sure that their own withers are unwrung? Archbishop Whately was keen enough to perceive that what we call Catholic tendencies are really grounded in human nature, and that Protestants share them in their own fashion. We are all exposed to the peril of wishing to suppress those who do not agree with us. Protestant churches do not face problems in all respects the same as the Catholic Church, but their method of meeting them has not been essentially different. They, too, have been known to be timid, short-sighted, and uncharitable in these very matters of Biblical criticism. Certainly, those Protestant denominations that cast out Robertson Smith and Professor Toy and Professor Briggs, ought not to be the first ones to throw a stone at the new Papal Syllabus.

SAINT-GAUDENS.

Saint-Gaudens's death brings no fuller recognition than had been shown in his lifetime of the fact that he was as fine an example of the pure artistic genius as America has yet produced. Medals have been given him at art exhibitions as in a class by himself; and they but expressed the opinion of the judicious. Curious analysts of the flower of genius have speculated on what he owed to his mixed French and Irish descent. Much, undoubtedly; but he owed more to the capacity for taking infinite pains.

The work of Saint-Gaudens marks in the history of American sculpture the definite breaking away from the spirit of classic imitation which till his time had dominated it. The revolt in Europe of such men as Barye, Rude, and Dubois, from the pseudo-classic ideals for which Canova and Thorwaldsen had stood, spread through Saint-Gaudens to America. He wholly departed from such of his predecessors as Greenough, Hiram Powers, Rinehart, and the rest of their school. But the break in the case of Saint-Gaudens was a gentle one; though definite and uncompromising, it was a revolt without violence. No American sculptor can be said to be more American than he. Whatever the effect of his foreign parentage, it gave him, with a special sensitiveness, a wholly sympathetic openness to the appeal and patriotism of the country that was his from his earliest infancy. Yet he expressed a perfectly American spirit in forms which owed little or nothing even to the sources from which American sculpture had hitherto drawn its inspiration. He found his historical affinities not in the abstraction of classic sculpture, but in the individualizing spirit of the Renaissance.

In range, Saint-Gaudens's work is extraordinarily wide, with the limitation that it contains scarcely any study of the nude. His Diana on the tower of the Madison Square Garden was designed to be seen from a distance, from which only the outline and pose have effect, and cannot be cited as an example of what his powers in the subtler problems of the modelling of the nude might have been. Outside of this limitation, his work, both in the round and in low relief, is comprehensive. It may be divided into three groups: his portrait plaques and medallions in low relief, such as his portraits of Dr. McCosh, Robert Louis Stevenson, the children of J. H. Schiff; his figures of an ideal character, such as the caryatids for the residence of Cornelius Vanderbilt, the Peace of God and the angels for the Smith tomb; and his monumental works in heroic portraiture, such as the Deacon Chapin and the statues of heroes of the civil war—Farragut, Lincoln, Gen. Logan, Robert Gould Shaw, and Gen. Sherman.

The technical perfection of his craftsmanship and the delicate strength and sweetness of his art are perhaps supremely illustrated in his portraits in low relief. No contemporary artist in that kind surpassed him in giving distinction and significance to the subtle refinement of modulated surface. The spirit of the Renaissance breathes in these portraits, both in the appreciation of the appropriate effects and in sympathetic characterization. They have always the charm, too, of an effect that is at once sculptural and picturesque. Of all his ideal figures, the so-called Peace of God is his masterpiece in symbolic expression. He attained in it to a mood of mysterious and tragic contemplation which places it among the greatest contemporary works of its kind. His angels for various tombs and his caryatids for the Vanderbilt residence do not approach this work in profundity; yet they have the distinction of a stately sweetness and an individual and lofty ideal of human loveliness.

Saint-Gaudens's work in heroic portraiture is in a sense his most important. In it he met and mastered technical problems on a large scale, and made it express to a degree unequalled in American art a noble and profoundly interpretative historical spirit. His Deacon Chapin is, of course, as, indeed, is his statue of Gov. Randall, an imaginary portrait. Yet his "Deacon" is at once the effigy of an individual and the symbol of a sect. It remains our greatest artistic expression of Puritanism. In his five great monuments to heroes of the Civil War, Saint-Gaudens faced the even more difficult problem of conveying through actual portraits of great men the spirit of the historical movement in which they lived and acted. With actual portraiture he faced, too, the problem of the artistic and heroic treatment of modern dress; and the masterly generalization which neither evades nor emphasizes the costume in the statue of Lincoln gives the measure of his success in this respect. The masterpiece of this group of Saint-Gaudens's

work is the equestrian statue of Sherman; and the Lincoln, though a less complicated artistic problem, can hardly be called second in simple directness and nobility of expression. These monuments of the Civil War epitomize the spirit of that struggle through single human figures dramatically, profoundly, and comprehensively, with complete freedom from anything like rhetoric or sentimentality, and with an energy of inspiration that makes it impossible to think of them with the thousands of banal statues to soldiers which take the joy of living out of our parks. The statue of Sherman is considered by a well-known artist and critic as the third greatest equestrian statue in the world. It seems extravagant to give it a rank next the Colleoni of Verrocchio and the Gattamelata of Donatello, but it is hard to think of a rival that better deserves the place.

Saint-Gaudens derived from the Renaissance, but in no imitative way. He appropriated the means and forms of the sculpture of that period because they lent themselves most completely to the expression of his special modern American spirit. He saw personalities and their historical significance from an individual point of view. He possessed nobility of imagination and perfection of technical equipment to a degree unrivalled among American sculptors. What he lacks, if one compares him with the greatest, is spontaneity. His manner, though without eccentricity—indeed, in regard to eccentricity, the leaning is the other way—impresses one as a learned, though completely individualized style, and one can detect the style at times apart from the subject. It is never quite free from self-consciousness—it adapts the subject to itself. But the style, with all its learning, is always consonant with the exalted spirit of the work. The self-consciousness is never the self-consciousness of rhetoric. No taint of affectation mars the nobility and simplicity, however evolved, of the appeal. The naturalness is thought out, but for all that it gives the most authentic, manly, and individual expression of noble themes that American sculpture possesses.

ROMAN ITALY IN THE NORTH.

II.—AOSTA.

There are few more fascinating valleys in Europe than the Val d'Aosta, the scene of the second stage in the game of strategy which Augustus was playing to bring peace to Northern Italy and to bind it to Transalpine lands, as outlined in my article in the *Nation* of May 30. Visiting this valley in midwinter for the first time, I expected to find it bleak and forbidding, leading up as it does to the very base of Mt. Blanc and Monte Rosa, but in the clear, still, and expanding atmosphere I could understand the apparent anomaly of the semi-tropical vegetation of the entire vine-clad valley, with its palms, its cacti, *fichi d'India*, rhododendrons, and so many of the same flowers that grow on the Riviera.

The Val d'Aosta stretches northwest for some sixty miles from the opening of the great Po valley at Ivrea, on either side of the river Dora Baltea. Even more than the Val di Susa above Turin does it give the impression of a long artery, often not two miles wide, leading into the very heart of the Alps. In the latter days of the Republic the valley was in the possession of the powerful and turbulent Salassi, a native tribe that commanded both of the passes bifurcating from the little amphitheatre where Aosta now stands: to the left the Little St. Bernard pass across the Graian Alps, and to the right the Great St. Bernard over the Pennine Alps. The Romans of the Republic had no use for either of these passes, and merely founded, in 100 B. C., the city of Eporedia (modern Ivrea), at the base of the mountain valley, to coerce the Salassi and prevent their raids on the great plain. That this remedy was hardly effectual, more than one punitive expedition attests. In any case it was not sufficient for Augustus, with his scheme to use the passes for his dreams of northern conquest and to communicate with the newly organized regions of Gaul above Provence. The special value of the Little St. Bernard was that it led, by the region of the Upper Isère and the Rhone, to Lyons, which Augustus made the administrative centre for all Gaul and which he aimed to develop into the greatest Roman city in the West outside of Italy. By the same pass the region of the Rhine could be reached somewhat circuitously. Soon also, in conjunction with the Brenner pass, further east, the Great St. Bernard was to be, not a source of danger to Italy, but a main artery of military communication in connection with the conquest of Rhaetia and Noricum; for it led to the region of the Phone, Lake Constance, the Aar valley, and the Rhine; and it was to serve the plans of the campaigns of Drusus.

In the Val di Susa the problem of Augustus had been simplified through the friendship for Rome of its confederated tribes. But in the Val d'Aosta, the more homogeneous and powerful Salassi were inveterate enemies; and so soon as Augustus had made the commercial route of Susa, further west, a part of the Roman network, he undertook, toward 25 B. C., their permanent subjugation. While he himself went to Spain and Gaul, he entrusted this minor but difficult affair to Terentius Varro, who resorted to a sort of Cuban *reconcentrado* policy, which enabled him to substitute a loyal population. It seems, in fact, a mistake to suppose, as even Mommsen has done, that Varro fought a pitched battle with the Salassi; rather, he left the lower end of the valley guarded, and worked his way up carefully to the summit until he reached the spot where Aosta now stands, where he established his camp. With the whole valley at his mercy and escape impossible, he organized a man-hunt. With a loss of less than two thousand killed of the Salassi, he coralled nearly 40,000 men, women, and children, took them to Eporedia and sold them all into slavery at public auction. On the site of his camp Varro then founded a Roman colony, Augusta Prætoria Salassorum; a city modelled strictly on the plan of a permanent camp, and, like Turin, built as a fortress. It was named after the Emperor and the 3,000 veterans of the Prætorian guard who were assigned to it with their families, as well as some of the native Salassi, who came in to join the colony and were spared.

Only recently an inscription found near the west gate flatly disproves Strabo's generally accepted statement that the Salassi were completely wiped out. It is a dedication to Augustus in 23 B C. of a statue (?) by "the Salassi who had joined the colony from its beginning." Local archæologists are mistaken in supposing the inscription to belong to the gate. Not only does its vertical shape disprove this, but the fact that this is a *private* dedication by a group of the inhabitants, whereas city gates cannot be dedicated except *publicly* by the whole city or the highest authorities. Therefore, before 23 B. C., the city of Aosta, with its walls, gates, and public monuments, must have been practically completed. It stands on a plateau, the upper end of which is a hemicycle outlined by the Alpine peaks, while the lower end had begun to broaden out near the modern Nûs. Immediately below it the streams Dora and Buthier meet, in front of the famous "triumphal" arch.

A few of the initiated know that Aosta is one of the best preserved Roman fortified cities in the world. It is a rectangle of the length of 2,440 feet, the normal maximum length of a Roman camp-city, according to Hyginus; its width is about 1,900 feet, which is wider than his norm (1,600 feet), but narrower than Turin. Its principal gateway, the Porta Prætoria, faces toward Rome; and in front of it, at a distance of 366 metres, stands the Colony Arch of the city. This arch is on the sacred *pomerium* line that encircled the walls at that distance, marking the *octroi* line, the boundary between country and city jurisdiction. The line was originally marked by a trench dug by the consecrating priest with his sacred plough and oxen, as soon as the ceremonies by which the centre and bounds of the new colony were determined had been concluded. No attempt has yet been made by scholars to determine the width of the sacred strip of land between walls and outer *pomerium*, within which it was forbidden to build. If I am right in placing the "triumphal" colony arches on this outer line, it will now be possible to determine this point in many cases, at Verona, for instance, at Gerasa in Syria, Thamugadi in North Africa, S. Rémy in Gaul, and Telmessos in Asia-Minor—to mention merely typical examples in different provinces of the Empire. The Aosta arch stands directly in front of the superb Augustan bridge across the Buthier. Even though the original level of the arch is some two metres below the modern road, and though it is shorn of all its upper section above the triglyphal frieze, the structure as it stands is, next to that of Orange in southern France, the most impressive of all Roman memorial arches. This is due not merely to its immense bulk, but to the perfection of its simple outlines and proportions, notwithstanding the fact that, unlike Orange, it is quite without decoration.

Besides the arch and the bridge, Aosta has the Porta Prætoria, the great stretch of encircling Augustan wall, with its towers, the ruins of the theatre, of the amphitheatre, the military granary, and the many

fragments of the Roman drains, streets, and houses. What is quite recent is the discovery of the existence of two lateral gates. Until this discovery it had been supposed that, contrary to general usage, Aosta had but two gates, at each end of the main thoroughfare, the *decumanus maximus*. One of these is the gate now standing, not far from the arch; the other, the Porta Decumana (west), still existed until 1808, when it was demolished. It opened out toward the Little St. Bernard. In the other two sides (north and south) of the rectangle at each end of the *cardo*, the main artery that intersected the *decumanus*, the two customary gates had not been traced, and this defect was explained on the supposition that when Aosta was built there was only the pass of the Little St. Bernard to consider, so that no gate was required in the north wall. Even Mommsen was misled into this fallacy, which is quite obvious as soon as we understand that what Augustus had in mind in the subjugation of the Salassi was precisely, in great part, the opening up of the Great St. Bernard in connection with his proposed conquest of Rhætia and Vindelicia.

The remains of the north and south gates have now been discovered, so that Aosta, like Turin, had four gates, but unlike Turin they varied in size, those on these minor faces having but a single archway, while the principal gates had three openings. This plan harmonized with the regular Augustan norm which gave a width of forty feet to the *decumanus* street and only 20 feet to the *cardo* street. Of the new gates, only the Porta Principalis dextera on the south side is comparatively well preserved up to a certain height. I was not able to visit its foundations, nor the little museum in the neighboring ancient tower, because the keys were, I was told, in Turin. Nobody wanted them in Aosta, it seemed, because the local inspector of antiquities had quarrelled with the Direzione in Turin, and the Aostan wortbies who had been offered the keys had all declined for fear of offending this inspector, whose influence was as strong as his temper was violent! Hence, I had to study the inscription in a cast at Turin, later on.

The Porta Prætoria is in its way as impressive as the Colony Arch, and, besides, it is unique in the perfection with which it preserves the plan of the Augustan military gateways. Like the rest of the gates and the walls, it is built, not of bricks like Turin, but of large blocks of stone. The flanking towers are not polygonal, as at Turin, but square, and project boldly beyond the walls. Both inner and outer façades of the gateway remain intact, enclosing the central court, into which, if the enemy should penetrate, he could be attacked on all sides by the garrison. It does not produce its full effect because the present street is two metres above the old level, and also because the gate has lost its upper story and its battlements, as well as most of the artistic facing with its architectural mouldings. But it still is almost oppressive in its impression of force and bulk.

Aosta was made by Augustus the capital of one of the three small military frontier provinces, just beyond the borders of Italy, into which the Emperor partitioned the Alpine range. His idea was to keep the territory under his own personal control, as military provinces, whereas Italy and other safe sections of the empire were under the civil rule of the Senate. This particular province was that of the Graian and Pennine Alps; the first province we studied (*Nation*, May 30), Susa, was that of the Cottian Alps. As Turin had corresponded to Susa, across the border, in Italy itself, so Eporedia, the modern Ivrea, corresponded to Aosta, some sixty miles distant. Eporedia was built on a hill where the river Dora swings out into the great plain, at the point where the main artery between Milan (Mediolanum), Pavia (Ticinum), and the Rhine and Danube meet the east-west trading route. Though it was not an Augustan foundation, having been established in 100 B. C., its nearness to the Salassi had prevented any great development until the time of the foundation of Aosta, about 25 B. C. Aside from remains of a theatre attributed to the Antonines, its Roman antiquities have disappeared, though there is little doubt that excavations would uncover the earliest military bulwark of the extreme north.

A. L. FROTHINGHAM.

NEWS FOR BIBLIOPHILES.

On July 26, Sotheby, Wilkinson & Hodge sold a number of books and relics of the Brontë sisters, the property of Mrs. Nicholls, the widow of the Rev. A. B. Nicholls, who first married Charlotte Brontë. Emily Brontë's Bible with inscription "To Emily Jane Brontë, by her affectionate Father, February 13, 1845," brought £15 15s.; three Hymn Books with autographs "C. Brontë, April 6, 1845," "E. J. Brontë," and "A. Brontë," £12 for the lot; two of Charlotte Brontë's school-books, with autographs and caricatures on covers, etc., £18 10s.; nine little volumes, six in the characteristic minute handwriting of Charlotte Brontë, the others being by her brother Patrick Branwell, £71 10s. These were specimens of the juvenile tales which the Brontë family amused themselves in writing. A similar manuscript, 49 pages in Charlotte's autograph, brought £22, and another, of 50 pages, containing poems, a portion of a diary, and "The African Queen's Lament," £45. The most interesting of the relics were Charlotte Brontë's writing desk (£25), her work box (£14 10s.), her paint box (£4 4s.).

The little volume, containing poems of the Brontë sisters, was issued in May, 1846, as "Poems by Currer, Ellis & Acton Bell," with the imprint of "Aylott & Jones." Shelley wrote to a friend about his "New Romance in Three Volumes," referring to "St. Irvyne or The Rosicrucian," which when printed made but one small volume of 236 pages. In the same way, after the volume of poems was in type, Charlotte Brontë wrote: "It appears the volume will be a thinner one than was calculated on." The book was an "author's book," and a draft for £31 10s., the amount of their estimate, was sent to the publishers before work was begun upon the printing. An error of £5 was made in the estimate, and Miss Brontë suggested that this additional amount might "be remitted when you send in your account at the end of the first six months." But they were unwilling to do this, having, perhaps, been made wise by past experience. A draft was sent a few days later. She wished "to have the work out as soon as possible," but desired that "it should be got up in a manner creditable to the publishers and agreeable to the authors." While she had faith in the printer's competency to correct errors, she thought best to have all proofs sent "because such a mistake, for instance, as *tumbling* stars, instead of *trembling*, would suffice to throw an air of absurdity over a whole poem." The publishers were instructed to have the book "done up in the style of Moxon's duodecimo edition of Wordsworth."

At first the authors decided to spend £2 in advertising, but this was afterwards increased to £12, leaving it with the publisher to select the periodicals. It had no sale; but the next year, 1847, "Jane Eyre" was published by Smith, Elder & Co., was favorably reviewed, and met with immediate success. The pile of unsold poems was thereupon transferred to the latter firm, who merely tore out the title-leaf which contained Aylott & Jones's imprint, and pasted a new one, bearing their own name, on its stub. Copies of the first issue are very rare, having sold at aution in England as high as £28, £21, and £19 5s. The only copy thus far sold at auction in this country is Mr. Dillman's, which, last March, sold for $125. Copies of the second issue, with Smith, Elder & Co.'s imprint, sell frequently at from $3 to $15.

The first edition of "Jane Eyre" is also a scarce book, especially in the original cloth covers. It was published the first week in October, it is said, and advertisements dated October, 1847, are bound at the back of the first volume. The second edition was issued in December. There was added to it a dedication to Thackeray and a preface, dated at end, December 21, 1847. The third edition has an additional "Note" dated April 13, 1848.

Correspondence.

THE ARTHURIAN ROMANCES.

TO THE EDITOR OF THE NATION:

SIR: I am much gratified by the good words in your review of my book, "The Arthur of the English Poets." I should not take up your time by a reply to such criticisms as I thought ill-founded, unless I believed some points of more than passing interest, be my critic's view of my book what it may.

The book, as I state in the preface, was intended chiefly for readers who might desire some knowledge of the Arthurian legends without delving too deeply into mediæval literature. Hence, it was my object to avoid, as far as possible, the discussion of scholastic conjectures, or a maze of minutiæ. I do not plead guilty to having overlooked most of the "errors" that my critic somewhat captiously calls attention to. For instance, the relation of the two versions of the "Quête du St. Graal" is stated explicitly in the pages of Gaston Paris, referred to in a foot-note. As for Mordred's incestuous birth, I have preferred in a foot-note to accept the opinion of Professor Rhys, rather than that of Gaston Paris, which my critic favors. No less an authority than Professor Thurneysen has

suggested the opinion which I have developed that Arthur belonged not to the Romanized Britons, but to an antagonistic patriot party. More than one eminent Celtic scholar holds the opinion which I have accepted about the value of "The Lay of the Great Fool," in a discussion of mediæval Grail legends. The fact that Professor Zimmer, in his review of Mr. Nutt's "Holy Grail," pointed out that this tale ("The Great Fool") first appears (*i. e.*, in literary form) in an eighteenth century Irish manuscript, next to a version of Chrétien's "Yvain" called forth from Mr. Nutt a reiteration of his original view. A foot-note of mine says distinctly that Malory did not invent the part which the Archbishop of Canterbury plays, or Guinevere's excuse to escape marriage with Mordred. And another calls attention to certain pages of Miss Weston's "Legend of Sir Lancelot du Lac," where will be found an extreme opinion of Malory's unoriginality.

More interesting to me, however, and perhaps to all your readers, is the relation of Malory to his sources. So far as Miss Weston, and apparently my critic, go in making him unoriginal, I am not yet prepared to go. Whether Malory used several French texts from which he abridged and compiled his work, or only one French text in which abridgment and compilation were virtually done for him, I think that he was not always slavishly following his "French book." For each part of his work the French text, which was his main source, may have been modified by other French, or in some instances by English texts. This might be the case in any book; certainly it seems to be so in the last book, which I believe to have been modified by the English stanzaic "Morte Arthur." True, its influence is not strong, but that it did to some extent modify Malory's phrasing I feel as sure as one can be of what has not been proved. I cannot agree, as my critic does, with the opinion of Prof. J. Douglas Bruce, expressed in his introduction to the Early English Text Society's edition of the poem, and more fully in Vol. 23 of *Anglia;* "The similarities and occasional coincidences of phraseology which one observes in comparing Malory and the Middle English metrical romance are only such as will occur where two writers are following closely the same original." Even though Prof. W. E. Mead has expressed the same opinion in his "Selections from Morte D'Arthur" (Boston, 1897), I must dissent from it. The examples which he cites of similarity in phrasing between the metrical Merlin and the prose Merlin of the fifteenth century, romances independent of each other, seem to me not so striking as the examples which he himself cites, and which Dr. Sommer had previously cited, of similarity between Malory and the stanzaic "Morte Arthur." Compare the way Malory makes Guinevere address Lancelot at parting from him:

> I require thee and beseech thee heartily, for all the love that ever was betwixt us, that thou never see me more in the visage; and I command thee on God's behalf, that thou forsake my company, and to thy kingdom thou turn again and keep well thy realm from war and wrack,

with the poem,

> There-fore, syr lancelot du lake,
> For my loue now I the pray,
> My company thow Aye for-sake
> And to thy kingdome thow take thy way;
> And kepe thy Reme from were and wrake,

Though "war and wrack" may be a common mediæval formula, does it not mean something, even making allowance for Malory's very sensitive ear for rhythm, that kingdom and realm stand in the same relative position in his work and in the poem? Then when Malory's Arthur questions Bedivere after bidding him throw Excalibur into the water, he says:

> "What saw thou there?" said the king. "Sir," he said, "I saw nothing but the waters wap and the waves wan."

In the poem we have:

> "What saw thou there?" than sayd the kynge,
> "Telle me now, yif thou can."
> "Sertes, syr," he sayd, "nothynge
> "But watres depe And wawes wanne."

And the end of the story of the passing of Arthur, as related in verse, is:

> All night he went wepynge sore;
> A-gaynste the day he fownde ther wrought
> A chapelle by-twene ij holtes hore.

Malory says that Sir Bedivere weeping and wailing "took the forest, and so he went all that night, and in the morning he was ware betwixt two holts hore of a chapel and an hermitage." According to Professor Bruce, the French original of both Malory and the English poem was pretty close to the following passage in the Vulgate-Lancelot:

> Al matin li auint quil troua vne montaigne plaine de reces ou il auoit .j. hermitage asses loig de toutes gens. Il torne cele part son frain et pensa quil iroit veoir cel lieu por sauoir qui i repaire. Si va tant contremont le sentier quil est venus el lieu la li hermitages estoit qui estoit asses poures, si i auoit vne chapele petite et anchiene.

To me it is hardly credible that two English authors working quite independently, one in verse, the other in prose, and belonging to two different generations, should have rendered a passage much resembling this with remarkable similarity of phrase though departing so far from the supposed original.

It seems to me then that Malory, besides using the French romance which was the principal source for the last book of his "Morte D'Arthur," used to some extent at least one other work, the English poem, "Morte Arthur." If this is so, why may we not also suppose in his earlier books the slight originality of selection which I have been inclined to accord him?

HOWARD MAYNADIER.

Boston, July 8, 1907.

[In our criticisms of points in Professor Maynadier's book—of which, on the whole, we expressed a very favorable judgment—we, of course, simply took the text of the book as we found it. For instance, Professor Maynadier himself does not mention the two forms of the "Quête," whatever Gaston Paris may do. It does not seem to us that the general reader ought to be left to stumble on this in reading other books, for the reference to G. Paris relates merely to the date of the Vulgate-Quest. As regards the incestuous birth of Mordred, leaving out of question the relative merits of the two theories—the one a far-fetched explanation from Celtic mythology, the other assuming merely contamination with the widespread *vergogna* theme—surely the views of G. Paris on a question of such importance as this ought not to be passed over in silence. As to the next point, there is no way of proving anything about it, but the name being practically the only evidence, it seems to us that it ought to be given due weight. With regard to the "Lay of the Great Fool," as an independent variant of the Perceval story, if Professor Maynadier will look up Mr. Nutt's Report on "Celtic Myth and Saga," in *Folk-lore* III., 401 f., he will find that Mr. Nutt himself there gives up this theory—"for the present, at least"—and sets forth his reasons for doing so. In the next place Professor Maynadier insists on Malory's Anglicization of his sources. In his footnote he merely qualifies this by saying: "Both this excuse and the bishop of Canterbury's hostility to Mordred appear in the octosyllabic 'Morte Arthur,' but without seeming so real as Malory." These points, however—themselves taken, as will be observed, from an English poem—are only a part of the Anglicization claimed by Professor Maynadier. The comparison of Guinevere's conduct with that of Margaret of Anjou, indeed, comes in the text after the passage to which the footnote refers. The question of Malory's relations to the stanzaic "Morte Arthur" is too big a one to take up here. We merely have space to remark that when two men are paraphrasing the same original in the same language it would be little short of miraculous if their work did not show coincidences of phraseology. The coincident phrases in this case being among the commonest formulas in Middle English, we do not believe that they possess any force.—ED. NATION.]

APPRENTICESHIP.

TO THE EDITOR OF THE NATION:

SIR: The National Institution of Apprenticeship of England referred to in your notes of July 18 has to do with a subject of great importance, which of late has become of widespread interest, particularly in England and the United States. The decadence of the system of apprenticeship of former times has resulted in a great dearth of skilled labor, felt in all branches of manufacturing. To meet this need this institution is perhaps one of the best of the many movements that have been started either here or in England, for the reason that it takes existing conditions and applies a remedy that will produce effects in the shortest time practicable. But, on account of the changed nature of modern manufacture, it will be too limited in its effect to produce fully the desired results. The modern plant is so costly, making fixed charges so high, that, imperatively, it must be worked to its maximum all the time. Hence the growing practice of working it both day and night, with two or three relays of workmen. It is obvious that the percentage of labor cost is less, and the fixed charges cost greater than under former conditions. This accounts mainly for the decadence of the apprenticeship system. It does not pay to allow an inefficient hand, however low his wages, to operate a costly piece of machinery. It is much better to pay wages sufficiently high to secure maximum output. Hence, the movement referred to must be limited in its effect because comparatively few apprentices can be employed. It is within the knowledge of the writer that boys above the average in brightness when under *competent instructors* will learn *very rapidly*. Perhaps the

best system as yet in vogue is that adopted by several of our large works, that of having an independent department with competent instructors exclusively devoted to training apprentices. It has been found under these conditions that for a term of four years the employment of apprentices can be made reasonably profitable. The losses of the early period are made up by the gains in the later period. Perhaps the most interesting development of this subject of late years is the action taken by some of our State authorities, notably Massachusetts. The aim is to extend the public school instruction to the industrial arts with such a thoroughness that each student who completes the course, or even partially completes it, will be far better fitted for self-support and the duties of citizenship than can possibly be the case with courses as now established. The movement referred to is far in advance of the mere manual training now so much in vogue. It is the boast of those who advocate manual training that its object is to train and cultivate the mind, that the mechanical skill acquired is simply incidental, a by-product of the mental training, whereas the new movement aims to make the mechanical training immediately effective for the material betterment of the student and State. To produce better citizens is the justification for the expenditure of public money, as proposed in the new movement in Massachusetts.

STEPHEN W. BALDWIN.

Breadloaf, Vt., July 25.

TRAINING FOR CURATORS.

To the Editor of The Nation:

Sir: Permit me to answer your query, "Why such schools of archæology as those of Athens and Rome should not undertake" the work of training students to become curators in our museums. At least one of these schools does do so. From my first connection with the School at Rome, some ten years ago, I have urged, both in private conversation and in my published reports, the advisability of offering training for museum positions to our students. But several of the members of the managing committee were of opinion that, since the school had been founded as a school of classical studies, nothing but what immediately related to those studies should be taught there. By degrees, however, the general curriculum of the School has become very much broader than the founders of the School at first deemed possible. It embraces those branches of archæology and the fine arts from the pre-classic through the Renaissance periods which are the necessary foundation of the knowledge requisite for any curator, and for several years past the charge of museums or of a department in one has been held up to the students as a prize quite as well worth striving for as most professorships. The numerous museums in Italy made it possible to teach art and archæology as can be done in no other country, and also made easy the discussion of arrangement and lighting, or the methods of cataloguing. Furthermore, the small but constantly growing museum belonging to the school itself gave actual practice to those students whose tastes led them to these studies, in discrimination and cataloguing.

We were told that this work could not be done, the chief reason given being that it had not been done before. However, as Leonardo says, those that appeal to authority use their memories, not their intellects; and I can say of the work, that it has gone steadily on.

The association with trained connoisseurs suggested in your article has also been for several years one of the chief opportunities offered our students, and one they have eagerly welcomed. What we need to carry out this special work as well as the other work of the School, is money. One volume of papers, of which several have to do with museum subjects, has already been issued, but two more are held up for want of funds to print them.

I trust this is a satisfactory answer to your query. What is lacking seems to me to be something different. Until a larger proportion than at present of the members of the governing boards of our museums recognize the character of the training given at the Schools of Rome and Athens and the work of the students, as compared with the better advertised work of foreigners, the graduates of our schools can have but little hope of being valued at their true worth. When that day comes, the time-wasting discussions of the æsthetic or archæological method of museum arrangement will no longer be heard, and the public will find that museums accomplish something more than the mere storing of private collections.

RICHARD NORTON,
Late Director of the School at Rome.

Ashfield, Mass., July 22.

BIBLIOGRAPHY OF AMERICAN HISTORY.

To the Editor of The Nation:

Sir: It may be of interest to your readers to know that early in 1908 a bibliography is likely to be brought out under the title "Writings on American History, 1906," which will cover books, pamphlets, and articles upon the subject having any value, on substantially the same plan as "Writings on American History, 1903," edited by Prof. A. C. McLaughlin and published in 1905 by the Carnegie Institution of Washington. The series not having been continued by that institution, the present endeavor rests for pecuniary support upon a group of historical societies and interested individuals, who have guaranteed for five years a sum sufficient to produce an annual volume. It is intended that the volumes for 1907 and subsequent years shall be issued as soon as possible after the termination of the calendar year. The gap represented by productions of the years 1904 and 1905 is left to be filled later.

J. F. JAMESON.

Washington, D. C., August 2.

Notes.

A new volume of Dr. Furness's Variorum Shakespeare, "Antony and Cleopatra," is announced for immediate publication by the J. B. Lippincott Co.

Thomas Y. Crowell & Co. have in preparation a book on "The Japanese Nation in Evolution," by Dr. William E. Griffis.

Early in September A. C. McClurg & Co. will issue a work in three volumes on "The Campaign of Santiago de Cuba," by Col. H. H. Sargent, U. S. A. It is a full strategic history of the campaign, with maps.

To the Muses' Library (E. P. Dutton & Co.) is to be added a volume containing the Poetical Works of George Darley, with an Introduction by Ramsay Colles.

Anatole France's "Jeanne d'Arc" is to appear early in September. He is now reading the proofs.

Prof. Joseph Bédier, of the Collège de France, will soon have ready "Les Légendes épiques," studies of the origin and formation of the *chansons de geste*.

Readers of Robert Hichens's novels who have puzzled over the name will be glad to know on authority that it is pronounced not Hyckens or Hickens, but simply Hitchens.

It is proposed to erect a memorial to Mrs. Oliphant in St. Giles's Cathedral, Edinburgh. The appeal for subscriptions says that she "holds honorable rank among the writers of the Victorian era as probably the most distinguished Scotswoman of letters the country has produced. In her private life she was essentially one of the 'great ladies,' great in her example, great alike in her joys and in her sorrows." An influential committee has been formed to promote this object, among whose members are Mr. Balfour, Lord Rosebery, Mrs. Humphry Ward, George Meredith, J. M. Barrie, A. H. Hawkins ("Anthony Hope"), William Blackwood, and many leading publishing firms or their representatives.

Prof. Joseph Alexander Leighton of Hobart College, who has in preparation a treatise on "Personality and Reality," has issued an essay on "Jesus Christ and the Civilization of To-day" (Macmillans), in which he seeks to present the ethical teachings of the founder of Christianity in their bearing upon the problems of modern culture. His aim is to "discover the fundamental ethical needs of contemporary life, to determine by what principles of conduct the spiritual nature of man and of civilization may be best preserved and developed," and, further, to "determine the bearings of Jesus' ethical teaching on this spiritual life of to-day." To the peril of enslavement in physical causation he opposes the Galilean teaching of the freedom and worth of the individual, and over against the danger of practical materialism, with its interpretation of life as a struggle for sensuous and superficial goods, he erects the high personal idealism of the New Testament. Professor Leighton would seem to be more at home in the field of ethics than in matters of New Testament criticism. One can but wish him well in his doctrine of the freedom of the individual and victory over the forces of time, but it must be said that a more critical attitude toward early Christian tradition would have added not a little to the soundness of his results.

After searching for half a century in Arabia, East India, and elsewhere for the Biblical gold land of Ophir, modern scholarship, as represented in the archæological and historical researches of Karl Peters, had settled upon South Africa, along the Zambesi particularly, as the site of mines where Solomon and Hiram secured their precious metals. These results were based chiefly upon the discovery of old ruins and remains of old mines in these parts of

Rhodesia. Now this discovery is seemingly being shown to be a dream by Dr. David Randall MacIver, in his "Mediæval Rhodesia." He finds nothing of Semitic or Egyptian origin, but thinks all these mines must have been the product of the Middle Ages. The author maintains that in these parts there must have existed some time during the Middle Ages natives of Africa vastly superior in culture and civilization to anything found there in recent centuries. The Germans have already taken up this new line of investigation, and the *Christliche Welt* of Tübingen, No. 24 after analyzing the Egyptian and local archæological reasons for finding Ophir in South Africa, comes to the conlusion that, in view of the facts furnished by Dr. MacIver, the deliberate judgment of scholars must still continue to be an "ignoramus."

Just why it was necessary to make a book of "Indian Pictures and Problems" (E. P. Dutton & Co.) is not evident. Our hands are full of such reprints already. Ian Malcolm made a visit to India and wrote about it to various English newspapers. There was no harm in that, though he might have stopped to consider how many other tourists had done the same thing better. But when it came to publishing these notes and impressions, and binding them up with a lot of photographs for sale all over India, he should have paused a long time. However, if there is nothing quotable in Mr. Malcolm's journalistic attempt to do India, there is also nothing objectionable. A child may read it and rejoice. An adult will probably think that he has read it all before.

The motto of Mrs. Mary Mead Clark's "A Corner of India" (Philadelphia: American Baptist Publication Society) is

> To see the savage bow in prayer
> Is my supreme delight,

and those whose nature permits them to echo this ingenuous avowal will find unqualified joy in the perusal of the author's tale of life among the war-like Nagas on the northeastern frontier of India. It is a simple story of life-long devotion to the missionary cause, ending with a hopeful, if somewhat meagre, outlook. The savages who here bow in prayer are few in number, and even the best are still ignorant, and but little removed from barbarism. Still, it is something to turn a few head-hunters from their unpleasant occupation, even if there is a canny sense of material advantage in the fervor of the newly converted. Mrs. Clark's account gains much by its lack of pretence to literary style. An unfortunate simile likens the "flames of burning villages" to "tongues of fire," but in general the reader, even if not sharing the writer's "supreme delight," is sure to be impressed by Mrs. Clark's unaffected and earnest narrative. And one fact is clearly brought out. A single missionary to savages accomplishes far more than a dozen sent to civilized lands. If only the missionaries in the heart of India could all—or most of them—be transferred to the frontier, how useful they might become!

The Outing Company offers a nicely printed little volume by Louis Rhead, on "Bait Angling for Common Fishes." One is somewhat surprised to find the brook trout included in this category. The author's justification is that it is sometimes caught by bait angling on the bottom, just as other common fishes, but the black bass might just as well have been included for the same reason. The present writer's best record for small-mouthed bass happens to have been made in just that way, in about twenty feet of water. In general it is well to find a recognized authority on trout and bass angling as willing as Mr. Rhead to recognize that there may be legitimate sport in angling for the humbler varieties of fish, and even in the use of the worm; but is it really necessary that the line of toleration should include the carp, that swinish guzzler of the spawn of really respectable fish? We imagine that few who have ever seen the devastations of carp in previously good bass waters can think of the introduction of the carp without much the same sentiment as is aroused by the thought of the importation of the gypsy moth or the English sparrow. We have never been able to recognize the amount of game quality which he finds in the striped perch, but we quite agree with him in condemning Robert B. Roosevelt's assertion that its flesh is coarse and tasteless. When skilfully fried to a crisp in fresh butter, there are few normal palates to which it will not make a successful appeal. Personal experience with the great Northern pike leads us to question the author's statement that no branch of the Esox family is given to assembling in schools. Mr. Rhead closes with a quite common accompaniment of angling literature in these days—a denial of the essential cruelty of angling. We do not think that the sport of angling itself can ever be seriously endangered by attacks on that score, but the attacks doubtless have a useful function in quickening the consciences of individual anglers.

T. Herbert Warren's "Magdalen College, Oxford" (E. P. Dutton & Co.), one of a series, is written by the president of the college in a gossiping style. It contains as much local history as the general public is likely to desire, and some interesting notes on the Customs and Worthies of Magdalen. Of its most famous custom, the May Morning singing on the Tower, President Warren remarks that the solemn character imparted to the ceremony by the use of the hymn taken from the College Grace is not older than the end of the eighteenth century. Before that it is described as "a merry concert of both Vocal and Instrumental Music, consisting of several merry Ketches, and lasting about 2 hours." Antony Wood alludes to it as an "ancient custom," and says that the object was "to acknowledge the coming in of the fruits of the year, or (as wee may say) to salute the great goddess Flora, and to attribute her all prais with dancing and music." The modern celebration makes up in grave, but not unpicturesque, formality what it has lost in meaning.

There can be no question but that the "Commentary on the Gospel of Matthew" of the International Critical Commentary Series, by Willoughby C. Allen, Fellow of Exeter College, Oxford, will take its place at once as the best work available in English (Charles Scribner's Sons). The book is written for "the student who desires to have some understanding of the growth and development of the Gospel literature in the first century A.D., and of the meaning which this particular Gospel had for the evangelist and his first readers." The chief merit of the commentary is its painstaking and sympathetic interpretation of the Greek text, without improving observations or wearisome cataloguing of discarded opinions. While the author has striven to preserve the distinction between the sphere of the commentator and that of the historian, questions of credibility and theological implication are not entirely avoided, his attitude being for the most part conservative. Especially praiseworthy is his scholarly analysis of the sources of the Gospel, among which he assigns chief place to the canonical Mark, finding evidence also of a source or sources common to Luke and Matthew, as well as distinctively Matthæan Logia, and independent "Palestinian traditions." These sources are indicated by initial letters in the margin of the commentary. Mr. Allen would be the last to affirm that the final word has been spoken on the problem of the literary origin of the first Gospel, and its relation to the other synoptics, but the facts on which opinions must be based find exceptionally clear statement in his Introduction, especially the grounds for holding the priority and superior historical trustworthiness of the Gospel of Mark.

Joseph Hatton, whose death has just occurred, in his sixty-sixth year, was not one of the great writers of his time, but few men were better known in the journalistic and literary worlds on both sides of the Atlantic. Born in Andover, England, he at an early age began to write for the *Derbyshire Times*, of which his father was founder and editor. Thus he was familiar with printer's ink almost from the cradle. In 1868 he had become so well known as a writer that he was intrusted with the task of editing and remodelling the *Gentleman's Magazine*. In course of time his duties called him across the Atlantic, and he made many acquaintances in the United States. Wide and varied as was his journalistic work, he found abundant time for miscellaneous writing. He was a prolific novelist, and some of his stories obtained great popularity. With the stage and its players he always kept up a close connection. He was an intimate of Henry Irving and wrote up his impressions of America. He did a similar service for J. L. Toole, who found but a cold welcome in the theatre here, although in private he was entertained with overflowing hospitality. He had a hand also in the version of "The Scariet Letter" which was played here by Richard Mansfield. "The Prince and the Pauper" was another of his pieces, as was the "Jack Sheppard" in which Weedon Grossmith made a great hit. The minor products of his pen are innumerable.

The late Francis Miles Finch, author of "The Blue and the Gray," who died in Ithaca on July 30, had very little of the author's vanity; his poems were never published in book form. Those who wish to find his "Nathan Hale," "The Blue and the Gray," his "Smoking Song," have to ransack anthologies and the song books of Cornell and Yale. He would sometimes complain of the irony of fate that attached the name of a jurist who had given all his life to the study of law to a little poem written in a moment of inspiration without any thought of literary fame.

Dr. Moritz Brosch, the historian, has just died in Vienna, at the age of seventy-eight. Among his works are "Pabst Julius II. und die Gründung des Kirchenstaates," "Bolingbroke und die Whigs und Tories seiner Zeit," "Neuere Geschichte von England," "Geschichte aus dem Leben dreier Grosswesire."

The death is announced of David Christie Murray in London, at the age of sixty. His first literary work was on the Birmingbam *Morning News*. In 1873 he went to London, and in 1879 turned to fiction. He was also a traveller and lecturer.

UNBRIDLED DEMOCRACY.

The Spirit of American Government. A Study of the Constitution: its Origin, Influence, and Relation to Democracy. By J. Allen Smith. New York: The Macmillan Co. $1.25 net.

The argument of this book is as follows: There was little of what is now known as democracy in the United States before or after the Revolution, and the government which was set up was designed to prevent majority rule. The spirit of the Constitution is inherently opposed to democracy, and the so-called evils of democracy are largely the natural result of those checks upon popular rule which the Constitution has imposed. A system of government involving checks and balances of power cannot be reconciled with the theory of popular government, because it denies the right of the masses to direct the policy of the state. We inherited the system from England, and the American statesmen of the formative period were no more democratic in thought than their English kinsmen. A democratic spirit, however, had been developed in America, because the immigrants were the more enterprising and dissatisfied elements of the English people, and because here there was a more even distribution of wealth than in England; but the Declaration of Independence in so far as it proclaimed the equality of man was not acceptable to a large proportion of the people, who desired independence, but did not believe in democracy. Immediately after the peace with Great Britain a tidal wave of democracy swept over the country; the legislatures of the States were generally made all-powerful and the Governors and judges put under their control. The Articles of Confederation were framed under the impulse of this movement, and failed as a scbeme of government not because the principles underlying them were false. Soon conservative thought became influential again, many who had been radicals became conservatives, and the democratic tendency gave place to a political reaction, which found expression in the Constitution. It is a capital error, therefore, to believe, as so many people do, that the Constitution is the embodiment of democratic philosophy. "The efforts of the Constitutional Convention," says Mr. Smith, "were directed to the task of devising a system of government which was just popular enough not to excite general opposition, and which at the same time gave to the people as little as possible of tbe substance of political power."

We are now trying to make an undemocratic Constitution the vehicle of democratic rule, yet it "embodies the political philosophy of the eighteenth century, not that of to-day." The Constitutional Convention sought to make a government which would possess great stability and freedom from change, thought the Articles of Confederation dangerously responsive to public opinion, and supplanted them by an elaborate system of Constitutional checks. One evidence of the undemocratic nature of the Constitution is the difficulty of amendment, in order that it migbt not yield to changes in public opinion. A small minority of the people was thus given power to prevent reform. Provisions to prevent amendment of a form of government to be effective must be lodged in some branch of government not directly responsible to the people. This branch in other governments is usually a King or an hereditary class; with us it is the Federal judiciary, a power made independent of the nation itself. This power was not explained to the people in the arguments made for the adoption of the Constitution. The proceedings of the Convention had been secret, but the people had an uneasy feeling that there had been a conspiracy against popular government. Had they really known what took place in the debates in the Convention they would have known that their fears were not without justification. The advocates of the ratification did not explain the Constitution to the people as they themselves understood it. Hamilton was the master in this deception. He favored the adoption of the Constitution because it would make the government largely independent of public opinion. He wanted the President to have an absolute veto on all State or Federal legislation. He got his veto, in effect, in the Supreme Court, and the law-making power was placed beyond the reach of popular control and put under the court, which, as it has exclusive power to interpret, has practically the power to amend or change. The exaltation of the Federal judiciary is a survival of the old mediæval doctrine that the King can do no wrong, and much the same attitude of mind which made monarchy possible is seen in our attitude towards the Supreme Court, which has been remarkably fortunate in escaping hostile criticism. Its decisions have been almost uniformly advantageous to the capital-owning class, which the unhindered progress of democracy would have affected, and it has been exalted by that class. Popular faith in the infallibility of the court has, however, been much shaken of recent years by its wavering policy in the legal tender, income tax, and insular cases. Tbe court is, in fact, a constant menace to liberty.

The undemocratic development of our political institutions has been the cause of the evils which have arisen. But the future is full of promise. The masses are coming to a consciousness of their strength; we are on the threshold of a new era when the few shall not rule tbe many.

Such is the argument of Professor Smith's book. The work has a certain importance, or, at least, significance, owing to the fact that it expresses so frankly the idea underlying a movement which is now with us and which must run its course. It is, in fact, scientific Bryanism, and draws the curtain, revealing the antagonism of latter-day democracy to the government under which we live. It will not, however, bring about or hasten the change desired by its author, for, while it is clever and well constructed, it is too radical and revolutionary to draw with it the sounder judgment of the people. Professor Smith points significantly in one of his chapters to the fact that Tom Paine, Patrick Henry, and Samuel Adams were not in the Constitutional Convention, and he should have added Thomas Jefferson to the list; but did these popular leaders ever show constructive ability? How long would a government erected by any one of them have lasted? It would have gone down in disorder and strife, and that very liberty which they loved so ardently would have been jeopardized. Undoubtedly, the human race owes a great deal to its leaders in the work of destroying, but it owes still more to its great builders-up. If the experience of mankind teaches us anything it is that direct government of an unchecked majority is tbe worst form of despotism, crushing down the free growth of the individual and even thwarting the genuine will of the people. For it must be observed that the national consciousness is not simple, but double. There is the passion, the quick-changing desires, the hasty injustice, the inconsiderate impulse to action of the people, as of the individual. There is also in each the deeper sense of what is right and proper and decorous, coming to the surface when the excitement of the moment is allayed. In the conduct of the individual, checks imposed by law and custom, by the respect for public opinion, and by the gradually formed habit of self-restraint, serve, or should serve, to place the restraining will in control of his acts. And in this governance lies the only liberty. In the people at large this same influence can be assured only by respect for the past and by the checks of law and tradition. The Constitution, in a word, serves to give the second and deeper consciousness of the people the needed control over its first impulses. What Professor Smith desires in government would correspond to the untrained, unhampered individual, the slave of impressions. He has no understanding of the true democracy, which aims at once at the liberty of the individual, as also of the masses. And this liberty consists in resting the power of government in the more abiding national consciousness.

CURRENT FICTION.

The Sinner. By Antonio Fogazzaro. Translated from the Italian by M. Prichard-Agnetti. New York: G. P. Putnam's Sons.

The first member of Fogazzaro's trilogy, "The Patriot" (*Piccolo Mondo Antico*), was published in 1896, "The Sinner" (*Piccolo Mondo Moderno*) in 1901, and "The Saint" four years later. "The Sinner" is now before us in English dress. Tbe title is rather misleading, since the author has apparently intended to represent not so much the moral life of an individual as the working of forces distinctive of a period. In "The Patriot" the chief motive was really the struggle between blind faith and reason which, in every aspect of life, occupied an Italy gathering berself to throw off the Austrian yoke. In "The Sinner"

the struggle is between love and duty, under the conditions of modern Italian life. Franco and Luisa Maironi, the principal figures in "The Patriot," were comparatively simple creatures, but the conflict of their natures is perpetuated in the nature of their son.

The novelist is a firm believer in the working of heredity; he sees in the war which takes place in Piero Maironi between sensuality and asceticism the inevitably legacy of that former strife; something, too—the fruits of victory, perhaps—of the morbid condition now labelled neurasthenia. Piero Maironi has married a girl whose temperament does not harmonize with his, and who presently becomes insane. Thrown back upon his solitary life, the young husband suffers much. Eventually, in a public conveyance, he sees a beautiful woman whose face arrests him, and upon whom he himself makes a strong impression. They meet, and find themselves irresistibly drawn together. Though strong in her virginal instincts, and desirous only of his innocent love, "She hoped, hoped passionately, ready to make any sacrifice joyously, to see him less often, to deny herself the delight of caresses, the sweetness of the familiar *thou*, should he demand these things, if only she might keep his love, if only he would not leave her." As it chances, the other extreme of sacrifice is demanded of her. She knows that there is one means of binding him to her forever. She gives him unspoken promise of what his passion calls for. At the eleventh hour, news comes that the wife has recovered her reason, and wishes to see him before she dies. He hastens to her, full of remorse, to find her dying, but full of tenderness for him. He experiences a sort of conversion, and after her death disappears without trace, presumably to devote himself to the religious life.

The Artistic Temperament. By Jane Wardle. New York: McClure, Phillips & Co.

The reviewer who takes up this book with a sigh, expecting nothing more than a vain repetition of that sad drivel, which is now apparently marketable, about the weak-kneed gentleman with few brains and no morals, will hardly lay it down without a smile of gratitude. The gentleman who prominently inhabits these pages is sufficiently weak-kneed, but while we preserve for him that sympathy which is felt to be due to infancy, senility, and genius, we are not absolutely required to worship him in his more or less malodorous tracks. One can get a fair notion of the data which the writer has assembled, from a dialogue between the artist in question and the married woman who nearly, but not quite, becomes the victim of his philandering.

For example, the man who is engaged to her sister spends, she says, all his money on books.

"It seems a fairly moral way of speculating, doesn't it?" says the painter, busily working on his portrait.

"I don't mean useful books," she responds, deprecatingly, "that would do him any good, but novels and poetry and things like that. I am really sometimes almost afraid that it is affecting his—but I oughtn't to say that. There are two especially—one who writes detective stories and another, a man called, what is it? Shaw—Bernard Shaw, I think. Do you know the name?"

"I think I heard it somewhere. He's a humorist, isn't he?"

"I don't know. Robert lent me one of the things he'd written and it seemed to me mere nonsense. But Robert takes him quite seriously, and calls him the greatest writer that ever lived. And since he has begun to read so much, he says and does the strangest things. He said to be a good artist, you had to be an immoral man. And that—what was it?—yes—that art was a beautiful flower that was rooted in corruption."

"Did he get that out of Mr. Shaw, or the detective stories?"

"I don't know. I expect it was from one of those clippings he cuts out of the papers like he showed you. Wasn't it absurd?"

But our Mr. Cartmel assures her that "After all, you know, a country is never any good artistically till it is going to the dogs. A lot of silly people spend their time groaning because England isn't an artistic country, and trying to make everybody artistic by Act of Parliament. But it's an uncommonly good thing for England that she's not artistic. And for Art, too."

This sounds like mastery, of the satirical art, at least; and it is a credit to the author that when the clever fellow turns out to be a veritable member of the clan of the invertebrate, the pseudo-artists, she refrains from gilding him and setting him upon a pedestal. The wife and he are rescued from each other by the honest husband; our temperament is presently wedded to a character; and is audible at the fall of the curtain, in his rôle of President of the Royal Academy, uttering the following deliciously ironical remarks:

I will go further and say that the man who possesses the artistic temperament is, by that very fact, incapable of a crime against the beautiful, material or spiritual; is incapable of a mean, petty, or dishonorable action; is incapable, in a word, of any action contrary in spirit to all that we imply when we speak of a gentleman and—if I may say so without seeming to imply anything derogatory to our sister nations—of an English gentleman *par excellence*.

The Confessions of a Daddy. By Ellis Parker Butler. New York: The Century Company.

This thin volume comprises three short narratives which have already been published in the magazines. Mr. Butler's gift for treading a narrow road between the commonplace and the quaint is better exemplified in the second and third chapters than in the first, where his hand falls a bit too heavily. If, as a whole, the volume is not as overwhelming funny as his "Pigs is Pigs," it is still a delightful bit of humor.

The Popular Ballad. By Francis B. Gummere. Boston: Houghton, Mifflin & Co. $1.50.

The above is the initial volume of the series on The Types of English Literature, of which Prof. William Allan Neilson is the general editor. There can be no dispute as to the appropriateness of assigning the Ballad in this series to Professor Gummere. By the preface to his "Old English Ballads" and by his work on the "Origins of Poetry," he has won for himself a place among the leading living authorities on the subject of popular poetry, and he combines with his learning an unusual gift for popularization. The work before us consists of four parts, devoted respectively to the origins, the classification, the sources, and the literary value of the ballads. On the last head, it is perhaps needless to say that Professor Gummere writes *con amore*, although with a full recognition of the limitations of popular literature. Perhaps all the more for the mystery that envelops its past, the ballad has an inexpressible charm as the "voice of the people" from a far-distant time. "The great poems of the world," as our author finely says, "are far greater than the greatest ballads; but no poet has ever had the power to compete with popular tradition on its own ground. Art can create far beyond the beauty of sea shells, and on occasion can exactly reproduce them; but it cannot fashion or imitate their murmur of the sea."

The difficult task of classifying the ballads according to their various themes and of giving some account of their contents Professor Gummere has successfully accomplished. Riddles, flytings, ballads of battle and lawless love, ballads of outlawry and the rest, with all their imperishable associations of romance, are passed under review and are characterized with sympathy and critical judgment. The chapters on the burning questions of the origin and sources of the ballad, however, are those to which the student of literature will doubtless first turn in this book. The views which Professor Gummere expresses on these subjects in the present work do not differ from those he has expressed elsewhere, although they may have gained somewhat in definiteness of statement. It must be confessed, however, that there is in these chapters still too much of the *vague vapoureux* with which Cosquin reproached the Grimms in regard to their views on the origins of popular poetry, and one has to search pretty closely for some passage to correct the general impression that our author has not advanced very far, after all, beyond the impossible formula of the Romanticists: "Das Volk dichtet." The truth is that, with all his erudition and vivacity, Professor Gummere's discussion of these difficult problems is deficient in simplicity and directness. There is in his own work too much of the "leaping and lingering" which he ascribes to his primitive choral throng, and one begins to doubt whether he has himself any clear idea of the development of the ballad out of its choral origins into the more or less epic form in which we have received it. In our judgment, the fundamental cause of this erroneous impression, if erroneous it be, lies in his not grappling directly with the question—he "gambols from the matter." But take such a passage as the following (p. 84), which expresses the author's theory about as definitely as any in the volume:

But it may be said generally that the course of the popular ballad is from a mimetic choral situation, slowly detaching itself out of the festal dance and coming into the reminiscent ways of tradition in song and recital. Of that primitive choral ballad nothing is left but the traces of its course and the survival of its elements in later stages of evolution.

Have we really got out of the *vague vapoureux* in such a passage as this? For our own part, we wish that in discussing

these thorny matters Professor Gummere, like his "chronicle ballad," had "felt that grim work was cut out" for him and therefore had taken "the nearest way." One feels how much more definite are the views of the imaginary critic of this theory of ballad origins, as Professor Gummere himself states them. So, for instance, we confess ourselves in full sympathy with this critic when he asks: "Why not take the obvious way, giving the choral to the chorus and the poem to the poet?" One may grant that the gift of improvisation is "universal" among primitive peoples in the sense that everybody, more or less, takes part in choral songs, but all human experience proves that "improvisations" that can stand the test of time, as the ballads have stood it, must be the products of a few gifted minds. The process of "incremental repetition" would never suffice to make something out of nothing.

As regards the sources of the ballads, we wish that Professor Gummere had given a somewhat fuller assent to the view urged by Andrew Lang, that there may be "in many places spontaneous and independent production of similar narratives," so that similarity in the ballads of different countries need not always be set down to the account of borrowing or a common origin. To say nothing of the experiments of M. Bédier in this field, the view here expressed is so obviously in accord with ordinary experience that it surely ought to be given due weight in any investigation of ballad sources.

Notwithstanding the differences of opinion which we entertain regarding these matters of controversy, we gladly acknowledge the interest of Professor Gummere's work, and believe that it will be accepted as beginning auspiciously a series which promises great usefulness.

Capt. James Cook, R. N., F. R. S. "The Circumnavigator." By Arthur Kitson. With map and illustrations. New York: E. P. Dutton & Co. $4.50 net.

This is the stimulating story of a man in reviving the memory of whom Mr. Kitson has rendered a genuine service. Not by the accident of birth, nor the advantages of education, or of unusually favorable circumstances did James Cook win distinction, but because he made the best use of his opportunities. The son of a day laborer, as a lad the assistant of a village grocer and haberdasher, at eighteen a cabin boy and seaman till he was twenty-eight, in the twenty-two years he was a commander he gained the highest rank among navigators of his time, and conquered the attention of the civilized world. That this is no exaggerated statement is shown by the instructions issued in 1780 by the governments of France, Spain, and the American Colonies, then at war with Great Britain, to their naval officers. For example, the French minister declared that "it is the King's pleasure that Captain Cook shall be treated as a commander of a neutral and allied power, and that all captains of armed vessels, etc., who may meet that famous navigator, shall make him acquainted with the King's order on this behalf."

In like manner our representative in Paris, Ben. Franklin, says in his instructions that Captain Cook is to be shown every respect, and be permitted to pass unattacked on account of the benefits he had conferred on mankind through his important discoveries. Such a tribute to a man's value to the world we do not recall, and certainly it was an honor to the nations by whom it was conferred. When the news of his death reached Europe it is recorded that "the Empress of Russia expressed a most deep concern at the loss of Captain Cook. She was the more sensibly affected from her very partial regard to his merits."

There are very few personal touches in the sources from which the biography is drawn, for the man seems to have been so absorbed in his work as to lose sight of himself, but we have a glimpse of him as a boy which seems to reveal the secret of his success. During the intervals of his early voyages as a seaman in the coasting trade, he lived at the house of the man to whom he was apprenticed. "He made great friends with Mr. Walker's housekeeper, Mary Prowd, from whom he obtained the concession of a table and a light in a quiet corner, where he might read and write in peace." Almost the only other personal touch is in connection with this same woman. For when he returned from his first voyage, the old housekeeper "had been carefully instructed that a Commander in His Majesty's Navy was a very different person from one of her master's apprentices, and that he must be received with all the marks of respect due to his rank. She promised obedience, but, when the time came, she forgot her instructions, and opening wide her arms, exclaimed: 'Oh honey James! How glad I is to see thee.'"

Cook's fame rests mainly on his work as an explorer during his three voyages in both Polar regions, the northwest coast of America, and among the islands of the Pacific. Striking testimony to the accuracy of this self-taught navigator is given in the fact that many of his charts are even now the basis of those actually in use at the Admiralty, and of these there is much that has been found to require no alteration. But he ranks high among the world's benefactors through his successful contest with that scourge of the sailor of the eighteenth century, scurvy. Of its terrific ravages we may form some conception from the statement that during Cook's early days at sea it was no unusual thing for a man-of-war to find herself short-handed through its effects after a cruise of only a few weeks, and in a voyage across the Atlantic as many as 20 per cent. of the crew are known to have perished. With these experiences of his own he determined, as soon as he became commander, that it was his duty to fight the dreaded scourge in every possible way. That duty he discharged most faithfully, for in his second voyage, which lasted three years and eighteen days, he lost only four of his crew—three of the deaths being accidental and only one from disease—"a record unprecedented in the annals of English naval history." He himself attributed the health of his crew "in a great measure to the Sour Kraute, Portable Soup, and Malt," but the personal cleanliness of his men was a strong point with him. He never suffered "any to appear dirty before him," writes one of his men, "in so much that when other commanders came on board, they could not help declaring they thought *every day* Sunday on board of Capt. Cook." In 1776 the Royal Society awarded him the Copley gold medal for having provided "the means by which Britain may now, on the most distant voyages, preserve numbers of her intrepid sons, her mariners." But his care for the welfare of his fellowmen was not confined to sailors. The forlorn condition of many of the natives in the islands at which he touched, especially in the matter of food, appealed to him so powerfully that he carried in his ship live stock and supplies of garden seeds, such as peas, beans, cabbages, turnips, onions, etc., to be given them in the hopes of stocking the islands. When the Resolution left the Cape in his last voyage, writes a contemporary, "she was so stocked with animals that she resembled Noah's Ark." Although the natives were inveterate thieves, and force had often to be employed to recover the stolen property and to defend the sailors, his sincere regret at the necessity is always recorded. His death was due in a certain sense to an accident. The trouble began as usual with a theft, and Cook went on shore to quiet the disturbance, and was received with the usual marks of respect. But soon he was threatened by a man armed with a stone and an iron spike, and a heavy fire of stones was opened on the marines. Cook went to the water's edge and "turned round to call to the boat's crew to cease from firing, and pull in. This is believed to have been the cause of his death, for, while facing the natives, none but the man shot by Gibson had offered him actual violence, but when he turned to give orders to the boats he was struck on the head and stabbed in the back, falling with his face in the water." A voyager among the islands twenty years after, says that "in Owhyhee the fatal accident which befell Cook is to this day deeply and generally deplored."

Mr. Kitson's work shows great painstaking labor; he corrects several serious misstatements of previous biographers, and adds some new and interesting facts. If he errs, it is in too much detail—an error into which he is led by his enthusiasm for his hero and the belief that his readers will be interested in every minutest circumstance which Cook himself has narrated. But one soon loses interest in the number of pigs, for instance, brought by the natives of the different islands as gifts to their strange visitors. The desire for absolute accuracy is so impressed upon his book that attention may be called to one or two slight errors. The date of the letter on page 218 should be 1771, and Louisburg is not "situated on a promontory at the *northeast* of the island of Cape Breton" (p. 30).

The volume is attractively got up, with an excellent index and map, and twenty illustrations. Four of these are reproductions of paintings by "Mr. William Hodges, a painter of repute," who accompanied Cook on his second voyage, being "specially appointed by the Admiralty to take views of the principal places of interest visited by the ships." Mr. Kitson closes with a reference to the few insignificant memorials to his hero that have been erected, and rightly says "it seems strange that this great discoverer, and perhaps the greatest benefactor that the maritime services of all nations ever had, has been so neglected."

The Creed of a Layman: Apologia pro fide mea. By Frederic Harrison. New York: The Macmillan Co. $1.75 net.

No man is better entitled than Frederic Harrison to speak with authority on English Positivism. He witnessed its beginning, and has been *magna pars* of its history. While an undergraduate at Oxford, he accepted Comte's view of general history; in 1867 he took part in establishing in London the Positivist Social and Political Union; from 1870 to 1879 he was a supporter of Richard Congreve's Chapel Street Positivist School (afterwards called the Church of Humanity); and when Congreve broke away from the Paris society, he became a member of the English Positivist Committee formed by Pierre Laffitte, the pupil and successor of Comte, with headquarters in Newton Hall, and was president of this organization from 1880 to 1905. He was in intimate association with the Comtist leaders, French and English, and labored incessantly, by lectures and writings, to expound Comte's philosophy and religion to the English public, and to defend it against the criticisms of Ruskin, Spencer, Huxley, Mallock, and others. A full sketch of the Comtist movement in England, such as he could give, would be welcome. The present volume, however, as the title indicates, is simply a statement and defence of his own religious position—a bit of autobiography that should be interesting even to those whose theological opinions he assails so vigorously. He tells of his early training in the doctrines of the Church of England, all of which he accepted fully; his studies in the physical and biological sciences, and his consequent rejection of church dogmas and adoption of a general theism, and his final complete acceptance of Comte's views. But though he came to rest in Humanity as the only intelligible object of religious reverence and guide and support of life, he seems never to have been friendly to the ecclesiastical form of organization favored by Comte, Laffitte and Congreve. He has not refused to recognize Comte's nine "Sacraments"—he here prints addresses that he made on the day of all the dead, the presentation of infants, initiation, destination, marriage, burial, and other occasions—but he regards these ceremonies as purely practical and scientific, and is apparently averse to styling the Positivist organization a church.

The greater part of the book is made up of reprints of certain of the author's magazine articles and addresses. The most interesting of these is his notice, published in the *Westminster Review* of October, 1860, of the famous Oxford "Essays and Reviews," which that year reached a second edition. For readers of the present generation it is often difficult to understand the excitement produced in the English religious world by this volume. Most of its critical conclusions are now regarded as commonplaces, and are condoned if not adopted by the Church of England. But in 1860 its positions seemed revolutionary and destructive. If not the most important religious work published in England for two hundred years, as Mr. Benn has recently termed it, it was the first public recognition by churchmen of good standing of the new results of Biblical criticism. It seemed to many to destroy the foundations of Christian faith; it was denounced as infidel and treasonable. The highest authorities, to be sure, were not much affected by this storm of condemnation: the authors of the essays were not visited with condign punishment; on the contrary, Jowett became Master of Balliol, Temple Bishop of London and Archbishop of Canterbury, and others were honored in various ways. But the popular indignation remained great, and it was in the midst of the excitement that Harrison's review appeared. His point is that the Essays give up the church doctrine of inspiration and revelation, and practically throw over the supernatural element in the Christian creed. He insists that honest thinkers will be unable to rest in the compromises suggested by the Essayists—religion, he says, to maintain its hold on man, must be in harmony with all scientific thought. The article is clear and vigorous, and its demand for honesty and consistency is as pertinent now as it was then. Its ruthless logic has no charity for the happy inconsistencies of human thought. It is true that in the public services of the churches the imprecatory psalms are read from the pulpit, and prayer is offered for rain; but none the less preacher and people in theory adopt the gentler teaching of the Sermon on the Mount, and believe in the reign of physical law. Our author might have laid more stress than he has done on the fact that the moral accompaniments of any system of life, religious or philosophical, are determined mainly not by theories and creeds, but by the social atmosphere.

Mr. Harrison's defence of his Positivist faith does not offer any new point of view. His ethical creed is not the product of Positivism, or of any other system, but of the general influences of modern life. His empirical philosophy is held to-day by many men of different schools; it is especially emphasized, for example, by the new Pragmatist doctrine. The only point that particularly interests us in Positivism is its cult of Humanity; we wish to know what it is in this faith that secures the devotion of a man of Mr. Harrison's wide culture and general sanity of thought. Of his enthusiastic devotion there is no question. The reason for his faith is given most distinctly in his article entitled "The Creed of a Layman" and in his essay on "Pantheism and Cosmic Emotion." The constitution of his mind is religious, he demands an object of religious reverence, cannot rest in a materialistic conception of the world, and is thus shut up to a choice between theism, pantheism, and the cult of Humanity. But science, he holds, has sublimated God into an abstraction, an ideal without living content, without emotional contact with actual human life, and on philosophical pantheism, subtle and grand as it is, lies the blot that it jumbles up the moral, the immoral, the non-human, and the anti-human. There remains only Man, with his splendid endowments, standing above physical nature, offering us something to reverence, to live for, to take as a source of comfort and strength. It is, of course, an ideal Humanity that Mr. Harrison reverences, a selection of the best in human nature. Taken in the mass, men are not only ignorant and slaves of appetite, but are vastly more cruel than external nature. And, one might ask, if Humanity is to be idealized, why not the cosmos? For the rest, the love of humanity has been preached by all ethical teachers, and is professed by all who aspire to a moral life. There is no better ethical motive, and if it be a comfort and support, there is no objection to calling it a religion.

Victor Hugo's Intellectual Autobiography (Postscriptum de ma Vie). Translated with a Study of the Last Phase of Hugo's Genius by Lorenzo O'Rourke. New York: Funk & Wagnalls Co. $1.20 net.

Lorenzo O'Rourke has attempted the almost impossible task of translating a volume of Victor Hugo's "ideas" on literature, philosophy, and religion, composed of the last of his posthumous manuscripts issued at his centenary. It is not surprising that the results are mediocre. There are three phases of Hugo's literary productions—his fiction, his poetry, his criticism or pseudo-philosophy. As a novelist he is best known to English readers, as a poet he is greatest; of the originality of his thoughts and reflections the least said the better. The present volume contains disquisitions on matters such as genius and taste, the beautiful, the infinite, life and death, God, atheism, supreme contemplation. No pent-up Utica ever contracts Hugo, but it was an unkind service to "betray" him into English. He says himself in the present volume, "Idea is style; and style is idea. Try to tear out the word, it is the thought that you destroy. For thought, expression is what it needs must be, a garment of light for this spiritual body." In the hands of a somewhat unskilful translator the wordiness of Hugo becomes apparent instead of the words, the flux of hurrying rhetorical questions which do not stay for an answer, the artificial antitheses of clauses, the wearying iteration of encyclopædic illustration. Victor Hugo is a great lyric, and at times a great epic, poet. His criticism is prose poetry. Put it into literal English and simplified spelling and the result is largely sound and fury.

Mr. O'Rourke, an intense admirer of Hugo, has accompanied his translation by a sympathetic, though emotional, discussion of the author's genius. It deserves the epithet which an American undergraduate trying to lisp in French applied to Swinburne's eulogy of the same author: "Un éloge gonflé de Victor Hugo." In fact, Mr. O'Rourke puts his hero above Dante, Milton, Æschylus; the poetry is written with "a pen plucked from the wing of the dragon of the Apocalypse"; he "fashioned for himself a mighty organ whose gamut ranged from the pipes of Pan to the trumpet of the Last Judgment"; he is "the Michelangelo of modern literature, carving in the Pentelic marble of the Ideal." Apart from this rhetoric the editor gives an interesting and faithful summary of M. Mabilleau's analysis of Hugo's color vision of the world and some judicious criticism.

The translator's knowledge of French is, on the other hand, unequal to his task. He makes Hugo say that "Molière was a product of the pillar of Halles," that we should not "look for midday at two o'clock"; and simple expressions like *cuisse d'or, dame de piquc, casier* and *soupeur*, being evidently too much for him, remain in the original. The effect of the volume in its English form is of a wild medley of jerky phrases. The power of Hugo's marvellous and thrilling sweep of language is lost, and one is led to apply to the book Hugo's own phrase upon the realm of dreams and visions, or rather the one which Mr. O'Rourke has substituted, that "All this chimera is full of boomerangs!"

The Imperial Gazetteer of India. The Indian Empire. Vol. I. Descriptive. III. Economic. IV. Administrative. New Edition. Published under the authority of His Majesty's Secretary of State for India in Council. Oxford: At the Clarendon Press. $2 net each.

It is significant of the growth of India during the past quarter of a century and its increased importance that the Imperial Gazetteer, originally published in 1881, has expanded from nine to twenty-six volumes. Of these the first four, entitled Descriptive, Historical, Economic, and Administrative, are an enlargement of the independent volume by Sir W. W. Hunter on the Indian Empire which appeared in 1893. The present work is based on the results of the Census of 1901, and, with the exception of parts of the introductory volumes, has been written by officials in India, "and every page has been submitted to the criticism of the several Administrations or Departments concerned." The mass of material from which the facts are drawn is almost inconceivable, the manuscript records of the Military Boards from 1773 to 1858 alone consisting of "739 ponderous tomes." A cursory glance even at the three volumes which have been given to the public, would convince one that on many accounts India is the most interesting of all countries. It has a greater variety of structure, climate, productions, and people than any other region of equal size. In one place an annual rainfall of 950 inches has been recorded, in another absolutely no rain fell for a year. Its flora, with nearly 17,000 flowering plants and 300 different kinds of rice in a single district, is unsurpassed in its variety, while its animal species far outnumber Europe's, and it "is the only country in the world inhabited by all the known families of living snakes." The people differ more in race, language, habits of life, and degrees of civilization than those of any other country, nor is there anywhere else anything resembling the several thousand castes into which the Indians are divided. The absolute prohibition of mixed marriages being the essential and most prominent characteristic of caste, the population consists of separate strata in which there has been little fusion for untold ages. "There is consequently no national type, and no nation in the ordinary sense of the word." This is a pregnant fact which those who advocate self-rule for India should ponder.

Sir Thomas Holdich, very appropriately, contributes the opening chapter of the first volume, descriptive of India's physical aspects. An evidence of the growth of our knowledge in this direction is his allusion to the fact that the Tsan-po in Tibet and the Brahmaputra are one and the same river, a result gained through the native Indian surveyors. The most interesting of the subjects treated in this volume is caste. Its history, so far as it can be traced, is sketched and a multitude of facts are given to show its nature, and the various theories accounting for it are discussed. The presence of low-caste children in a common school is objected to on account of the physical contamination supposed to be involved. In some provinces and among certain classes, the degraded castes are allowed to sit either in a veranda or on a lower section of the floor than the rest and to deposit their books and exercises on the floor instead of handing them to the master. The conclusion of the writer comes to this, that "the origin of caste is, from the nature of the case, an insoluble problem." An encouraging fact in the chapter on Public Health is the prolongation of the age limit, more in the women than in the men, demonstrated by the last census returns. The Economic volume is devoted to a description of the natural wealth of the country, the industries of the people, and the railway construction and irrigation works of the Government. It also contains a lucid treatment of the famine problem, which shows, among other encouraging signs, that the Maharaja of Jaipur and his family have founded a trust amounting to $1,000,000 for the relief of the needy in times of famine.

The most important of the three volumes is the fourth, on the administration of the country. It deserves the careful study of every one whose task it is to govern an inferior race. The guiding motive of the English ruler is to be found in the first chapter, in which the primary duty of the collector or district magistrate is "to be accessible to and intimately acquainted with the inhabitants." He is to spend several months of the year in camp, so that the local magnates and village elders may have a ready opportunity of discussing their affairs with him, as the assessment of their lands, the opening of a new school, some local quarrel in regard to the right of way; in fact, everything that touches their daily life. In this way he is to gain the affections of the people, "and tales of his sagacity and good deeds will be told in remote villages many years after his name has ceased to be borne on the civil list of his province." An admirable and copious index in this, as in the other volumes, makes it perfectly easy to refer to any subject on which information is desired. The Gazetteer is a monumental work, and is a fitting commemoration of the close of the first half-century of the Indian Empire.

Religion and Experience. By J. Brierley, B.A. New York: Thomas Whittaker. $1.40 net.

Popular writers on religious subjects are, as a rule, unfortunate in their use of science and philosophy. This is due doubtless to superficiality of knowledge, to the lack of an intellectual aim, and in part also to an overreaching desire to be abreast of the times—to possess and use the latest novelties. Such writers too often glean without discrimination verified results, untried hypotheses, vague speculations, and fragments of philosophical systems drawn from various sources, and use them to suit the demands of religious tradition or popular edification. The present book is a case in point. Mr. Brierley draws at will from the philosophical idealism and empiricism of the day, and does not hesitate to argue the religious and moral consequences of telepathy and radio-activity, all of which lends to his book a journalistic, and at times meretricious, character that largely destroys its value. His fundamental purpose is beyond criticism. He proposes after the manner of the day to study religion in the religious experience rather than in its organizations and formularies; and at the same time to give to his study a devotional and practical character. But he does not appear to realize what is involved in his method. Thus, arguing from the general subjectivistic principle that outer objects are what the mind of the onlooker makes them, he contends that the beginnings of Christianity can be understood only from a study of the characteristic historical state of mind which put its stamp upon them. We are led to conclude that Christianity reduces to the experiences of Christians together with some vague and inaccessible cause that is to be inferred from them. And when one has reached this point of reducing religion to inner experience, a psychological explanation will do as well as any other, if, indeed, it is not the only one left. The author is thus in the position of having virtually thrown overboard the whole structure of objective belief that alone can distinguish Christianity or any other religion from a system of mental therapeutics.

But it would be misleading as well as unjust to represent this book only in point of its method and consistency. Although the title is a legitimate and suggestive one, the whole is not a treatise so much as a collection of essays, dealing with such miscellaneous topics as Pleasure, Doctrine and Life, Fatigue, Politics and Religion, and Inner Discipline. All the essays are interesting, and often, as in the chapter entitled "The Solitaries," the style is both graphic and eloquent. The author is widely and well read, and his allusions to literature, history, and biography, though repetitious, and too suggestive of a recent reading of Oscar Wilde and Moncure Conway, are never inapt. The various subjects are well exploited, and the conclusions, while marked by an optimism that is too easy-going to bear a searching criticism, are unquestionably honest, kindly, and wholesome.

Some Problems of Existence. By Norman Pearson. New York: Longmans, Green & Co. $2.10 net.

This volume, containing within brief compass speculations which carry the reader "from before the cradle to beyond the grave," is liberal in spirit, attractive in style, but totally lacking in solidity and cogency. Not only is the author's method highly "speculative," but he bases his whole procedure on postulates which he has adopted and interpreted to suit himself:

> My postulates for this theory are: (1) the existence of a Deity, (2) the immortality of man, (3) a Divine scheme of evolution of which we form part, and which, as expressing the purpose of the Deity, proceeds under the sway of an inflexible order. Such postulates, I think, are not too extravagant, and will suffice to meet the needs of the case.

Just what "the needs of the case" are is not precisely clear, nor are the postulates themselves unequivocal in meaning. God, Immortality, and Order are assumptions sweeping and vague enough to meet almost any needs, and especially the traditional religious needs which the author seems to

have most at heart. No effort is made to justify these postulates. Thus, in connection with the personality and existence of God, it is remarked that "neither belief is demonstrably true; yet each alike is attested by an almost irresistible tendency of thought." There could be no clearer revelation of logical innocence. For fundamentals we are compelled to be satisfied with a set of arbitrary and ill-defined dicta. But the author's looseness of thought not only vitiates the general philosophical standpoint of the book, but creeps into the discussion of special topics. This is well illustrated by the treatment of the problem of the development of mind. While the development of mental structure proceeds *pari passu* with that of physical structure, "it cannot follow quite the same route," for "the physical structure of an animal in due course breaks up after death, and survives alone in the structural *tendencies* transmitted to its offspring." If we ask why mental structure cannot follow the same route, we must content ourselves with a speculation that is supposed to accord better with the demands of religion. The author has "advanced the suggestion that this does not perish with the body, but survives as a discarnate mind-structure." Similarly, right and wrong are obscurely based on a "Divine scheme of things," with no indication of the way in which mankind is to discern it. Again, the problem of evil is solved by the hypothesis of a dual God. The one manifestation, the God of philosophy, is omnipotent, but non-moral; the other, the God of religion, is benevolent, but finite. Thus the old contradiction between the perfection and omnipotence of God is avoided by assigning these attributes to different beings, while our natural misgivings as to the relation between these two beings are quieted by the simple suggestion that the one may be supposed to be evolved from the other by a process of "self-limitation"! In conclusion, it ought to be said that while the various theories advocated in this book, such as that of the continuous development of individuals through successive levels of mental structure, infra-human and super-human, and that of the finiteness of God, are badly formulated and worse reasoned, they are by no means intrinsically absurd. Indeed, if one overlooks its crudities of method and its scientific and philosophical dilettanteism, the book as a whole impresses one as rather a happy blend of naturalism and theism, reflecting both an attractive personality and a broad tendency characteristic of the age.

Vent' Anni di Vita Italiana attraverso all' Annuario. Note e Commenti di Ernesto Nathan. Rome: Casa Editrice Nazionale.

Signor Nathan has produced a book of much value. He has taken the official annual year-books of Italy for twenty years beginning in 1882, summarized them, and deduced from them the symptoms, favorable or unfavorable, which mark Italy's recent development. He divides his subject into three sections—economic, intellectual, and moral—of which the last includes such topics as population, suicides, emigration, crime, salaries, strikes, savings banks, army and navy, and parliament.

In almost all cases the data show a healthy growth. Thus the deposits of savings have risen from 1,040 to 2,200 million lire, and the number of railway passengers from 32 to 61 millions; there has been an extraordinary industrial expansion in the North, and a corresponding extension of commercial relations with foreign countries. On the other hand, agricultural conditions, whether owing to drought, antiquated methods, lack of capital, or other causes, have not improved in the South. Hence, an ominous increase in emigration. Illiteracy is slowly diminishing, but it will require a long time to wipe out that blot which under the old governments was promoted, and is still the means by which the Clericals maintain their hold over the peasants. The record of crimes is not satisfactory, the number of juvenile delinquents (under eighteen years of age) being on the increase.

The tables and summaries given by Signor Nathan are greatly enhanced by his interpretation of them. Being himself half-English, with wide acquaintance with English economic and social conditions, he is able to treat his study by the comparative method. He also refers constantly to corresponding statistics for Continental Europe and the United States. For many readers, the most interesting part of his work is the final section, in which he analyzes the political elements and discusses the various activities of the Socialists and Clericals. He leaves the impression that Italy was never so solidly established as at present. Signor Nathan writes so vigorously, always keeping his eye on the human interest underlying the statistics, that his book is easy reading. It will be indispensable to every one who makes a first-hand study of contemporary Italy.

A Commentary on the Life and Character of Charles James Fox. By W. S. Landor. New York: G. P. Putnam's Sons. $2.75 net.

This is a hitherto unpublished work of Landor's. It was printed in 1812, but not issued, Murray, the publisher, withdrawing from the venture at the last moment. "The manuscript must have been destroyed ages ago. Of the printed copies only one is known to have survived. This is in the possession of the Earl of Crew." (Editor's preface.) The objection to the work was political. Landor had dedicated it to President Madison, and Gifford wrote to Murray:

> I never read so rascally a thing as the Dedication. It shows Landor to have a most rancorous and malicious heart. Nothing but a rooted hatred of his country could have made him dedicate his jacobinical work to the most contemptible wretch that ever crept into authority.

In the Dedication occur such passages as this: "Between the government of Napoleon and the British, no people is permitted to regulate its own affairs. We rivet the chain, he breaks the limb in striking the link assunder." This was not likely to please Gifford, and apart from the furious diatribe against Fox, which constitutes the ostensible substance of the book, its tone was too pro-American to be publishable in England at that particular period of history. But Landor's purpose was wise enough. The war of 1812 was in the air, and his Dedication was an appeal to Madison to do his best to prevent hostilities:

> A war between America and England would at all times be civil war. Our origin, our language, our interests are the same. Would it not be deplorable, would it not be intolerable to reason and humanity, that the language of a Locke and a Milton should convey and retort the sentiments of a Bonaparte and a Robespierre?

As an historical estimate of Fox the book is too polemical to have much value, but the style has a rare energy and color.

Science.

The remarkable journey which Capt. Arnaud has just made across Western Africa from the Mediterranean to the Gulf of Guinea in a little more than a hundred days, shows the extraordinary progress in the pacification of the Sahara. The distance traversed was 3,224 miles, of which nearly half were on dromedaries and the remainder on horseback, in canoes, and 775 miles by railway. The rapidity of the journey across the Sudan and Dahomey, 868 miles in twenty-four days, likewise shows the progress in the creation of the routes in the vast French West African empire. The mission brings back very important data as to the geography of many hitherto untraversed and mountainous districts.

Last year, the structure for scientific studies, erected on the Punta Gnifetta, 4,559 metres above the sea, almost the highest point in the Monte Rosa group of mountains, by the ex-Queen Margheretta of Italy, was set apart for its special purposes. On the same Italian side of the Alps, on the Colle d'Olen, 2,871 metres above the sea, another and much larger building has now been erected for similar purposes, its international character being apparent from the fact that the Governments of Belgium, Germany, England, France, Italy, Austro-Hungary, and Switzerland contributed the bulk of the funds. The structure will house the International Scientific Institute for Physiological Studies in the Higher Alps. The most enthusiastic worker for the cause is Prof. Angelo Mosso, the famous savant of the Turin University. The building contains seventeen study rooms and sixteen dwelling rooms, and is connected by telephone with the nearest Italian village. Five study places are assigned to Italy, two each to Belgium, England, Germany, France, Switzerland, and Austro-Hungary, and one to America. The laboratories are well equipped.

Italian savants are about to organize an Academy of Sciences modelled after the British Association called Società per il Progresso delle Scienze. The first meeting, to be held in September in Parma, is to include departments in mathematics, natural science, medicine, engineering, statistics, and political economy.

At a meeting of the British Ornithologists' Club Mr. Eagle Clarke exhibited specimens of the Artic tern (*Sterna paradisæa*) which had been collected on the recent Scottish National Antarctic Expedition in 74 degrees south latitude off the Antarctic continent. As this bird reaches

82 degrees north latitude in the Arctic regions, it thus excels any other bird in its enormous north and south distribution, its habitat covering 156 degrees of the 180 degrees between the two poles of the earth.

A paper of peculiar signifioance was read before a recent meeting of the Zoölogical Society of London and will be published in the Proceedings. It was by Dr. B. F. Nopsca on "The Origin of Flight." After careful comparison of the fore and hind limbs of bats and pterosaurs on the one hand, and birds and dinosaurs on the other, he denies that archæopteryx shows any specialization in the direction of arboreal life or ancestry. His general conclusions are, that pterosaurs and bats originated independently from quadrupedal arboreal forms in which both anterior and posterior extremities, in consequence of the development of a patagium, became primarily equally used for flight and, in consequence, equally unfit for locomotion on the ground. Birds, however, originated from bipedal, dinosaur-like running forms in which the anterior extremities, on account of flapping movements, gradually turned to wings without thereby affecting terrestrial locomotion. This is also the reason why birds became dominant over all the rest of their aerial rivals.

In a Singapore newspaper, W. Strickland of that city reports a spider with most remarkable eyes, brought to him alive from the island of Java. This arachnid is furnished with two large and protruding eyes (in addition to several smaller ones) which usually are dark brown in color like the body of the animal. Under excitement or other cause these will turn suddenly to a bright grass green, and as quickly back to the original color. This change takes place apparently at will and in one alone, or in both eyes simultaneously. No similar phenomenon is known among any other creatures, except this *Attis* family of spiders.

To "A Text-Book in General Zoölogy" (American Book Co.), by Glenn W. Herrick, should have been prefixed "elementary," as it is intended for a first course in that subject. There is nothing novel in contents or arrangement, but there is a judicious selection of facts and the manuscript has been carefully edited for errors. The "especially malignant" feeling which sawfishes are said to entertain toward whales is, however, a myth, as the two creatures in question never come within miles of each other. But slips such as this are minor ones, and if our more advanced text-books could boast of as few errors there would be less need for blue-pencilling directions in giving them out to students.

"Studies in Plant and Organic Chemistry, and Literary Papers," by Helen Abbott Michael, with a biographical sketch, has just been issued by the Riverside Press. The extraordinary career of Mrs. Michael deserves a memorial like this. The volume contains selections to illustrate the scope of her activities and the breadth of her sympathies and interests, and it presents also a fascinating account of the heroic manner in which she met and overcame serious difficulties caused by ill-health. Miss Abbott first became an accomplished musician, devoting to her studies an amount of time and energy which belong only to the strongest constitutions. Afterwards, while not relinquishing her interest in music, she became an ardent investigator of chemical problems and of therapeutics, acquiring in every field she entered new facts, which she promptly contributed to science. And, besides her absorbing devotion to these many subjects, allied and yet diverse, she gave an incredible amount of attention to social and political questions. Added to all this was the earnest study of certain questions in philosophy and literature. In everything she touched she succeeded, and the volume before us is a partial record of some of those successes. Every reader will delight in the frank and charming extracts from Mrs. Michael's diary, which constitute a part of Mr. Dole's biographical sketch. The sketch itself is well proportioned and discriminating, and is thoroughly appreciative of Mrs. Michael's remarkable powers. Every student of plant-physiology will be glad to have in this compact form the scattered papers which, under her maiden name of Abbott, Mrs. Michael contributed to many scientific publications. Among the most interesting of these communications is her study of the "Chemical Relations of Plant-Forms," a subject which she made her own, and in the further investigation of which every chemist must make grateful use of her suggestions.

Drama and Music.

One of the most important theatrical incidents of the coming season will be the production by Harrison Grey Fiske of Percy Mackaye's poetic tragedy, "Sappho and Phaon," which has already been reviewed in these columns. Mr. Fiske is to be congratulated upon its possession. He promises that the support of Madame Kalich, who is to enact the heroine, and the general stage equipment, shall be fully worthy of Mr. Mackaye's creation.

Among other interesting announcements by Mr. Fiske is one to the effect that sooner or later Madame Kalich is to be seen in a new play by Edward Knoblauch, the author of that strong but not altogether pleasant piece "The Shulamite."

According to report Clyde Fitch's new play will be a serious work, in which the author addresses himself to one of those "obstinate questionings" which sooner or later enlist the fancy and engage the attention of every "considerable" dramatist. It is time that Mr. Fitch's abilities were devoted to some more worthy object than the temporary satisfaction of the unthinking crowd.

John Mason, one of the best actors and most highly qualified comedians now to be seen upon the stage, is to play the principal male character in the dramatic adaptation of Tolstoy's "Anna Karenina," which Virginia Harned is to produce.

Only playgoers of the older growth, and not very many of them, have any practical acquaintance with Macklin's once popular comedy "The Man of the World." The central character, Sir Pertinax MacSycophant—written for himself by the famous creator of the modern Shylock—offers extraordinary theatrical opportunities to an actor of the first class, being a bold study of shameless hypocrisy, effrontery, and sycophancy, ending in a scene of tragic intensity. The announcement that this almost forgotten play is to be revived this season by Robert Mantell will excite lively interest among the friends of the older comedy, and doubtless will provoke the curiosity of younger playgoers.

Haydn is universally considered one of the greatest composers, but although he died ninety-eight years ago, no complete edition of his works has ever been printed. As he wrote no fewer than seventy-seven string quartets and 125 symphonies and overtures, and as his music is now seldom heard, because of its simplicity, this is perhaps not surprising. None the less, every music lover who likes to explore unknown scores must be glad to hear that a complete edition of his works is to be brought out by Breitkopf & Härtel. The editors of the Haydn edition are to be Dr. Mandyczewski, Prof. Guido Adler, Dr. Oscar von Hase, and Dr. Erwin Luntz. There will be eighty volumes of some 200 pages each—16,000 pages of music to edit and print, all by one man! The libraries of Germany and Austria have placed their MS. treasures at the service of the editors, and so has the family of Prince Esterhazy, in whose castle Haydn wrote most of his works.

Many things have changed since Haydn's day, but in one thing all periods are ludicrously alike—in their complaints over the decay of the vocal art. "Singing," wrote Haydn more than a century ago, "is almost one of the forgotten arts, and that is why the instruments are allowed to overpower the voices." This is funny, but the following remark, which he made to Michael Kelly, cannot be pondered too seriously: "It is the air which is the charm of music, *and it is that which is most difficult to produce.* The invention of a fine melody is a work of genius."

The MacDowell fund now exceeds $38,000. The committee in charge suggests the advisability of giving concerts at summer resorts in furtherance of its objects, and the suggestion is a good one. Information regarding these objects can be obtained of Mr. Allan Robinson, No. 60 Wall Street, New York.

Art.

AUGUSTUS SAINT-GAUDENS.

Augustus Saint-Gaudens, the greatest sculptor in the history of American art, died at his summer home in Cornish, N. H., on Saturday night. He had been failing very rapidly for a week before his death.

He was born in Dublin on the 1st of March, 1848. His father, Bernard Paul Ernest Saint-Gaudens, was a Frenchman, having come to Ireland from the town of Haute-Garonne, in the Pyrenees; his mother, whose maiden name was McGuinness, was a native of Dublin. When the child was six months old, the family emigrated to America, stopping for three months in Boston, and then settling finally in New York. Here the boy attended public school

till his thirteenth year, when he was apprenticed to a cameo cutter named Avet, a Savoyard, and the first stone cameo cutter in the United States. Saint-Gaudens's relations with Avet were broken in his seventeenth year, when he quarrelled with his master. He was in despair at the loss of his position, but, though Avet begged his parents to induce him to return, he refused, and went to work with a shell cameo cutter named Le Breton. He remained with Le Breton three years. All through the years of his two apprenticeships Saint-Gaudens showed the energy and ambition to study drawing at night, for the first four years attending the classes of Cooper Union, for the last two the National Academy of Design. In 1867 he determined to go to Paris and devote himself to the serious study of art. There, after spending some time in the Petite École, he entered, in 1868, the studio of the sculptor Jouffroy, in the École des Beaux Arts. But he continued to practise his trade of cameo cutting, devoting half his working hours to it. He always, in later life, attributed his success to the habits of faithful labor thus acquired, and would refer to his apprenticeship as "one of the most fortunate things that ever happened to him."

The date of Saint-Gaudens's entrance into the studio of Jouffroy was the year of the Universal Exposition, at which Paul Dubois exhibited his Florentine Singer, which had won the medal of honor two years before at the Salon. This work, breathing the spirit of the Renaissance, led to freedom from the stereotyped and pseudo-classic ideals. Its strong influence on modern sculpture must have been felt by Saint-Gaudens. Jouffroy, though not a leader in the new movement to free the art from its worn-out fetishes, was at least alive to it, and his temperate leaning toward the old conventious could not have failed to impress the value of restraint and formal perfection on a temperament as sure as that of Saint-Gaudens to work its way out to an individual expression. Moreover, many of the brilliant young sculptors of to-day received their training in this studio. Falguière and St. Marceau had quitted it shortly before Saint-Gaudens entered, and Mercié was his fellow student there. His relations with such men as these helped him to find his place in the modern movement.

On the outbreak of the Franco-Prussian war, in 1870, Saint-Gaudens moved from Paris to Rome, where he remained three years. Here he was closely associated with the prizemen of the French Academy, among whom his most intimate friends were Mercié, the sculptor, and the painters Luc-Olivier Merson and Joseph Blanc. His first figures, executed here, were a Hiawatha, which was bought by Governor Morgan of New York, and a Silence, which was bought by another New York patron. He received here also, at the time of the Geneva tribunal, an order for a bust of William M. Evarts. This bust he did not execute, however, till his return from Italy to New York, in 1872. Here he settled, taking a studio on Thirty-sixth Street, which he kept for many years. In 1877 he married in Boston Augusta F. Homer.

On his return to New York Saint-Gaudens received the commission for the statue of Admiral Farragut now standing in Madison Square. Carrying this commission with him, and also a commission for a monument to Gov. Randall, now standing at Sailors' Snug Harbor, Saint-Gaudens returned to Paris in 1878. The Farragut was completed first, and exhibited in plaster at the Salon of 1880. From the appearance of this work his position was assured, and he was besieged by more orders than he could execute. He came back to America, and until within a few years worked in his studio in New York.

An example of the length of time Saint-Gaudens would take in completing a work is the memorial to Robert G. Shaw, commander of the Fifty-fourth Massachusetts Regiment, who fell at Fort Wagner. Saint-Gaudens received the commission in 1884, he finished it in 1896. Of these twelve years only two and a half were spent in actual work. The greater part of the time went in planning and in changing plans. Problems constantly arose in connection with securing a perfect ensemble out of details in themselves satisfactory; and there was also the difficulty of finding models for the many types of faces here represented.

The equestrian statue of Gen. Sherman, Saint-Gaudens's masterpiece, now standing at the entrance of Central Park at the corner of Fifth Avenue and Fifty-ninth Street, also took a number of years to bring to completion. The first work connected with it was the eighteen sittings which Gen. Sherman gave Saint-Gaudens in 1887 for the well-known bust. The statue was begun some time later, and was unveiled in 1904. The history of the Diana that surmounts the tower of Madison Square Garden contains an instance of how much Saint-Gaudens would sacrifice for the right artistic effect. After the statue, eighteen feet in height, was modelled and placed in position, he felt that it was too large. He and Stanford White, the architect of the building, took it down at their own expense and replaced it by the present version. This persistency contributed largely to the perfection of idea and form which he attained.

Saint-Gaudens's custom of working on several commissions at the same time makes it difficult to arrange his works in chronological order. Commissions kept coming fast, and in some instances, notably in the case of the Shaw Memorial in Boston, his ideas matured slowly. Among his most important works are the Lincoln Monument and the equestrian statue of General Logan, Chicago; Deacon Chapin, called "The Puritan," in Springfield; the portrait relief of Dr. McCosh for Princeton University; that of Dr. Bellows, in the Church of All Souls, New York; the monuments to Peter Cooper and General Sherman, New York; the bust of Garfield, placed on a tall pedestal designed by Stanford White, with a figure of America in front of it, Philadelphia; and the Shaw Memorial, Boston. He left unfinished groups for the two pedestals in front of the Boston Museum, to represent Labor and Law. The three figures of each group were to be seated. Law was to be flanked by Power and Religion, Labor by Science and Art. He had also in hand a monument of Phillips Brooks for Boston.

Among his other works may be mentioned the three angels at the foot of the cross for the Morgan monument at Hartford, unfortunately destroyed by fire—a loss which Saint-Gaudens deeply regretted, as he considered them among his finest achievements—and The Peace of God in the Rock Creek Cemetery, Washington. While working on the Lincoln monument he modelled the portraits in low relief of the children of Jacob H. Schiff, and at other times the portraits in the same style of R. L. Stevenson, Miss Violet Sargent sister of John S. Sargent, Miss Lee, Mrs. Schuyler Van Rensselaer, his son Homer Saint-Gaudens, the children of Prescott Hall Butler; also the Hollingsworth Memorial for the Museum of Fine Arts, Boston, the bust of Gen. Sherman, a decorative figure of Diana for the tower of the Madison Square Garden—his only nude, the relief over the main entrance of the Boston Public Library, from which Kenyon Cox designed the library seal, and the medal for the World's Fair of 1893. The low relief portrait of Bastien-Lepage was made in Paris before his return in 1879, and sketches of work afterward executed here were prepared at this time. In the earlier years after this return were produced the angels for the monument in the cemetery at Garrison's N. Y.; those for Mrs. Smith's monument at Newport; the angels in Saint Thomas's Church, designed in collaboration with John La Farge, and destroyed when the church was burned; and the Hamilton Fish monument. The colossal figure of Art in the rotunda of the Congressional Library, Washington, though commonly referred to as by Saint-Gaudens, was modelled from his sketches and under his direction by Tonetti Dozzi. Among his small medallion portraits may be mentioned those of Francis D. Millet, George Maynard, and the daughters of Maitland Armstrong.

Saint-Gaudens's genius has been widely recognized. He was a corresponding member of the Institute of France, officer of the Legion of Honor, received the medal of honor in 1900, Paris, and a special medal of honor in 1901, Buffalo. He received from Harvard the degree of Honorary LL.D., and from Princeton the degree of L.H.D. For the last few years he had been residing at Windsor, Vt.

The April number of *Kokko*, the only Japanese magazine devoted to Japanese art (imported by Brentano's), comes to us in its English form (it is issued in a double edition, the one in Japanese, the other translated into English). Among the more interesting articles is a study of "Oriental India-Ink Painting," as acutely written as if it came from Paris instead of Tokio. Like all Japanese art, this India-ink work derives from China, where it is regarded as the most perfect of all arts because it is a union of caligraphy and painting. Seiichi-Taki, the Japanese critic, demurs at this over-estimation of a form of design which lacks color, although he acknowledges that India ink, when properly handled, has a special chromatic beauty of its own. The article is illustrated by three exquisite reproductions. Another noteworthy paper is on Hiroshige's hand-painted views, also handsomely illustrattd. It contains, however, a curious blunder, due either to the translator or printer: Hiroshige's birth is given as 1585 A.D., whereas he was born in the eighteenth century,

and lived into the middle of the nineteenth. The frontispiece is a reproduction in color of a Chinese painting, the tones being admirably caught.

It is stated that Duveen Brothers have bought the paintings gathered by Rodolphe Kann, of Paris, for £1,000,000. The collection is rich in Rembrandts and other masters.

The Académie des Beaux-Arts has announced the following awards in connection with the Prix de Rome: First Grand Prix to M. Billote, student of Lefebvre and Robert-Fleury; Second Grand Prix to Émile Aubry, student of Ferrier and Gérôme; Premier Second-Prix to Louis Fidrit, student of Gérôme and Bonnat; Deuxième Second-Prix to C. R. Darrieux, student of Cormon, Baschet, and Ferrier.

Léon Caille has just died at Rosny-sur-Seine at the age of seventy. He was a friend of Puvis de Chavannes and Carolus Duran, and one of those who founded the Société Nationale des Artistes.

Finance.

The Causes of Decay in a British Industry. By "Artifex" and "Opifex." London: Longmans, Green & Co. $2.50 net.

The industry under discussion is the fashioning of firearms at Birmingham. The authors are manufacturers of long experience who observe with alarm the decline of the craft and are prolific in explanations of the causes therefor. Birmingham, the only producing centre in the British empire, is described as a suitable district for the trade, where natural resources can be fully utilized, workmen of the highest efficiency secured, and products of the best quality at the lowest cost turned out. Moreover, the industry is capable of indefinite expansion, and is always responsibe to calls made upon it. Yet Birmingham is the only centre of firearms production in the world at which the output is decreasing. Thirty years ago England enjoyed 50 per cent. of the world's trade; to-day her share is not more than 10 per cent., and the tendency is toward further decline.

For this deplorable state of affairs, the authors find an explanation in the stupidity of English legislation, which, if they are to be believed, is aimed, though perhaps unconsciously, at the destruction of British industry. Under the safe shelter of their anonymity, they attack with a wealth of sarcasm and vituperation the English governing class which pursues a desultory study of ancient Greek in youth, and cultivates golf in age, and knows little of the business needs of the empire or of the means for their provision.

Government, according to these indignant critics, has shown its stupidity in a multitude of ways. It has passed acts preventing the export of arms to aid foreign, particularly South American revolutions, when apparently it ought to have encouraged frequent rebellions and squabbles for the benefit of the trade in firearms. It has enacted gun and pistol license laws, which have resulted, so we are plaintively informed, in compelling people who take their own lives, to resort to poison and knives in greater numbers. The English patent law is denounced, and with some reason, because it permits the taking out of a patent without requiring manufacture in England, yet the authors, in discussing the law of the United States, and arguing for its superiority because it reserves for the patented article a market with twice the population and six times the area, overlook the fact that the same defect in the statute exists here, and has interfered with many an American industry. Heavy taxes come in for their share of censure. So far as these increased taxes are the result of increased municipal business, the authors have probably made out their case, but our sympathy for the burdened manufacturer would be more keenly aroused did we not recall that the main cause of the increase in taxation has been these same foreign wars which the authors virtually admit to be desirable stimulants to their business.

But the main thesis of the book is a plea for the policy of protection, for the volume belongs in the library of Chamberlain literature. They contrast the success of the United States and of Belgium as protectionist countries with the helpless situation of Great Britain, utterly unable to secure any concessions from other countries because she has nothing to offer in return, and becoming in consequence the world's dumping ground. They deplore the fact that England is becoming a trading rather than a manufacturing nation, and declare that "a national policy which would rank that as its highest achievement does not commend itself to a true patriot," overlooking the important consideration that commerce is essential to provide England with the raw material, food, and even capital necessary to its manfacturing.

The United States enjoys the distinction of an entire chapter. The growth and success of manufacturing industry here are attributed to three influences: tariff legislation vigorously protecting industries, superior patent laws, and common-sense business methods. The character of our patent legislation has already been referred to. The effect of protection upon our industries requires no discussion here. Suffice it to say that the statement in the book is a mere assertion unsupported by evidence. Moreover, it is, somewhat strange to find writers appealing to the experience of a protectionist country as an example of the way in which to build up foreign trade, just at the time when American manufacturers are clamoring for a reduction of duties to aid them in their effort to open to their goods the markets of the world.

Common-sense business methods have been a powerful influence in developing manufactures in this country, and if we apply this principle to the English situation the whole difficulty with the fire-arms industry in Birmingham can be readily discovered. In fact, the authors time and again convict themselves on their own statements. The simple fact is that the Birmingham maker is producing a high-class weapon, probably the best in the world, for which he asks a price commensurate with its value. He appreciates the superiority of his product and expects everyone else to do the same. He refuses to lower himself by soliciting patronage; he merely sits and waits for customers, who ought to come, but do not. There are two errors in his mental attitude. In the first place, everyone cannot afford an English gun, and in the second place, many do not know what they want or that they want the article at all until they have been persuaded by the clever salesman.

This characteristic British attitude runs through every chapter of the book, and reveals itself in the denunciation of the "cheap imitations" of the German, of the success of the Liège manufacturers, of the treatment by the British colonies of the Birmingham product. The English consular service is roundly abused for its officialism and lack of initiative, yet it but gives expression to the attitude of English manufacturers. One quotation will make this clear:

Possibly British manufacturers have concentrated their attention too exclusively upon the economics of production, ignoring the problem of distribution and giving too little heed to the art of selling. Maybe they should have spared more energy for cultivating the shopmen's art and learned the lesson of assiduity from the American book-agents and the German consuls. None doubt their ability to manufacture; many question their methods of marketing. . . . But everybody knows the British manufac-

turer's attitude; he is master of his craft; he knows what a gun, a machine, a boot, or other article should be, and he produces it. What he produces is what he represents it to be always, and it is the best that he can produce. If buyers want pretty boxes—well, it appears to him to be quaint that they should expect a maker of padlocks to give decorative and board cases away.

The naïveté of this confession is so delightful as almost to baffle criticism. If these manufacturers prefer to remain, as they put it, "beyond the turmoil of squalid industrial life," no one will presume to drag them into the whirlpool, but they can hardly expect a sympathetic reception of their book outside the British Isles, or an endorsement of their oft-repeated assertion that the causes of decline in their industry are beyond the control of the people engaged in the English trade.

The Strength of Nations

An Argument from History.

By J. W. WELSFORD, M.A., formerly Fellow of Gonville and Caius College, Cambridge.

Crown 8vo. Net, $1.75.

This is an argument from history, showing how, in the author's opinion, England built up her greatness by a protective policy, and how her Continental rivals were ruined by adhering to mediæval free-trade, e. g., it shows how the Commercial Treaty of 1786 caused the French Revolution in 1789 and the subsequent Reign of Terror.

TAUCHNITZ BRITISH AUTHORS

The Nation.

NEW YORK, THURSDAY, AUGUST 15, 1907.

The Week.

Blue Monday will acquire a special terror for the Standard Oil Company if every wash-day is to bring a fresh report against it by the Commissioner of Corporations. This week's is chiefly taken up with the discovery that the Standard sells much cheaper abroad than at home. Commissioner Smith's eagerness in announcing this is very like the anxiety of the small boy to run and tell his mother the great news, when he heard that a baby sister had arrived. The American people had suspected as much. When Mr. Rockefeller told them how foolish it would be to interfere with his effort to "conquer the markets of the world," they had a pretty shrewd notion that he wished to bleed them in order to do it. But what a powerful tariff-revision argument Commissioner Smith unwittingly supplies! All that he alleges of the nefarious Standard practice in exacting the uttermost farthing from the helpless American consumer, in order to give the foreigner cheap goods, is as true of many protected manufacturers. It has been proved—nay, admitted—of the Steel Corporation. Now, the extortions of the Standard could probably be little checked by revising the tariff; but those protected industries which hide behind high duties, while they skin their countrymen but sell cheap abroad, could be got at by a Congress or an Administration that dared lay a hand upon the tariff. Yet the President is standing as pat as mum.

Massachusetts appears to be the only State just now in which political enthusiasm is able to defy the hot weather. To the Republican clambake at which Mr. Lodge outlined the issues of the year, the Democrats have replied with an outing at Nantasket, where Henry M. Whitney, the probable candidate for Governor, and other Democratic leaders, paid their respects to the Senator-boss. "Massachusetts has played second-fiddle long enough to the interests of Pennsylvania," said Mr. Whitney, "and if I do not mistake the drift of public sentiment, she desires to be recorded in favor of tariff revision, not years hence, but now." If there is a certain sameness in Massachusetts' campaigning, the responsibility really lies with the Republican statesmen who invented that automatic, interchangeable, indestructible tariff argument that revision is impossible just before the Congressional or Presidential elections, because of the disturbing effect it would have on business, while in the off-years there is no time. Senator Lodge is just as enthusiastic a tariff reformer as of old, his only condition being that such revision shall be conceived and executed throughout by Republicans; but he can see no possible chance to carry out this reform before 1909. In spite of the admission by other leading Republicans that Massachusetts could not have been carried the last time except upon the issue of prompt tariff revision, vague "State issues" are all that the Bay State voters are offered this year. One of these, the abuse of Moran and his following, Mr. Whitney properly characterizes as "not only undignified, but silly," adding of Gov. Guild: "He knows perfectly well, or ought to know, that Mr. Moran and his followers honestly purpose to promote and not to destroy social and business conditions."

Mr. Gompers on the telegraphers' strike is really magnificent. "I know nothing of its merits," he says, but its very declaration "removes from the scope of the inquiry an investigation as to its merits." Therefore, he adds, "we are determined to give the operators our best support." Those, however, who are unable to rise to this height of regarding strikers as infallible, will insist upon asking what are the merits of the strike. Few or none can they find. It appears to have been an unusually causeless and headless strike. Somebody, unauthorized, blew a whistle, the operators went out amid cheering, and then the union's officers began telegraphing each other, "What *are* our grievances, anyhow?" The whole thing was a bad case of mismanagement, even from the trades-union point of view. The men disregarded their own officers. Without any warning, or any statement of grievances or demands, they abruptly quit their work. As if further to forfeit all claim to public sympathy, they induced operators not in the employ of the Western Union to strike, in sympathy. The temporary crippling of the news service, by such means, the very officials of the telegraphers' union regarded as a blunder, and tried to prevent. But the whole strike appears to have been most haphazard, and as much in defiance of the rules of organized labor as of common sense.

The announcement that Congressman Burton of Ohio will not accept again the chairmanship of the House Committee on Rivers and Harbors is an admission by one of the ablest men in Congress of the impossibility of combining activity in the broader departments of statesmanship with continual detailed work upon local concerns. Since Mr. Dingley gave his name to the last tariff law, no Congressional chairman has been more thoroughly identified with the work of his committee than Mr. Burton. He did much to bring system into the appropriations for river and harbor work, which years of eager log-rolling had left in chaos. There are fewer sneers at the "pork-barrel," and less deserved than of old. A member must possess in a rare degree the confidence of his constituents before he can avowedly give his first concern to national and not purely local interests. To be an energetic errand-boy for constituents is still the shortest cut to popularity. The Illinois Congressman, Mr. Rodenberg, who secured the largest sum for his district out of the last public buildings bill, received something very like a Roman triumph on his return home. Mr. Burton, however, has more reason for pride in the fact that the Democrats of his district nominated no candidate against him last year.

The navy uniform is likely to follow before long the rest of the old-time panoply of war. A board of officers has been appointed to recommend changes, and the prevailing opinion is hostile to the present costume. It is held by some officers that the "conspicuous attire" of our seamen has done much to prevent enlistments in the navy. Surely there is nothing in heaven or earth like the sailor suit. Pancake hat, enormous collar, low-necked blouse, and flaring trousers make a uniform that, had it not been made honorable by tradition, would be simply ridiculous. Of course, the reasons which dictated the general changes in army uniforms do not exist to such a degree in the world's navies. No commander of a battleship supposes that he can elude the enemy by dressing his crew in khaki. But the design of the existing uniform is so much better suited to the comic-opera chorus and the small boys in the park than to the men who care for costly, intricate, and dangerous fighting machines, that it will be proper enough to leave it to the other worthy wearers. If clothes make the man, it is hard to see how anything can be expected of the sailor to-day but chanteys, roystering, and hornpipe-dancing.

The important point of the decision of Judge Dowling of the Supreme Court in New York, in the suit of Macy & Co. against the Publishers' Association, is scarcely given in the matter innocently furnished in the press. It is true that the publishers cannot now prevent a department store from selling non-copyrighted books at any price the fancy may dictate, but their right to insist upon a minimum price for copyrighted

books is maintained. It was, indeed, upheld by the decision of the Court of Appeals, and Judge Dowling simply follows that. Books of which the copyright has expired may be treated as so many commodities; and price agreements in respect to them will be regarded as in restraint of trade. But copyrighted books stand on a different basis; and we may add that, as George Haven Putnam has pointed out, it was chiefly about the protection of copyrighted books that publishers were concerned. Judicial decisions on that point are still somewhat confused; it will probably be necessary in the end to take the matter to the Supreme Court of the United States. As the matter now stands in New York, however, booksellers and authors are within their legal rights in maintaining the agreed price for copyright works.

Arrests, as well as civil prosecutions, are expected to follow the report of the commission appointed by the Pennsylvania Legislature to investigate the State Capitol frauds, and lists are published in advance of the men against whom the findings of the board are directed. The list includes not only Contractor Sanderson and Architect Huston, but several members of the extraordinary Board of Public Grounds and Buildings which, with unlimited access to the Treasury surplus, undertook the furnishing of the new State-house. The name of Gov. Pennypacker, whom no one accuses of personal dishonesty, is not there, nor, of course, is that of State Treasurer Berry, who made the first disclosures of Capitol graft. The attorneys for the commission are said to have recommended thirteen criminal indictments, as well as civil suits for the recovery of more than three millions. These proceedings conform to the magnificent scale of the peculations that occasioned them. But so far as any one "higher up" is concerned, the mystery does not seem to be yet cleared up. As Charles H. Darlington says in the current *World's Work:* "These men were not bosses, big or little. They were favored citizens. Why? . . . Either they were simply the agents to draw the money from the Treasury for some of the big fellows, or else they have rendered such service that their profit of millions is only a fair recompense. The investigation will not be complete until one or the other of these things is developed." The question that ordinary legislative hearings failed to answer, however, criminal trials may yet clear up.

Prince Scipio Borghese, the winner of the Peking to Paris automobile race, who drove his machine some 9,000 miles in sixty-one days, will probably not be allowed to retain his record unchallenged for very long. Already a patriotic and adventurous German has announced his intention to drive a motor car across Africa from the Indian Ocean to the Atlantic. The trip is to be taken in an especially designed car, having, it is reported, wheels four feet in diameter, with enormously wide tires. This raises the rather interesting question, When is an automobile an automobile, and when is it a steam-roller? It is the inevitable result of all attempts to make new inventions do what the laws of nature intended them not to do, that they really lose their identity in the endeavor, and so frustrate our essential purpose. The snowshoe, in order to permit walking on the surface of the water, has to be made so impervious as to become practically a canoe, and so heavy as to make walking on the surface of the water nearly always impossible. The field of domestic economy, as expounded in the household magazines, offers numerous instances. An egg-box writing desk can probably be constructed, but only after subordinating the original egg-box to the added material in the ratio of one to one hundred, and consenting to do most of our writing on the dining-room table. The "specially-constructed" monstrosity, whatever it be, is to the standard article what the professional spirit is to the amateur spirit in athletics.

The airship, like the automobile, is bound to arouse exaggerated hopes for a long time to come. Thus an eminent German military critic protests against the Utopian Jingoes who are beginning to call for fleets of dirigible war balloons as the most suitable means for conquering Britain's girdle of invincible insularity, overrunning France, establishing a world-dominion, etc. This critic points out that the war balloon is still in its experimental stage; that it rises with difficulty and lands with still greater difficulty, and that at the height of a mile and a half it can be assailed with gunfire from the ground. Nevertheless, Germany rejoices at the fact that she has wrested from France the advantage in "air-power" which the latter country has held for a number of years. Even the military statistician who figures you out the fate of battles in advance by balancing knot-speed against knot-speed and weight of broadsides against each other, has turned his attention to the new field. He has discovered that, inasmuch as the French war-balloon La Patrie was up in the air for three hours, while the German ship floated for three hours and a quarter, Germany has a preponderant strength of thirteen as against twelve. It is now open to the psychological-factor school of martial accountants to reply that the French, being an imaginative and even flighty nation, are really stronger in the air than the mere figures would indicate. We await with interest the rise of other "schools" of opinion on aerial warfare —the triple-plated, two hundred-ton aeroplane school, the high-speed, screw-driven, commerce-destroyer school, the cigar-shaped torpedo-boat school, etc.

The outcome of the recent elections for the partial renewal of the *Conseils généraux* in France has been to strengthen the position of the Government and of the policy of "republican defence." The decline in strength of the conservative and reactionary parties steadily goes on. Definite results for 1,298 seats out of the 1,450 that were to be filled show a decrease for Conservatives and Nationalists from 299 to 263, and for the Progressives or conservative Republicans from 184 to 137, but an increase for Radicals, Radical-Socialists, and Socialists from 815 to 898. If these figures may be taken as indicative of the sentiments of the entire electorate, the Government's supporters can be estimated at more than two-thirds of the nation; while if we make the issue one between republicanism and anti-republicanism the former is in a majority by about four to one. The Liberal press takes the elections as a text for emphasizing the permanence of the Third Republic and for insisting that the time has come when Parliament, no longer beset with the fear of monarchist reaction, shall proceed to legislate for the country in a spirit of broad statesmanship. The only source of regret has been the sullen attitude of the disconsolate Midi. Of the three wine-growing departments, Aude witnessed a general strike of voters in ten out of sixteen districts; Pyrénées-Orientales, in one out of eight, and Hérault (containing Montpellier-Béziers), in twelve out of eighteen. Yet the Republican cause encountered no setback; on the contrary, the only Conservative seat in the three departments voted for was captured by a Radical.

There is martial law in part of Ireland, but, strangely enough, it is not Nationalist Connaught or Munster that feels the increased burden of the Sassenach, but Belfast, in Ulster Orangedom, and a stronghold of the Unionist Ascendency party. With the troops patrolling the streets, the conditions in the strike-vexed city are not pleasant to contemplate, either for the Irish Loyalists or the Liberal Ministry. The possibility of actual conflict between the strikers and soldiers is not remote. Should untoward incidents result, public opinion will not go entirely against the members of the Irish constabulary, who have real grievances to complain of. The Nationalist parties of the south ought to regard the Belfast crisis with extreme satisfaction. It not only worries their enemies, the Loyalist M.P.'s, but may not improbably bring them an important accession of strength

among the working population, sufficient to break the Unionist parliamentary phalanx of Ulster. As a matter of fact, of Belfast's four seats in Parliament, one was captured by a Nationalist in January, 1906, with 4,138 votes, against 4,122 for his Unionist opponent, while another went to a Unionist by less than three hundred majority over the Labor candidate.

In the Moroccan situation one fact would seem to stand out clearly—that German diplomacy has little reason for congratulating itself on the outcome of the policy initiated by the visit of the Emperor at Tangier in 1905. Kaiser and Chancellor must now be bitterly aware that the series of events then set in motion has resulted only in advancing the fortunes of France in Morocco by a decade or more. At present, it is best not to qualify "fortunes" either as good or evil, for time alone will show whether the reduction of Morocco to a French protectorate will repay the cost of such a venture. But, taking it for granted that what the French want is the best for them, their advance in Morocco has now been enormously accelerated. Under the old policy of "pacific penetration," fostered by M. Delcassé, years must have passed before the process of territorial encroachment on the Moroccan hinterland from Algeria and diplomatic pressure at the ports and capital would have precipitated a crisis like the existing one. That the present situation has followed logically from Franco-German strife in Morocco, there can be little doubt. On the one hand the native tribesmen have been stirred to active hostility by the virtual subjection of the Sultan to general European control. On the other hand, they have probably come to believe that in a war against the French, sympathy would not fail to be forthcoming from certain European quarters. But whereas two years ago France, if attacked, would have appeared in the light only of a greedy invader, she holds now the enviable position of acting as the mandatory of Europe. That the crisis will end as it began, with Casablanca, is scarcely possible. Disorders have been reported in other ports. Tangier is declared to be in immediate danger. It is probable that the Clemenceau Cabinet views with no light heart the beginning of an adventure which, if carried through to the end, must prove much more costly than Madagascar, if not than Algeria. Like the latter, Morocco has a population of 3,000,000 Arab nomads, with no lack of prophets and minor Abd-el-Kaders to head a holy war. But Morocco has also a Berber population of some five millions, three times as large as Algeria's; and the conquest of Algeria took twenty years.

There is a kind of periodicity about the reports of activity among the anarchists. Just as they begin to be forgotten, their press agents announce new plans. This month, for example, a convention is to be held in London, with delegates from the Russian Social Revolutionary Party, which contains a fair sprinkling of anarchists. Until lately, these people had their headquarters in Geneva, but were forced to emigrate on account of stringent legislation against them in Switzerland. After reorganizing and strengthening their party, they hope to work more openly and systematically. They will rent a building for headquarters, and will have a printing press of their own from which will issue the papers and books of their propaganda. Most of these wandering social and political fanatics are personally harmless. If they do no good, they do little evil. They are indirectly dangerous, however, by furnishing suggestion and provocation to the ill-balanced enthusiast and the criminal. Geneva is glad to be rid of them, and London will have to watch them.

In his recently published "Secret History of the English Occupation of Egypt," Wilfrid Scawen Blunt tells a weird story of the English representatives at the Berlin Congress. He got the particulars, he says, from a letter written to Lord Lytton at Simla in May, 1879, by a diplomatic colleague who was in Berlin. When the representatives of the Powers assembled, each one was asked to declare that his Government was bound by no secret agreement. Disraeli and Salisbury having been engaged in secret negotiations with the Sultan, were much embarrassed; yet, says Mr. Blunt, "they had not the presence of mind to refuse, and no less than the others formally agreed"; but, he adds, "it must be remembered that both were new to diplomacy." A few weeks later, the text of the private convention concerning Cyprus was published. "Our two plenipotentiaries," says the author, "found themselves confronted with the unexplainable fact that they had perpetrated a gross breach of faith on their European colleagues, and stood convicted of nothing less than a direct and recorded lie." This treachery promised to break up the Conference. Gortchakoff and Waddington threatened to withdraw. The awkward situation was relieved by Bismarck, who had a liking for Disraeli. A compromise was reached by his intervention. Mr. Blunt brings forward no documentary evidence in support of his assertions, and there is a wild improbability about the whole story. Beaconsfield's enemies have often accused him of trickery, but no one has ever thought him a fool. Such *Tendenzschriften* as Mr. Blunt's make amusing reading, but it is not of such stuff that history is made.

New Zealand's Legislature is about to undergo an important transformation through the substitution of an elective Upper House for the present Legislative Council nominated by the Crown. When the process is completed, the New Zealand Parliament will be unique among law-making assemblies. In the first place, the new upper chamber is to be chosen by the House of Representatives. This is an unusual provision in itself, the nearest resemblance being found in France, where the Deputies from every department form part of the electoral assembly that elects the Senators for that department. In New Zealand, women are to be qualified for election to the Upper House, in spite of the fact that they are not eligible to the House of Representatives—an anomaly that grows more striking and more confusing when we find out that they are entitled equally with men to vote for members of the lower chamber. In other words, in the series of three sets of qualifications which lie between the franchise and a seat in the Upper House, women hold the first and third, but not the second. It is conceivable, however, that an influential feminist leader might strike a bargain whereby, in return for supporting a male candidate for the lower chamber, she would receive his vote for a seat in the Upper House. Evidently, the men of New Zealand have not been able to free themselves from the old notion that woman's influence is best exerted in indirect ways.

In his presidential address before the British Medical Association, Dr. Henry Davy discussed "Science in Its Application to National Health." He pointed out the practical bearing of Darwinism on hygiene. Darwin showed "that the only way to maintain any organ or structure of the body in its proper condition of health and development is by a proper and adequate use of it." Consequently, exercise is of vast importance to racial development. We have heard a great deal about the difficulty of recruiting the English army; Dr. Davy finds the cause of physical deterioration in the fact that villages are decaying, while great factory towns are absorbing the population. Easy transportation makes walking less necessary. Labor-saving machines cause disuse of muscles. "Physical culture," said the doctor, "is one of the most pressing questions of the day, for it is the only means of providing a remedy for the prevalent muscular degeneration." Athletics by proxy and sport at one's ease are rapidly exterminating, thinks this doleful observer, that stalwart product of a roast-beef diet which Taine admired, if he did not envy.

BRYAN AND THE SOUTH.

Signs of growing dislike of Bryan in the Southern States, if not of an active movement to prevent his nomination, are of great political significance. Bryan without the South would be shorn of his power. Without the support of the Southern delegates, he could not control the National Convention; while the loss of the electoral votes of one or two States south of Mason and Dixon's line would make his election, if nominated, impossible. Hence the interest of the question just what is the extent of the anti-Bryan sentiment in the South to-day.

It has doubtless been somewhat exaggerated. Certain travelling newspaper correspondents have tried to make it appear intense and universal. It is not that; but no one can talk with representative Southern men, or read Southern newspapers, without discovering a new attitude towards Bryan; if not hostile, at least no longer friendly. It is not often that one comes upon so blunt an expression of it as in the Mobile *Register*, which says that the Democrats "will have to dump Mr. Bryan." Frequently, however, one finds a tone of marked coldness, with the unconcealed hope that some way may be devised of avoiding another Bryan candidacy. The Houston *Post* remarks that to nominate a man of Mr. Bryan's views would "sacrifice the independent vote," and it adds that, without it, "success will be impossible." That is not what Mr. Bryan would call enthusiastic support. Nor would he be elated by such a chilling utterance as that of the Savannah *Morning News*, which unfeelingly declares: "Here in the South there is a very large number of prominent Democrats who do not think Mr. Bryan would stand much chance of being elected."

When we come to ask for the cause of this remarkable change of feeling in the South, we are not left long in doubt. It is Mr. Bryan's pronouncement in favor of Government ownership of railways that has brought about the revulsion. This has been due, partly, to a sound economic and political instinct. The South still shrinks from paternalism in government—when it doesn't want it. But the chief reason why the South dreads Government ownership of railways is that it might interfere with one phase of dealing with the race problem: in a word, that a Federal law might prevent discrimination against colored passengers. This is frankly stated by the Charleston *News and Courier:*

> It is not with the feelings of Mr. Bryan toward the South, which are undoubtedly friendly, that the South is concerned, but with the sure results that his policy would bring about.
>
> His declaration in favor of Government ownership as an ultimate solution of the [illegible]ation question is loaded with ultimate and certain peril to the white race in the South. It should therefore remove Mr. Bryan from further consideration as a possible candidate for President in the minds of those Southern Democrats to whom white supremacy is a matter of some importance.

It is really a poetic retribution which has overtaken Mr. Bryan in this particular. In behalf of the negro he has never publicly raised his voice. Effusive and emphatic he has been in declaiming against the wrongs of the Filipinos, Armenians, Macedonians, and we know not what other oppressed peoples; but negro disfranchisement in the South has never drawn a syllable of protest from him, nor have all the prejudice and hampering and abuse to which black men, purely as such, have been subjected. This has been a strange limitation in a man who professes sympathies as wide as humanity. Mr. Bryan's silence about the injustice done a whole race has made it appear that his expansive benevolence was fettered by a keen perception of his own political advantage. And it is clear that he never dreamed how his plan of Government ownership would strike upon the race obsession of the South. That was only one proof more of his having rashly spoken without duly weighing the consequences. But there is something almost comic in the spectacle of a man who has been content to let the South do what it would with its colored citizens, suddenly discovering that he had gratuitously blundered into treading upon its susceptibilities and arousing its fears.

It may be said that Mr. Bryan's renunciation, shame-faced and half-hearted though it was, has removed the offence. But the South does not think so. It sees the fallacy and peril of his distinctions between "immediate" and "ultimate" issues. On that point, the Wilmington (N. C.) *Messenger* says with much directness:

> We do not think the South will stand for the later political principles Bryan has announced. The fact that he has modified his Madison Square Garden declaration in favor of Government ownership of railroads by saying that it is not to be made an immediate issue, shows that he has found public sentiment in his party against him at present on that proposition. The people, however, know his views on that question and they will not be fooled into supporting him on this recent modification thereof by his declaration in favor of postponing the time for putting the principle into effect. We do not believe a majority of the Democrats of the South want Bryan for President and we are sure that if nominated he will lose some of the States which Parker carried.

All this is far from proving that the ferment against Bryan, now evident in the South, will be fatal to his candidacy. There is, as yet, no organized movement against him. It is doubtless true, as the Nashville *American* asserts, that the South could make its opinion effective in the National Convention, provided it were backed up with "a solid delegation." But about whom is that delegation to rally? So long as that question is unanswered, Mr. Bryan has not much to dread. It is reported that he will make speeches in the South, during the autumn. By that means he may at least seem to win back the Southern support which is so absolutely essential to him. But as the case stands to-day, the South is undeniably ripe for revolt against him. Nothing is lacking but the occasion and the leader to make it a triumphant revolt.

FRIGHT AT SOCIALISM.

Recent political events in England have sent fresh shivers down the backs of those whose flesh is habitually made to creep by fear of Socialism. In the bye-election at Colne Valley, an out-and-out Socialist was returned to Parliament. It was a supposedly sure Liberal seat, yet there was a three-cornered contest, and the Conservatives hoped to slip their man in between the warring Liberals and Socialists. In fact, the Tories had been chuckling over the way in which the Liberal party was threatened with a break-up, by the desertion of its Radical allies, and were figuring on a great increase of their own vote. Unluckily for them, it fell off decidedly at Colne Valley. They had the chagrin of seeing many of their own followers voting for a Socialist. The effect was most depressing upon a certain order of Conservatives. One grizzled Tory colonel, who had faced Boer bullets undaunted, was thrown into a panic by the election returns from Colne Valley. They portended the total overthrow of society. "We shall live," he said, "to see the guillotine set up in Trafalgar Square."

Pending that interesting historical event, it is instructive to look across the Channel and see how Continental statesmen are facing the Socialist peril. The French journalist, Jules Huret, printed lately in the Paris *Figaro* a long and authorized interview with Chancellor von Bülow at Norderney. The conversation turned to the outlook for Socialism in Germany. Did it not contain a serious menace for the Empire? Prince Bülow thought not. His reasons were, not simply the loss of seats by the Social Democrats in the last elections to the Reichstag, but the further fact that, out of their 3,000,000 voters, not more than 500,000 were convinced Socialists; the rest were merely discontented, or men who simply took the Social-Democratic party as a convenient weapon wherewith to deal the Government a blow. There is doubtless much truth in this. The Chancellor went on:

> The Socialist leaders are as dogmatic theorists as anybody in the Middle Ages. You recall the famous debate at Amster-

dam. Jaurès said to Bebel: "You have eighty-four members of the Reichstag, and it is as if you did not exist. You do nothing. Not one of you is in office. You are powerless to pass the smallest Socialist law." And Bebel retorted that the French Socialists were unable to pass even the bill for taxing incomes. In all this I see a proof that there is no such thing as the Socialist danger, provided that the Conservative and Liberal parties know enough to stand together in all action for social defence.

These two points of view, the English and the German, have often been duplicated in this country. We have frequently seen these ups and downs of apprehension about Socialism. Mayor Dunne was elected in Chicago, in 1905, and timid people told us that Socialism was going to "sweep the country." If all such predictions had been verified, the country would have been well swept by now. In 1907, however, Mayor Dunne is defeated, and old ladies of the male sex sleep easily again, and thank God that the Socialist peril is over. But they now see it looming again in consequence of the acquittal of Haywood. His counsel at Boisé preached the social revolution; and dire visions have afflicted many. They have seen, if not a guillotine erected in Trafalgar Square, at least a Socialist tax-gatherer taking away all their property.

A little of the philosophy of Mr. Dooley would reassure these anxious souls. That political observer had seen in his lifetime a succession of the most wonderful events—each year a political revolution, the country convulsed, Archey Road set rocking; yet when he looked back fifty years, it seemed as if "nawthin' whatever had happened." This is not merely the flattering assurance of the conservative, cased in fat, who says to himself that all things remain as they were. It is, rather, the clear perception of the truth that great political changes are wrought slowly; that human nature is the constant factor with which all innovators have to reckon, and that human nature does not essentially change from generation to generation.

There is no sound reason for being afraid of Socialism. It has doubtless come to stay in the political world, as it always has been in the world of political speculation. It will have its times of ebb, and its times of flow. Men of warm benevolence will adhere to it, as will youthful enthusiasts. It will also continue to number embittered men among its supporters, with social levellers of all kinds. But it can never abuse any political power which it may win, without at once provoking a reaction, and a union against it of the kind Prince Bülow describes, and so defeating itself. And, as every fair-minded student of our public life must admit, the Socialist party has its lessons and its warnings for other political parties. It has a programme both idealistic and utilitarian, and is a standing rebuke to those partisans who think of offices as a good in themselves, not as a means of doing the public business efficiently and benefiting the community. No sensible man will let Socialism alarm him; but if it can teach him anything, why, what is he here for except to learn? As between Bourbon and Socialist, the choice might not favor the former.

INDECISIVE RAILWAY CAMPAIGNS.

It is doubtless generally considered a vindication of the policy of securing low passenger fares by direct legislative action, that so many of the railways affected by the two-cent fare and similar acts of this year have announced that they will "obey" or "accept" the new schedules. The multitudes of people who are riding now, or will ride presently, for a cent per mile less than of old, will feel as though the points at issue were settled in an absolutely satisfactory way.

Yet to any one who looks beyond the interest of the moment, the real significance of the present situation must be found in what we may call the "loose ends" of the low-fare issue. There are many localities in which the questions at stake cannot really be called settled. In Alabama, the two and one-half cent fare, together with certain reduced freight schedules, goes into effect only pending judicial determination of the railways' Constitutional rights. In North Carolina the two and one-quarter cent rate went into effect last week, but with Gov. Glenn's promise that, if it proves too burdensome, he will call a special session of the Legislature to repeal it. Though a dispatch from Wisconsin last week stated that the roads of that State would not contest the two-cent-a-mile rate to go into effect on August 15, yet it now appears that they submit under protest, and the roads may carry their case into either the State or Federal courts whenever they see fit. In another Western State the roads, under a court order, are giving the new rates a temporary trial, with a view to obtaining data on which to determine later the reasonableness of the new rates. Thus in various ways the passenger fare situation is seen to be still confused and unsettled.

A problem like this can never be called settled at all until it is settled right; yet one of the most patent facts about the two-cent-fare laws was that they could not possibly be right for all the diverse States which passed them. If the favorite rate is fairly remunerative in the West, it must be too high in the thickly settled Eastern States; if it is a just rate here, it must conversely be too low in the West. There has been some effort, it is true, to make allowance for conditions. A few of the new laws deal in fractions of a cent, while several bear lightly on short lines as roads of small profits. But in general, our legislatures have followed the precedent of Procrustes. Even though some of them hit upon a rate which is fair and will stand scrutiny, it has been partly due to accident.

The case of Wisconsin, though it has attracted less attention than those of the South, is in some respects the best illustration of the effects of the low-fare obsession. Wisconsin was one State that did have reason to know what was a fair rate. The State Railroad Commission, a body in which there was general confidence, had studied the subject at great length, and concluded that two and one-half cents was a fairly remunerative passenger rate. There was a common belief that, as soon as the increased passenger business of the Wisconsin roads warranted it, the Commission would order a second reduction. Mileage books, in fact, were already being sold at the two-cent rate.

The Legislature established the reduced rate, not because it learned anything about its fairness, but because the Legislatures of neighboring States had done so. Even Gov. Davidson, in signing the bill, stated that he did so not so much because the rate itself was abstractly right, as because the railway companies had subjected Wisconsin shippers and passengers to unnecessary vexation and discriminations under the former law. The chairman of the Commission whose deliberate judgment had been thus overriden, promptly resigned his office, and it is worth noting that a majority of the legislators who had been most active in the movement to create the rate-commission so long urged by Gov. La Follette, opposed stoutly this year the proposal to set aside its decision.

The events in these other States have abundantly vindicated Gov. Hughes's veto of the two-cent-fare bill in New York. While it is, of course, possible that some radical Legislature will deal as cavalierly with our Public Utilities Boards as that of Wisconsin has done with the commission it created, yet it is altogether likely that the warning signals will be plainer a year from now than they are to-day. The States which have gone recklessly into the business of rate-fixing may find themselves in a worse position than when they began, morally if not financially.

New York has such an opportunity as rarely comes to any commonwealth for leadership in the intelligent regulation of public service corporations. We have seen many other States set out upon principles that were wrong, if well-intentioned; we have seen some that started out in the right way break down in the working out of their policies. The Government ownership advocates, of course, insist that since mere "regulation" is bound to fail in any case, there is really no great choice between slap-

dash and painstaking methods. But this is not the general view. We think that the local Public Utilities Board has shown a proper appreciation of its duties by its investigation of the very fundamentals of the local traction problem, securing operating officials' testimony even to facts of the commonest knowledge. A series of decisions based on so solid a foundation of fact that the people will recognize their justice, while the companies affected will not be left a reasonable pretext for refusing obedience, will do more than any other one thing to clarify and moderate the disturbed sentiment of the day, in all these matters.

PHASES OF ACADEMIC FREEDOM.

A Rockefeller professor, according to newspaper report, has just made an open attack on Rockefeller. Prof. Charles Zeublin, of the University of Chicago, in a public lecture, is alleged to have criticised sharply the founder and fosterer of that University; to have said that the defence of the Standard Oil Company, in the recent trial, was "weak and cowardly"; and that "Mr. Rockefeller and other Trust magnates are doing more to make Socialism possible than are its most zealous adherents." So many fantastic tales have been printed about utterances of Chicago professors, that we place little faith in this particular story. But the report, whether well-founded or not, suggests certain reflections in regard to academic freedom. With the truth or falsity of the assertions attributed to Professor Zeublin we do not at present concern ourselves. If any one cares to know our opinion, we may say that we think them substantially true. But their utterance by a member of an institution which lives by grace of Rockefeller raises a serious question of academic ethics. Is it proper, is it desirable, that a university should take a man's millions, and then allow one of its professors thus to assail him?

This is a question which President Eliot recently touched upon with his customary fine moral discrimination. In his address before the Phi Beta Kappa Society of Cornell on Academic Freedom, he asked: "Ought the opinions and wishes of a living benefactor to influence the teaching in the institution which he endows?" His answer was, as a general proposition, in the negative. Teaching which is not free, and not known to be free, is worthless. At the same time, Mr. Eliot insisted that benefactors have "certain rights in this respect." The common principles of fair dealing apply:

> They may fairly claim that their benefactions entitle their opinions and sentiments to be treated with consideration and respect, and not with contumely or scorn, in the institutions they have endowed, or by the professors whom their gifts support. If their benefactions are for general uses and not for the support of any specific courses of instruction, they may fairly claim that subjects likely to be taught in a manner repulsive to them should be omitted altogether, unless some serious public obligation requires the institution to include them.

Such a view is not the popular one, at the present day. The multitude sees no impropriety in taking a man's money, and then endeavoring to make his name a hissing. And many university men would cry out that President Eliot's position is subversive of academic freedom. But this tempts one to exclaim: "Oh, Academic Freedom, what indecencies are committed in thy name!" There are certain elementary rules of propriety governing the intercourse of men, and even the behavior of institutions, and these existed prior to any notions of *Lehrfreiheit*. It simply is not morally decent to accept a gift and then abuse the giver. The way to preserve academic freedom is to refuse any endowments which may impair it. Once the money is taken, an obligation goes with it to treat the giver with ordinary courtesy. Academic freedom, as President Eliot shows, is at best imperfect. It is limited, in fact, by many and differing considerations. Certainly, it is but fair to limit it by the general rules which ought to control the attitude of a beneficiary to his benefactor.

Objectors fail to see that one's free action may restrict his freedom. It is not necessary for a university to accept funds from a citizen whom it considers undesirable. Academic freedom to refuse it is entire. The moment, however, the money is in its treasury, the university is bound to do what a man of due sensibility would under the circumstances. It cannot at the same time be grateful and vindictive; cannot accept a man's purse, and then beat him over the head with it. But how about the poor professors at Chicago? Are they to be forbidden to rail at Rockefeller? They surely were not parties to the tacit bargain between him and the institution. Yes; but they accepted their positions with their eyes open. If their academic freedom is hampered, it is by their own voluntary act. It is evident, moreover, that aside from the point of etiquette, little or nothing is gained when a professor at Chicago discusses Mr. Rockefeller. If the professor praises, he is generally accused of toadying; if he blames, he is suspected of trying to create a sensation and advertise himself. In the very nature of the case, his words are rendered null. His situation is not unlike that of clergymen who wish to attack the creed of the church which they have vowed to maintain. They are at perfect liberty to speak their minds, but not in the pulpit of that church. If Professor Zeublin burns to hit out at Rockefeller, the country is full of stumps and platforms and newspapers where he can do it to his heart's content; but it is neither seemly nor useful, in our opinion, for him to do it as a Rockefeller professor.

Liberty of teaching is a precious thing, anxiously to be preserved. The late Ferdinand Brunetière put an exalted value upon it. A lecture of his on "La liberté d'enseignement" has lately been published by some of his friends. In the course of it, Brunetière thus stated the ideal position of the ideal professor:

> I am here neither as delegate, representative, nor mouthpiece of any party, coterie, or league. I do not dream of either changing the form of government, revising the Constitution, or even upsetting the Ministry. These may be useful things to do, but they are not within my province. Besides, what can a change in persons or in manners lead us to, if we have not first changed opinions?

That conception of the liberty of the true teacher is one that ought to be prized by everybody and jealously protected. But it is a liberty which may have to be bought with a great price—even the price of declining gifts which, once taken, necessarily cut into its fine independence.

TRANSMUTATION OF THE ELEMENTS.

Cablegrams from England recently intimated that the transmutation of the chemical elements had been accomplished by Sir William Ramsay. Many modern chemists have believed that one of the so-called chemical elements could be changed into another, but that belief had not been substantiated by actual experiments, reported by observers of scientific acumen and accepted integrity. Hence the telegrams were doubted; but the English journals of science, subsequently received, show the general accuracy of the press reports. At the annual meeting of the British Association there was a lively discussion of the nature and origin of the chemical elements. In the course of it, Sir William Ramsay stated the results of numerous experiments undertaken by him in recent years.

According to a tacit agreement among chemists, an element is a substance which, although it may be a constituent of a large number of more or less complicated bodies, has itself not been decomposed into anything else. For instance, sodium is a constituent of common table salt, cooking and laundry salt, Glauber's salt, borax, waterglass, and many other substances, but it is regarded as an element. Every element is characterized by two apparently definite qualities. It has a definite atomic weight or equivalence, and it has never been known to enter any compound in less proportion than that equivalence.

For example, sodium is twenty-three times the weight of hydrogen, which is the lightest known element, and for that reason is placed at unity. Sodium may and does enter into compounds as forty-six, sixty-nine, etc.; multiplies, in short, but never as a fraction of twenty-three.

An element is also characterized by a definite spectrum. About forty years ago, Jannsen, and later Lockyer, recognized characteristic new lines in the light from the sun's chromosphere. This was attributed to an unknown element, helium, definitely found in certain mundane minerals by Ramsay thirty years later. Preceding the latter discovery, this Scotch chemist, in collaboration with Lord Rayleigh, found that the air contained a hitherto unrecognized constituent to the extent of one per cent. It was called argon. Three other accepted elements of the same general character as helium and argon have been found in the air, but in very small amounts, a few parts to the hundred million. Scientific men have so far failed in causing any of these five elcments to form any compounds.

During the same year that the last three of these elements were discovered, an intrepid Polish woman and her husband, Professor Curie, in Paris, traced out the elusive but remarkable radium—a substance so marvellous that we have not as yet secured a satisfactory description. It is an element in that it possesses a definite atomic weight and distinguishing spectrum, but it is unique in many ways. It maintains itself at a temperature constantly above its surroundings; it charges bodies electrically and discharges bodies already charged; and it constantly gives out a gas called "emanation" by its discoverer, Rutherford. This emanation, left alone, gradually changes, step by step, into helium. If this be a genuine change, and experimental observation indicates that it is, then we have the transformation of one element into another, or transmutation.

Conservative scientific men, among them Lord Kelvin in England, and Professor Baskerville in this country, maintained that, if there were a change, then by definition we have no right to regard radium as an element. As this view was gaining adherents, the results of Professor Ramsay's experiments were announced, and a new physico-chemical conception of matter was presented. The value assigned to radium in the atomic weight tables is third from the highest. By many workers and thinkers, it is regarded as a decomposition product of uranium, the element of the greatest atomic weight. The helium produced has a weight next to the lowest. During these changes immense amounts of energy are given out—immeasurably greater than that produced during the most violent chemical activity with which man is familiar. Radium compounds give off under the ordinary conditions the emanation which changes to helium. According to Ramsay, the emanation in the presence of water produces neon, a member of the helium group; in the presence of copper compounds, like copper sulphate or nitrate, argon, also a part of that family. One of these is five and the other ten times as heavy as helium. Why the change does not continue is not explained. Nor why these substances obtained from other sources do not change into helium is not made clear. Doubtless, these points will receive most careful scrutiny by scientific men, who will at once reject or accept the new paths opened up for the pioneer.

The most remarkable observation, however, had to do, not with these inert gases, but with the liquid left behind. When the copper was removed from the solution, lithium was detected in the residue. This was not the case when a similar solution was taken before treatment with the emanation. One of the chemical families, so classified on account of certain resemblances, contains among others copper, silver, gold, and lithium. The last-named is the lightest member. The natural conclusion is that copper, nine times as heavy as lithium, has been "degraded" into the light element through the agency of this surcharged instrument, the emanation.

Roger Bacon maintained that the transformation of copper into gold by purification was absurd. That constituted only one step toward "perfection." The purest gold was that found in nature; it was so, because in it nature had finished her work. The base metal was to be purified as far as possible, but then something was still wanted, the "philosopher's stone," a pinch of which, when added, would effect the complete imitation of nature. Can this "emanation" be the "philosopher's stone" reversed? Those in this country who know, and have been at work on the problem, think that it is unlikely; but Ramsay's successes have been largely due to the investigation of the unlikely.

NEW MEMOIRS OF THE REVOLUTION.

PARIS, July 31.

Those who are willing to read many books will soon be able to know what really went on during and after the French Revolution better than those who lived at the time. Everything—letters, diaries, family papers of the day, written not for the general reader, but sincerely as the occasion presented itself—is coming to the light of print.

The "Journal inédit de Madame de Marigny," to which have been added the daily notes of the British T. R. Underwood (1814), is a good example. Madame de Marigny was the youngest of the four sisters of René de Chateaubriand. In her own family, and among the Malesherbes and other families with which she was allied by marriage, the guillotine reaped a plentiful harvest of heads; and Napoleon was not clement to them. These diaries cover the time of the final rebound, when the Bourbon restoration was beginning. We see in them the curious apathy of victims with nerves dulled by measureless and irretrievable disaster; there were still cakes and ale in the world. J. Ladreit de Lacharrière has edited the Journal with an Introduction and notes; and Henry Houssaye of the French Academy, the great authority for the years of Napoleon's downfall, gives a Preface.

A similarity of name should not lead to confusion with another book of personal documents, "Madame de Souza et sa famille—les Marigny—les Flahaut—Auguste de Morny (1761-1836)." The Baron de Maricourt has here gathered together the highly anecdotic history of a less tragic and more aggressive family than the Chateaubriands. The names of Flahaut and Morny enter notoriously into the history of Queen Hortense and Napoleon the Third, and by marriage into that of the English peerage of Lansdowne.

"L'Architrésorier Lebrun—Gouverneur de la Hollande (1810-1813)," by the Marquis de Caumont La Force, furnishes the sober historian with means of estimating at their real value the prodigies of systematic financial administration inaugurated by Napoleon wherever his power extended.

The Paris court records of the years of Revolution were destroyed in 1871, when the Commune burned the Palais de Justice. It was known that the courts sat imperturbably, with judges and lawyers trying cases according to all the subtleties of laws old and new, while the administrative tribunals were sending their wagon-loads of victims to the guillotine. It was thought these precious judicial documents—*Archives du Greffe*—were totally lost to history. It now seems that the elder Casenave, who was counsellor and presiding judge in Paris from 1852 to his death in 1869, had used his leisure in studying and annotating them, copying with a lawyer's professional instinct the principal judgments. These notes in their turn disappeared; but they have quite recently been found and edited by one of the most competent specialists of the legal history of the Revolution, M. Douarche, counsellor at the Court of Cassation. The whole is now published in three volumes and forms a judicial chronicle reaching from 1791 to 1800—a part of the Revolution seen at close range.

For the first time we have here an exact account of the Latude trials. Latude, as a man and as a victim of the old régime, has been greatly discredited in recent documentary history. Still, it was the story of his long imprisonment which more than anything else stirred the Paris populace to the taking of the Bastille. Latude, an old man of sixty-eight, took advantage of the downfall of the monarchy to sue for damages the heirs of Madame de Pompadour and the still living minister of Louis XV., as responsible for his confinement of thirty-four years. The defendants had full liberty to present their side of the case. Judgment was given September 11, 1793, the trial having taken place just as Marie Antoinette was being tried before a very different tribunal. Champertois, the presiding judge, was one of those magistrates elected by the people of Paris under the new order of things. He

notes in his judgment that Latude had been guilty of an attempt at swindling himself into the good graces of "the all-powerful woman"; but this had not merited so long and cruel an imprisonment. The Pompadour heir is accordingly sentenced to pay Latude 40,000 francs. As to the King's minister, Amelot, the damages are assessed at 20,000 livres, for a reason which will be eagerly caught up by the opponents of Taine. After Latude had been in the Bastille twenty-nine years, the lieutenant of police noted the fact on the prisoner's petition, and added the words, "His lot depends on the minister." Amelot wrote underneath, "Nothing to be done"—words which kept Latude in prison five years longer. Whatever the misdeeds of the Revolution, it made such arbitrary exercise of power impossible for the future. S. D.

Correspondence.

MOVEMENT TO MAKE BROWN UNIVERSITY NON-SECTARIAN.

To the Editor of The Nation:

Sir: A movement has been started among the alumni to make Brown University in every respect non-sectarian. The charter of the university, granted by the General Assembly of the Colony of Rhode Island in 1764, provided that the corporation shall consist of two branches, the Trustees and the Fellows. The Trustees shall be thirty-six in number, of whom twenty-two shall forever be Baptists, or Antipædobaptists; five, Friends, or Quakers; four, Congregationalists; and five Episcopalians. The Fellowship shall constitute a learned faculty to confer degrees, while the instruction and immediate government of the college shall rest in the President and Fellows or Fellowship. The number of the Fellows, inclusive of the President, shall be twelve, of whom eight shall be Baptists, and the rest indifferently of any or all denominations. The President shall be a Baptist. Whatever may be a man's character, achievements, genius, scholarship or peculiar capacity in educational matters, he cannot, unless he is formally connected with one of the four specified denominations, be elected a trustee. He can never be a trustee if he happens to be a Methodist, a Presbyterian, a Lutheran, a Swedenborgian, a Roman Catholic, or not a member of any church. No man can be elected President if he happened to be christened in infancy, unless he was immersed later, upon reaching maturity. The same restriction applies to eight of the twelve Fellows. The wisdom of the view that the rite of baptism should be entered into only when one has reached sufficient maturity to be able to decide for one's-self as to its meaning, and to assume the obligation it stands for, is conceded by many who are not formally Antipædobaptists, but the wisdom of the continuance forever of these restrictions of a past age upon the development of a college may well be questioned.

To understand another important restriction in this charter, while at the same time to do justice to the liberal spirit in which the administration of the college is conducted, the following clause of the charter must be cited in full:

It is hereby Enacted and Declared, That into this liberal and catholic Institution shall never be admitted any religious Tests: But on the contrary all the Members hereof shall forever enjoy full, free, absolute and uninterrupted Liberty of Conscience: And that the Places of Professors, Tutors, and all other Officers, the President alone excepted, shall be free and open for all Denominations of Protestants: And that Youth of all religious Denominations shall and may be freely admitted to the equal Advantages, Emoluments, and Honors of the College or University; and shall receive a like fair, generous and equal Treatment during their Residence therein, they conducting themselves peaceably, and conforming to the Laws and Statutes thereof. And that the public Teaching shall in general, respect the Sciences; and that the Sectarian Differences of Opinions shall not make any Part of the public and classical Instruction: Although all religious Controversies may be studied freely, examined and explained by the President, Professors, and Tutors, in a personal, separate and distinct Manner to the Youth of any or each Denomination; And above all, a constant regard be paid to, and effectual Care taken of, the Morals of the College.

This is admirable except the clause limiting "the Places of Professors, Tutors, and all other Officers, the President alone excepted," to members of Protestant denominations. Whoever wrote this must have had but a poor sense of humor thus to impose a test in the very section in which he says no test shall ever be admitted.

The alumni who would abolish the religious tests would simply make Brown University, in fact as in name, what it professes to be, a non-sectarian college with complete separation of education from ecclesiasticism. If they would be true to their great distinctive principle of soul liberty, to no body of men should the change be so welcome as to those of the Baptist denomination. Brown is not a Baptist college in any true sense of the term. The distinctive theological principles of the Baptists are not taught there, it does not fit young men for the Baptist ministry, and while it is true that in the past Baptists have contributed largely to its funds, an examination of the source of its endowments shows that a majority of its benefactors have not been Baptists, nor has the major part of its endowments come from them.

The change can only be made with the consent of the corporation. The decision in the celebrated case of Dartmouth College by the Supreme Court of the United States in 1819 (Trustees of Dartmouth College vs. Woodward. 4 Wheat. 518) protects the college from any change, unless the corporation consent. In that case it was decided that a charter is a contract; and article 1, sec. 10, of the Constitution of the United States prohibits any State from passing any law impairing the obligations of contracts. It was in consequence of this decision that when the charter of Brown University was amended by Public Laws, Chapter 451, February 11, 1863, the act began: "The Corporation of Brown University in Providence consenting thereto," and the corporation on the same day did consent thereto by a formal vote.

In consequence of a feeling among many of the alumni that the time has come for a consideration of this subject, the notices sent out last spring of the annual meeting in June of the Associated Alumni announced that the topic would come up for consideration. Accordingly, at that meeting a resolution was offered to appoint a special sub-committee to take into consideration the advisability of asking the corporation to petition the General Assembly to amend the charter by striking out all denominational requirements; to confer with the corporation on this subject; to report to the annual meeting of the Advisory Committee, and, with its approval, to print a report and to provide for a poll of the whole body of the alumni, if practicable, before the next annual meeting of the Associated Alumni.

But this mild proposal was opposed upon the ground that a proposal to strike out the denominational requirements of the charter should come from the Baptists themselves. It was pointed out, in reply, that the question of striking out the denominational requirements was not before the meeting, the question being the propriety of appointing a committee to examine and to report upon that subject. It was also pointed out that even if all these religious tests were stricken out, nothing would be taken away from the Baptists. They might even become gainers thereby, for they could elect, if they presented the strongest and best qualified candidates, more than the twenty-two trustees and the eight fellows to which they are now restricted.

It was asked whether the object of the suggested change was to enable the college to receive the benefit of the Carnegie fund. It was answered that the change was suggested because it is right it should be made, irrespective of the Carnegie fund. Some may approve the change because that will be the result, and some may disapprove because it will have that result. So some men may decline to send their sons to Brown if the change is made, while others may decline to do so unless it is made; but such considerations should not enter into an examination of the subject. If made, the change should be made because it is right.

But it was getting late in the afternoon and near the hour for the Phi Beta Kappa oration, which many wanted to hear. All conceded the wisdom of deliberate action after due consideration, so it was voted to lay the matter on the table until the next annual meeting. Notice was at once given that the subject would then be called from the table for consideration.

A few days later President Faunce referred to the subject in his annual report to the corporation. He said, in part:

If any change is to be made, it should be brought about, not by casting discredit on our fundamental instrument, but with full recognition of its extraordinary liberality. Many times it has been justly said that no other document of the eighteenth century so truly breathes the spirit of the twentieth century. If we change its letter, it must be in order to preserve its spirit, the immortal spirit of intellectual and religious liberty. No one, of course, would advocate such a charter to-day, if a new college were to be founded. Conditions have vastly changed, and some provisions are rapidly becoming antiquated and difficult to carry out. But we should not forget, and not allow the public to forget, that in 1764 our charter provided that the public teaching shall, in general, "respect the sciences" and "all the members hereof shall forever enjoy full, free, absolute, and uninterrupted liberty of conscience." The essential features of such a document, however we modify its transient provisions, are as precious to us as the outlines of University Hall. We must also acknowledge that in interpreting the

denominational requirements for trustees, the corporation in their elections, and the alumni in their nominations, have shown a most catholic temper. This catholicity has indeed sometimes been made a cause of reproach as if we were disingenuous in electing some men who are not in the strictest sense members of their respective churches.

The corporation took no action on the subject. It meets again in September, when perhaps the admirable presentation thus made by the president and the widespread agitation of the subject may lead to the appointment of a committee to consider and to report upon it. Otherwise many will feel that the considerate course of the Associated Alumni in postponing the subject until next year, thus giving the Baptists the desired opportunity to lead the movement themselves, has not been duly appreciated and acted upon.

AMASA M. EATON.

Providence, R. I., August 10.

KARL LAMPRECHT'S GERMANY IN THE EIGHTEENTH CENTURY.

TO THE EDITOR OF THE NATION:

SIR: With astounding fertility of mind and energy of purpose, Karl Lamprecht has added during the last decades volume after volume to his monumental "Deutsche Geschichte." Each new volume has aroused the same eager discussion, has met with the same violent opposition on the one hand and the same enthusiastic praise on the other.

One set of readers would find in each succeeding volume a new proof of the author's remarkable grasp of thought, of his wide sweep of vision, of his mastery in tracing the rise and fall of large intellectual or social movements. Another class would deride it as a fresh token of his hastiness in reaching conclusions, of his fatal gift for generalization, of his inability to see facts as they are, of his fundamental lack of true historical perspective. Both classes of critics would generally overlook the fact that this historian is a man of a very complex nature; that the defects and the merits of his method are inextricably interwoven with each other; that what he attempts is altogether out of the range of the ordinary conception of historical writing; that in trying to follow out the whole variety of the manifold radiations of national will, thought, imagination, and activity, he can hardly escape the danger of going astray in detail, and yet, by his very conception of national life as a mighty whole, is bound to open up vistas quite out of reach for the average digger for facts.

No part of Lamprecht's lifework is likely to arouse a more heated discussion of the sort just described than the recently published volume (the eighth of the whole series) dealing with the evolution of social and individual life in the Germany of the eighteenth century. I have thought, therefore, that a brief and impartial consideration of some of the most striking features of this volume, laid before your readers, may serve to lead to a somewhat calmer and more sober appreciation of the significance of the whole undertaking.

That Lamprecht's survey of Germany in the eighteenth century is a philosophical construction rather than a plain historical narrative, is clear at first sight. It is based on the fundamental conception that the eighteenth century marks the transition from what the author calls the individualistic to what he terms the subjectivistic period of modern German history. Every constructive writer has the right to coin his own terminology. So we have to accept Lamprecht's definition of individualism and subjectivism as designating two essentially different, if not mutually exclusive, states of mind and society: individualism, a state in which the individual is isolated, cut loose from the world of common feelings, emotions, and aspirations, a thing of the intellect, in matters religious and philosophical inclining to rationalistic and mechanical views, in politics submitting to the levelling influence of autocratic rule; subjectivism a state in which the individual has come to recognize itself as an organic part of a larger social and spiritual whole, and consequently seeks its own perfection and freedom in the full development of all those powers within it which make for a stronger and more active common consciousness and which heighten and deepen the sense of the interdependence of all life. We have to accept this terminology, I say; although it seems to me that the contrast of individualism and collectivism—terms which, if I am not mistaken, I have been the first to apply to the literary development of Germany in the eighteenth century—would express more satisfactorily what Lamprecht has in mind. The remarkable thing is that, without in the main doing violence to facts, Lamprecht succeeds in fitting the whole of the economic, and social, as well as the moral, intellectual, literary and artistic, evolution of eighteenth-century Germany into this scheme.

Only a few of the most noteworthy applications of this method can here be indicated. In the economic development, it leads Lamprecht to observe in the first half of the eighteenth century on the one hand the beginnings of a new *bourgeoisie*, resting, to some extent at least, on the modern principle of free competition; on the other, the first comprehensive measures of state supervision of industrial enterprises. In moral and intellectual matters, it enables him to trace the gradual heightening and intensifying of the inner life in this *bourgeois* society, and to show how the outburst of sentimentality in the fifties and sixties and the Storm and Stress of the seventies were simply the climax of deep-seated and slowly rising popular movements. And it enables him to bring before us in detail and with an astounding wealth of illustration the steady growth and victorious pressing on of the new ideals of life and the new gospels of art which finally in the life work of Goethe, Schiller, Kant, Mozart, and Beethoven find their consummate expression.

Lamprecht is anything but a perspicuous or persuasive writer. He is often verbose and usually professorial; at times his style is cumbersome to a degree. Rarely does he betray the power of creating plastic characters. For the most part, his narrative moves on unillumined by flashes of genius, tramping along (so to speak) on the monotonous road of general categories. Only now and then, notably so in the description of the friendship between Goethe and Schiller, and in the character sketches of Kant and Beethoven, does the warmth of his feeling lend a decided personal impressiveness and ruggedness to his words. His strength lies, not in the clearness of his thought or the neatness of his observation, but in what may be called a primitive instinct for the intellectual and moral forces that shape the lives of men. His book is, indeed, a history of these forces rather than of the men and the works inspired by them. In the history of conceptions of life, in the survey of moral impulses and æsthetic ideals, especially in so far as they have affected masses of men, his account of eighteenth-century Germany is an achievement unsurpassed if not unparalleled.

In what other book is there to be found an account comparable to that given by Lamprecht in the chapter entitled "Neue Weltanschauung," of what may be called the intellectual fluid surrounding the classic art and poetry of the Weimar period? How the rationalistic view of the soul as a blank surface receiving impressions only from without gradually changes to the conception of it as an unfathomable ocean containing within itself hidden treasures and countless wonders; how the monopoly of the intellect is constantly inveighed upon and finally overthrown by feeling and intuition; how the nature and the domain of genius come to be an absorbing topic of philosophical speculation; how the bars which rationalism had erected between man and the rest of creation are torn down, one after another; how the universe more and more reveals itself as an infinite living organism; how man's part in this organism more and more comes to be understood as that of a free spiritual agency, mysteriously connected with the sources of all life and drawing from its own innermost self the absolute assurance of an ideal world underlying all reality—these are only some of the topics which make this chapter a comprehensive analysis of the spirit which found its artistic embodiment in "Faust," "Wallenstein," and the Ninth Symphony.

Truly, in looking back upon such a chapter as this, one is not surprised to hear Lamprecht utter words of derision and scorn at the shallow methods of the literary historian who sees his main task in tracing the formal influence of one writer upon another. Inasmuch as these methods have frequently, although erroneously, been designated as typical of modern German scholarship, I cannot forego closing this brief notice of Lamprecht's book by quoting a passage of his on historical principles so diametrically opposed to his own:

> It shows the shortsightedness of the traditional manner of historical writing that the whole abundant spiritual development described in these pages is often traced back to certain isolated literary events from the fifties to the seventies of the eighteenth century. The epoch of sentimentality is said to have been called forth by Klopstock's "Messias," the age of Storm and Stress by Goethe's "Götz von Berlichingen," and so forth. What a naïve turning about of cause and effect! What a poverty of historical intuition! Some investigators have even gone further. They think they have explained everything, when they are able to point to some "foreign" literary influence. Thus a great national movement, the transition of the German people from

individualism to subjectivism, is explained by putting it to the account of Shakespeare and Rousseau, or even of "Ossian" and "Yorick's Sentimental Journey." Such views as these are best criticised by the Biblical word: By their fruits shall ye know them.

Fortunately, we may add, such views are not held by anybody worth considering.

KUNO FRANCKE.

Gilbertsville, N. Y., July 27.

DEFOE AND WOODWARD.

TO THE EDITOR OF THE NATION:

SIR: In the second of his interesting "Bibliographical Notes on Defoe," Prof. W. P. Trent, apparently speaking of Lee's "Chronological Catalogue," says:

> Of this large list some are plain errors, *e. g.*, the queried ascription to Defoe of Gay's poem "Wine," and the categorical ascription of Josiah Woodward's "Account of the Societies for the Reformation of Manners" (*Nation*, July 11, p. 30).

In the British Museum catalogue and elsewhere this last pamphlet, of which two editions were published in 1699, is attributed to the Rev. Josiah Woodward; and Professor Trent has accepted this attribution. Yet it can, I think, be conclusively shown that Woodward did not write the pamphlet. After enumerating the duties of about a dozen of the societies organized late in the seventeenth century for the suppression of immoralities and the prosecution of offenders, the author of the pamphlet goes on to say:

> These are the SOCIETIES which our late *Gracious Queen*, as the Learned *Bishop* that hath writ her LIFE tells us,* took so great *Satisfaction* in, that She inquired *often* and *much* about them, and was *glad* they went on and prevailed; which, thanks be to God, they *continue* to do; as the Rev. Mr. *Woodward*, who hath obliged the World with a very particular Account of the *Rise* and *Progress* of them, hath lately acquainted us. ("An Account of the Societies for Reformation of Manners, in London and Westminster, and other Parts of the Kingdom," London, 1699, pp. 15, 16.)

It is obvious from this passage that Woodward could not have been the author of the pamphlet from which it is quoted. Yet Woodward did write a pamphlet on the Societies. In the Epistle Prefatory to a sermon preached before the Societies on December 28, 1696, Woodward thus alluded to his own pamphlet: "*As it is more particularly related in an* Account of the Rise and Progress of the Religious Societies of Young Men, *lately published*" (p. viii). The title of Woodward's pamphlet is, "An Account of the Rise and Progress of the Religious Societies in the City of London, etc. And of the Endeavours for Reformation of Manners Which have been made therein." No copy of the first edition is known to me, but according to Arber's "Term Catalogues" (ii., 600) it was published in November, 1696, under the title of "An Earnest Admonition to All; but especially to Young Persons to turn to God by speedy repentance and reformation. Being the substance of six Sermons. . . . To which is added, An Account of the Rise and Progress of the Religious Societies of Young Men, and of the Societies for Reformation." In the British Museum are the second (1698), the third (1701), and the fourth (1712) editions.

If, then, Woodward did not write the 1699 pamphlet, who did write it? May it not have been written by Defoe? On this point, of course, the present writer has no opinion to offer. Let me add that copies of the 1699 pamphlet are in the Boston Athenæum and the Harvard College Library.

ALBERT MATTHEWS.

Jefferson, N. H., July 29.

*The allusion is to Gilbert Burnet's "Essay on the Memory of the late Queen," published in 1695.

TO THE EDITOR OF THE NATION:

SIR: I have already thanked Mr. Matthews for his kindness in communicating to me the facts contained in the letter printed above and for giving me an opportunity to examine his article "A Dorchester Religious Society of Young Men," printed in the *New England Historical and Genealogical Register* for January, 1906. Mr. Matthews's quotation from "An Account of the Societies for Reformation of Manners in London and Westminster, etc." (1699) seems to me to furnish very strong grounds for rejecting the ascription of the book to Josiah Woodward; for, although I can furnish an instance of a clergyman's speaking of himself in the third person in such a way as to make one argue that he could not possibly be the author of the tract under investigation, there were obvious reasons for that Scotch divine's trying to throw his readers off the scent, and such reasons seem wanting in the present case.

Assuming then that Woodward did not write the 1699 "Account," Mr. Matthews may well ask whether Defoe did not. The book is definitely attributed to him in the British Museum Catalogue under "Defoe," although what is apparently a second edition of 1699 is under "London" attributed to Woodward. What may possibly be a third edition of 1699 is attributed to Woodward in the "Supplement," but a comparison of the copies would be needed to determine whether it is really the same book. I examined the edition of 1699, attributed to Defoe entirely from the point of view of endeavoring to determine whether the Museum Catalogue was correct in including it among Defoe's works or Lee correct in omitting it. My notes show that I was left in a state of suspended judgment. Later, on finding in the Columbia copy and elsewhere the positive ascription to Woodward, I concluded that the ascription in the Museum Catalogue under Defoe must be an error, and so wrote in the paragraph which occasioned Mr. Matthews's letter. I am fresh from a partial examination of the fifth edition of the book (1701), and regret to say that I have found no valid reason for assigning it to Defoe. I use the word "regret" advisedly, for with such a voluminous writer one feels cheated when there is a single year of his life to which one cannot positively ascribe an item. One thousand six hundred and ninety-nine seems to be such a year in Defoe's career. Of the six possible ascriptions for that year that I have gathered thus far, I cannot be sure of any, and I am strongly inclined toward none. I shall reëxamine the "Account" in the hope of discovering some clue that will warrant at least its tentative ascription to Defoe, for the considerable use it makes of Greek and one or two other features, to say nothing of its exemplary subject, make it a tract which would figure well on the virtuous side of Daniel's ledger.

W. P. TRENT.

New York, August 9.

THE BRITISH MUSEUM READING-ROOM.

TO THE EDITOR OF THE NATION:

SIR: Your readers doubtless remember the announcement made last spring in the *Nation*, through a correspondent in London, concerning the closing for some months of the large reading-room of the British Museum. Permit me to give briefly my own experience in connection with this. Applying from Canada for the privilege of a special ticket, I received a favorable reply *by return of post*. On arriving in London, I had the additional gratification of finding that the whole catalogue, the bibliographical reference-volumes, and the complete consulting library on the ground floor had been shifted to the temporary quarters, and were as readily accessible as before. During my period of work, I have on no occasion waited more than twenty-five minutes for any work requested. What is perhaps more noteworthy still, is that this vast work in administration seems to be taken by the whole personnel of the Library as a natural part of official duty; and I am not aware that the London press has given this achievement any particular measure of consideration.

PAUL T. LAFLEUR.

Paris, July 29.

THE CATENA AUREA.

TO THE EDITOR OF THE NATION:

SIR: About the year 1885, Bocca, a well-known dealer in rare and second-hand books of Rome, sold in America a very old Codex, "Expositio in Quatuor Evangelia" (or as it is modernly called the "Catena Aurea") of St. Thomas Aquinas. At the end of the text the MS. bears, if I am not mistaken, the following date: "anno M° CC° LXX° VI°" (1276). If that is not the precise date, it is wrong by only a few years, either before or after.

My purpose in writing to you is to find out its present whereabouts. Should you be unable to furnish the information, perhaps some reader of the *Nation* can.

F. G. HORN, O. P.

New York, August 8.

Notes.

The Makers of Canada Series (Morang & Co.) is soon to include a "Life of Sir John Macdonald," by Dr. George R. Parkin, C. M. G.

Doubleday, Page & Co. announce for publication this month "The Lone Star," by Eugene P. Lyle, jr.; "The Road to Happiness," by Mrs. Van Koert Schuyler; "To Him That Hath," a story of the New York Bowery by Leroy Scott; "The Memoirs of Madame Ristori," and "Daffodils, Narcissus, and How to Grow Them," by A. M. Kirby.

E. P. Dutton & Co. publish this week "Corolla Sancti Eadmundi," edited by Lord Francis Hervey; "Villani's Chronicle," translated by Rose E. Selfe and edited by Philip H. Wicksteed; "The Art of Reconnaissance," by Col. David Henderson, D. S. O.; and "Soldiers of Fortune in Camp and Court," by Alexander Innes Shand.

Duffield & Co. announce the following for publication this autumn: "Painters and

Sculptors," a new and copiously illustrated volume of art criticisms by Kenyon Cox; "Houses for Town or Country," by William Herbert, with over two hundred pictures; "Historic Churches of America," by Mrs. N. U. Wallington, with an introduction by the Rev. Dr. Edward Everett Hale, and many illustrations; "Plays of our Forefathers," by Prof. Charles M. Gayley of the University of California; "Poems of Edgar Allan Poe," edited by Edmund Clarence Stedman and George E. Woodberry; "House Health," by Dr. Norman Bridge; "The Holy Grail," a posthumous drama by Richard Hovey; "Gypsy Verses," by Helen Hay Whitney; "Familiar Faces," a new book of comic verse by Harry Graham; and a new and specially illustrated Vermont edition of Miss Theodora Peck's "Hester of the Grants."

We note the appearance of six more volumes in the World's Classics (Henry Frowde): Leigh Hunt's "The Town," edited by Austin Dobson; Richard Cobbold's "History of Margaret Catchpole," edited by Clement Shorter; George Herbert's "Poems," edited by Arthur Waugh; R. H. Horne's "New Spirit of the Age," edited by Walter Jerrold; Dickens's "Great Expectations," with six illustrations by Warwick Goble, and Frere's "Four Plays of Aristophanes," with an introduction by W. W. Merry.

Buxton Forman has given to the Keats-Shelley Memorial Corporation a mass of books, pamphlets, newspaper cuttings, etc., illustrative of the poets' works. They will be placed in the museum in Rome.

Arrangements have been adopted for printing an elaborate descriptive catalogue of the famous library of Samuel Pepys, which since 1723 has been in the keeping of Magdalene College, Cambridge. The library has been left during all these years in exactly the same state in which its collector arranged it on the shelves of the oak presses whose construction is recorded in the Diary, and this is the first attempt to put it generally at the service of bibliophiles. The collection numbers only about 3,000 volumes, but as many as half a dozen distinguished specialists have been engaged to catalogue them.

The report of J. C. Schwab, librarian of Yale University, for the year ending June 30, 1907, notes the progress made in unifying the work of the different departmental libraries. In the case of all, the main library is now supplied with a catalogue of the serials and similar publications taken, and in several of them the university librarian has been officially designated as purchasing agent. The aim "is not so much to collect all the books of the university under the roof of the university library as to unify the administration of all the libraries concerned, and make the central library the clearing house for all of them, where the catalogue of their contents may be found." The policy of making access to the shelves more general, he reports, has been followed with gratifying results, and without any increase in the number of books lost. In view of "the increasing part of the time of the library staff given to directing students and officers to the material they need," Mr. Schwab urges that the proportion of the university's revenue given to the library under the old order of things is no longer just or adequate.

Plans for the new building for the library of the University of California have been completed and adopted by the regents, and work on the structure is to begin at once. It promises to be one of the noblest and largest of its kind in this country, covering a space two hundred feet square, and providing room for 500,000 volumes, in addition to numerous reading and seminar rooms. A classic design is to be followed, its chief feature being a colonnade of Corinthian columns, with an imposing doorway. Its material is to be white granite, and no woodwork is to appear anywhere in the building. Special quarters are to be provided for the great Bancroft historical library, which came into possession of the university about two years ago.

Prof. Kuno Francke wishes us to correct a misunderstanding which might arise from our note in the *Nation* of June 27, on his "Germans Ideals of To-day." Most of the brief papers making up the chapter "Sketches of Contemporary German Literature" first appeared in the *Nation*. The longer essays were originally published in the *Atlantic*, the *International Quarterly*, and the *Outlook*. The essay on "The Future of German Literature" has not been printed before.

For about fifty years, which cover, roughly speaking, the last quarter of the eighteenth century and the first quarter of the nineteenth, Edinburgh, rather than London, was the real centre of the intellectual life of the United Kingdom. The dominant figure, both in literary and legal society, was, for the greater part of that period, Walter Scott. In his "Edinburgh under Sir Walter Scott" (E. P. Dutton & Co.), W. T. Fyfe furnishes a useful supplement to Lockhart and the "Letters" and "Journals." He describes in detail the topography of the Old City, the gradual improvements, the exodus to the New Town, and the society and manners of the older generation, contrasted with Scott's contemporaries. Several chapters are devoted to the great Scottish judges of the eighteenth century, their wit, eccentricities, and too frequent brutality, men such as Stevenson drew in "Weir of Hermiston." The main incidents of Scott's career guide Mr. Fyfe to descriptions, well written and always interesting, of the men and manners of "mine own romantic town," the Ballantynes, with their fatal fascination for Scott, Constable, and Jeffrey, and many figures less familiar to the ordinary reader, though all worth the closer acquaintance that one gains through these pages. This is a book that will lead many admirers of Scott into fresh paths, especially, perhaps, to the reading of Lord Cockburn's "Memorials," an admirable study of the social life of the Scotland of the period, from which Mr. Fyfe quotes many entertaining passages.

That was a happy idea of Peter Rosegger's publisher to propose to the great German story-teller a selection of his narratives having to do only with the wonderful Abelsbergers ("Die Abelsberger Chronik." New York: G. E. Stechert & Co.), and an equally felicitous response on the part of Rosegger, who answered: "Do I agree to the proposition? Yes, indeed, if the man believes that such a little book may bring about some laughter among our contemporaries. For what is more necessary in the twentieth century than hearty laughter? For this reason, I have been going about a long time with the thought of founding a high school in Abelsberg, where one may learn laughing." The genial fun-maker describes Abelsberg (which any child can find on the map!) as lying between the forty-sixth and fifty-fourth degrees of northern latitude, and the fourth and sixteenth degrees of eastern longitude, which seems perfectly natural, and suggests the idea that Germany has not only done much of the thinking for the rest of the world, but has supplied a good deal of its humor, too. What is of special interest in connection with Steiermark's dialect artist is that, realizing the precious possibilities in his experience as peasant and tailor, he has had the good sense to stick to the fields and his tailor's goose. It is thirty years and more since Rosegger, under the pen name of "Petri Kettenfeier," founded his famous national magazine; his works have expanded to thirty volumes or more, and the world is still laughing with the Waldschulmeister over the bass-fiddle war and the Abelsberg Katze. In 1902 a selection of Rosegger's stories most interesting to youth was published under the title of "Als ich noch den Waldbauernbub war," and the cordiality with which they were everywhere received promises well for this latest venture. For those most familiar with Rosegger and his village and mountain life, it may be noted that recently he was asked if Social-Democracy was threatening the regions of life hitherto regarded as remote from the humming mart, and that his answer is a serious affirmative, declaring that Socialism has long since pushed its way in among the valleys and the rocky clefts.

One can hardly fail to have at least a sentimental interest in a volume of sermons preached in the town of Giles Cory, Samuel Parris, and the Rev. Arthur Dimmesdale. The sermons "Concerning Life," by the Rev. George Dimmick Latimer, minister of the North Society of Salem (Boston: The American Unitarian Association), are not particularly aggressive, but one finds in them a healthful tone, a manly spirit, an utterance free from cant, and here and there a touch of more than usual cunning on some current foible, with a mild and gentle suggestion of remedy, as if the speaker were confident that to know a fault is to cure it, with his audience, and that violent persuasion is superfluous.

A large amount of diligent research is evident in the Bohlen Lectures for 1906 on "The Samaritans: The Earliest Jewish Sect, Their History, Theology, and Literature," by Prof. James Alan Montgomery, Ph.D., of the Philadelphia Divinity School (The John C. Winston Co.). As indicating the mass of material reviewed, it may be mentioned that the text of the Samaritan Liturgy in the British Museum fills 2,000 quarto pages, and this does not include many liturgical texts found only in Continental libraries. Despite his industry, Professor Montgomery does not claim to have solved the problem of the origin of the Samaritans. It is clear that they are a Jewish sect, differing from Judaism in location of worship upon Mount Gerizim, but as to how they achieved separateness we are still left in mystery.

The difficulties of the common view, which is based upon II. Kings xvii., and according to which the Samaritans were a mixed race of foreign colonists with a syncretistic faith, are recognized by Professor Montgomery. The criticism of other Old Testament passages and of references in the New Testament is not thoroughgoing. The volume brings into convenient form a large amount of information hitherto not readily accessible, and is furnished with a useful bibliography.

In his Preface to "Before Port Arthur: The Personal Diary of a Japanese Naval Officer" (E. P. Dutton & Co.) the translator, Capt. R. Grant, states that he has made his version from a Spanish translation of a Japanese original. Having no knowledge of the Japanese language and without having seen the Japanese original, he cannot state "how far the Spanish book is an accurate version of the original work." The chances, are, however, that the Spanish expert did his original no hurt; for the volume before us is evidently one of a growing class of books dealing with the Russo-Japanese war which are produced under Anglo-Saxon skies and are attributed to non-existent Russians and Japanese, who are supposed to have written them while they fought. There is nothing in the volume that presupposes a Japanese naval officer as the author. The rapid shifting of the hero from torpedo-boat to fire ship, from fire ship to gunboat, and on to cruiser and battleship, impresses us as having taken place not for the good of the Japanese naval service but for the exigencies of the historian's rôle.

Prof. Camillo von Klenze's "The Interpretation of Italy during the Last Two Centuries" (University of Chicago Press), is intended, according to the sub-title, as a contribution to the study of Goethe's "Italienische Reise." The writer compares the "Reise" with its predecessors in the same field in the eighteenth century and with its successors in the nineteenth, in order to determine to what extent Goethe depended on the former, and has been enlarged and improved upon by the latter. The upshot of the whole matter is that Italy contained nothing for Goethe except the remains of Hellenized Rome, just as she had had nothing else for his precursors. In other words, Goethe in his criticism of Italy was at his best in virtue of what he had learned from Winckelmann. At Verona he could see nothing but the amphitheatre; at Rome nothing but Greco-Roman sculpture, the Forum and the Colosseum. Padua, Perugia, and Florence he regarded as almost beneath his notice. He admired chiefly in Venice that which she had inherited from the "divine genius of Palladio." His condemnation of St. Mark's reminds one of his impudent and ignorant depreciation of Sir Isaac Newton's physics. Dr. von Klenze tries to save his hero's credit by holding him up to our admiration as "the first traveller who attempts to understand various phenomena in Italy as products of forces," and by enlarging on the scientific spirit displayed in his observations. But the fact remains that Goethe in his conscious reasonings was never anything more than an eighteenth-century rationalist; and, among other things, his low estimate of Dante might have been quoted to show his utter blindness to the greatness of mediæval Italy. Dr. von Klenze's style and treatment do not, we regret to say, rise above the level of the doctor's dissertation; while there is too much cataloguing of details, and too little original reasoning and writing, some important facts are left out. For example, Ruskin is mentioned only incidentally. No account is given of those great works like the "Stones of Venice," which have been so influential in forming modern opinion of Italy. The author's language, as well as treatment, contains too many reminders of Germany. He constantly uses "dome" to mean cathedral. And we would suggest that words like *Zeitgeist* and *Weltanschauung* have by this time an unpleasant suggestion of cant, besides having perfectly good English equivalents.

The death is announced of Edmond Demolins, whose book, "A quoi tient la supériorité des Anglo-Saxons," made almost an international sensation. M. Demolins was director of *La Science Sociale*, and a prolific writer.

THREE BOOKS ON IRELAND.

The Outlook in Ireland. The Case for Devolution and Conciliation. By the Right Hon. the Earl of Dunraven. New York: E. P. Dutton & Co.

L'Irlande Contemporaine et la Question Irlandaise. Par L. Paul-Dubois. Paris: Perrin & Cie.

A Considcration of the State of Ireland in the Nineteenth Century. By G. Locker Lampson. London: Archibald Constable & Co.

Set an Englishman and a Frenchman to writing a book about Ireland, and which one will display the more vivacity, which the more plodding industry? No; you are wrong. It is the Englishman who has the *esprit;* the collector of facts is the French writer. Then pit your Englishman against an Irishman: which will produce the dull volume, which the witty? Wrong again; it is the Irishman who is portentously heavy, the Englishman who has eloquence, irony, indignation, sprightly turns, and all the Celtic graces of style.

Lord Dunraven's book has an inevitable air of being born out of due time. It was aimed to hit the expected Irish Bill of the Liberal Ministry. That was to be a measure of devolution, and the Earl of Dunraven, as a leader of the devolutionists among the Conservatives, might well think the day of his vindication was drawing nigh. But even as he was taking sight at the Irish Councils Bill, the Nationalists repudiated it, and the Government withdrew it. Yet his Lordship had pulled the trigger, and his book had gone off. It is a sober argument, from the standpoint of an Irishman who is both a Protestant and a Unionist, for turning over to the Irish a certain control over their affairs. The author follows the usual "heads of discourse"—economic, agricultural, educational, political. It is a moderate and rational programme which Lord Dunraven sketches, but, unhappily, time has made it untimely.

M. Paul-Dubois has been for some years known as a serious student of history and finance. His book on American railways, in 1896, was favorably received, and gave a taste of his quality. Now in his "Contemporary Ireland" he has applied the same patient methods of accumulation of fact, collection of authorities, with summary statement of his results. In this volume we have an historical introduction covering eighty pages; then four chapters dealing with the political and social condition of Ireland; four chapters more on the land question and the financial situation; finally, chapters on education, the Gaelic movement, economic regeneration, and the religious question. All is thoroughly studied from good sources, and M. Paul-Dubois has had the advantage of travel in Ireland, and association with some of her political and educational leaders. He writes with much sympathy for the Nationalist movement, though he believes Irish independence impossible, and has no hope except for a more or less restricted form of self-government. In actual remedy, then, M. Paul-Dubois is not far away from Lord Dunraven.

It is, however, Mr. Lampson's "Consideration" which is the weightiest and at the same time the wittiest book of the three. This writer is a master of easy satire. He even turns it against himself in his preface. He hopes for a possible maximum of forty-two readers to "skim the pages." "Twenty-two of these may be Milesians, who will condemn them, because issuing from a Saxon who is not a Home Ruler. Fifteen of the other twenty will be bluff Britishers, who will vote them anti-English and lurch by on the other side." This leaves only five at the outside in whom the truth may find a lodgment!

It is a combination of history, character-drawing, political discussion, and the evisceration of blue books which Mr. Lampson's volume offers. He is able to give a good sweeping account of a movement; to set forth the excruciating details of Irish misgovernment in cold but terrible array. He is a shrewd observer of men. There are characterizations of Curran and O'Connell and Parnell, of Peel and Gladstone and Disraeli, which one feels to be incomplete, and possibly unfair, but of which one cannot fail to be impressed by the powerful strokes. Mr. Lampson writes with a qualified sympathy for Ireland, but with an almost unqualified contempt for her English rulers. There are pages on pages of attempts to pierce John Bull's hide with sarcasm. "Ireland, without a doubt, was a wicked and ungrateful country. After a careful study of the best opinion entertained by her rulers, the author has reluctantly arrived at this inevitable conclusion." There is a passage (p. 103) on George IV.'s visit to Ireland almost worthy of Swift, and one thoroughly Swiftian on the amazing goodness of the English in keeping themselves so sleek and well-fed in order to make the Irish feel more keenly the ingratitude of their own starvation! The author's main contention is that the difficulty of governing Ireland is purely mental: that the English have never understood the Irish, and for that reason might as well have written all their statutes for Ireland on the sands of the seashore. But what would he himself do, at the end of his powerful demonstration of incompatibility? Why, he would build a tunnel under the Irish Channel, so that the two peoples might intermingle more freely

and intermarry more often, and so solve the Irish problem! He has minor recommendations about university reform and land legislation, but his chief hope lies in what we have said. It is a strange, we will not say a pitiful, conclusion, for a man to arrive at who has led his interested readers along the same path trodden by Lord Dunraven and M. Paul-Dubois, but who shrinks when he sees where it is leading.

CURRENT FICTION.

Tinman. By Tom Gallon. Boston: Small, Maynard & Co.

Whenever a novel appears which does not deal too exclusively with the aristocracy, its admirers hasten to assure the public that Dickens has again come among us, improved and brought up to date! Many people professed to find this flavor in Mr. De Morgan's delightful "Joseph Vance"! The unbiassed criticism on the cover of "Tinman" claims that "in plot, style, and treatment, it compares favorably with Dickens"! It is well that this has been pointed out, since unaided no sane person would have discovered it. "The House on the Marsh" at a stretch—but Dickens!

Tom Gallon is gifted with the lurid manner. The clouds hanging over "The House of Usher" are as a dawn in June compared to the blackness permanently settled about Hammerstone Market. Even at twenty a young man might have experience enough to call in the police when his guardian went on so that "in all my life I never remember to have seen a man so suddenly become a wild beast as Jerry Fanshawe did then." Jerry ran about banging doors and blaspheming, "pulling at his lips with his long fingers. . . ." But he was not having things all his own way, since ". . . I had never seen on any face such a look of mingled fear and hopelessness and longing and misery as I saw in his face then." Although Jerry "clinched and unclinched his hands and moistened his lips and strove to speak," and also had that habit of examining his nails which is the primary impulse of every villain. Charlie had no suspicion of him (otherwise Jerry would have been immediately consigned to Bedlam or Reading Gaol, ending the story promptly at page forty-nine). As it is, notwithstanding an important manner, "Tinman" has only been strung out to store size by the ingenious device of repeating the heroine's adventures in the person of her daughter, merely giving a happier outcome to the fortunes of Barbara number two.

John Kendry's Idea. By Chester Bailey Fernald. New York: The Outing Publishing Co.

This is a lively novel of adventure without any of the sacrifices usually considered necessary in stories of this type. That is to say, although murderers, counterfeiters, detectives, villains, and cosmic Chinamen abound, and while events flash by so quickly as to keep a seasoned reader breathless, Mr. Fernald's own observations upon life at large are perfectly sensible, often amusing. Also his characters, if a trifle heavily emphasized at times, still talk and behave as real human beings might conceivably comport themselves under such startling circumstances.

The scene lies in San Francisco before the earthquake. John Kendry is a millionaire young man of aspiration, rather lost as to the means of realizing his idea which, at last analysis, is no more and no less than to be a useful citizen of the world, though rich. "He did not want more money, more power, more distinction than he possessed, yet he did not want to lose fellowship with men who were striving for those things." There is the American situation in a nutshell. He seeks equilibrium by attaching himself to an expatriated lady some years his senior, a lady whose brother hits her off as "A Europo-maniac, and that's the Americanest thing with hairpins. She turns round on her pivot and thinks she's an aristocrat. Well, you've only got to let her think she's made a morganatic marriage, and she'll have a sorrowing love for you all her life." Clearly, Mr. Fernald studies from the life and to some purpose, as when he describes a middle class American as being "Inferior to his clothes and superior to his manner of speech." His analogies are unfailingly apt, as when the strange sea-faring man complains " 'A sailor was like a seal,' he said, 'he couldn't live always in the water, and when he came ashore to make his nest, they had him skinned before he was cold.' "

It is rather noticeable that while the author nowhere affirms that his hero is a young man of ability, you are immediately convinced of John Kendry's being both clever and agreeable. In fact, the whole book is an encouraging example of the neglected truths that stories of adventure and action need not be childishly immature, that contact with Chinese mysteries does not of necessity make a hero of fiction show the judgment of a puppy under nine days old, that cheapness and illiteracy are by no means essential accompaniments to epics of contemporary adventure.

The Imperfect Gift. By Phyllis Bottome. New York: E. P. Dutton & Co.

The imperfect gift is the handsome person and undying affection of one Ben Armitage, actor manager. Although credited with something of a past, this gentleman behaves in a manner far more suggestive of good King Wenceslaus than of Don Juan. In spite of everything, Marjory falls in love with him. "Everything" is what she learns from Evelyn, the day this beautiful elder sister explains to her all about Men. Evelyn has a well-worn rôle, to be handsome, worldly, successful, and highly contemptuous of other people's finer feelings. The Austrian Prince who falls in love with her at a ball exhausts this young lady's entire stock of romance. She refuses morganatic marriage, and secures a great match in one of those British peers who drink too much and talk like bus drivers. Marjory meanwhile develops from an ugly duckling with queer ideas into a striking beauty. A few quarters in elocution, and she is ready for the stage. One short season, on tour in the provinces, lands her as leading lady in London. Whenever the breath of scandal touches Ben, she nobly and devotedly breaks their engagement, and dismisses him forever. He invariably obeys, but turns up, unestranged, about the time she has reflected that her mission may after all be to make perfect the imperfect gift. The story is smoothly and competently told, and while its basis lies in the realm of mediocre, respectable fiction, the observation of detail, if a shade shopworn, is always sufficiently correct and agreeably expressed to make the whole fairly readable—if no better novel be at hand.

A Short History of Comparative Literature from the Earliest Times to the Present Day. By Frédéric Loliée. Translated by M. Douglas Power. New York: G. P. Putnam's Sons. $1.75.

The English title of this work is something of a misnomer. M. Loliée has no pretension to trace the development of the comparative method as applied to the study of literature. His business is directly with literature itself—the written records of human thought and feeling. It is these which he attempts to recount, in accordance with the natural classifications of race and language, but in a manner to associate contemporary products as far as possible. In short, his ambition is nothing less than to write, however briefly, the history of human culture.

As a result of such a gigantic undertaking, confined within the narrow limits of 350 pages, his book is conspicuous for broad surveys and vague generalities. By its lack of close individual characterization and accurate detailed description it lies at the very antipodes of Sainte-Beuve's critical method. In this respect it appears, at first sight, rather amateurish, like the work of a young man whose views are wider than they are deep. At the same time M. Loliée is no novice. Though little known in America, he has written a volume on sophism and the sophists, "Le Paradoxe," and has collaborated in another work of something the same general character as this, "Écrivains et littératures." Vague and indefinite, then, as his descriptions are, mere summaries and *résumés* for the most part, yet many of them are not without a certain care for atmospheric effects which reveals at all events the practised writer, if not the exact and cautious critic. Particularly remarkable in this sort are the accounts of the end of paganism and the close of the dark ages. A brief extract from the latter source will declare the writer's style at its best, as well as his manner of handling his subject:

> It is then we see them, a priest-ridden people, some in the still retirement of religious houses, lost in meditation or in prayer, suffering, raving, perhaps, in the dim light of the painted windows, eloquent of the Divine Life and Passion, a people of friars and monks, harassed by endless scruples and tortured by their own idea of the love of God. They were in a constant state of exaltation by their custom of meditating on the ineffable, and their souls were beguiled by mystical pains and delights, or by the troubles and uncertainties of a vague incurable melancholy which they named *acedia*.

In these broad and summary outlines there is something of the hauntingness of a suggestive and impressionistic poetry. In such instances as this, where it happens to accord with the nature of the subject, it is rather effective, though perhaps not eminently trustworthy.

At the same time it seems impossible that any one man should have read all

these books, to say nothing of having made the circuit in his own person of all the ideas and emotions of which they are the expression. He were either too wise or too weary to write at all. It is not surprising that a good deal of the volume should be made up at second hand from the common stock of criticism. Brief as are the characterizations, they are seldom so happy as they should be. "In prose Guez de Balzac was one of the first to be witty and melodious, Corneille following Rotrou in drama, and Malherbe succeeding Régnier in lyric poetry introduced between them the great intellectual movement which was to attain maturity under Louis XIV." Of this sort of thing there is altogether too much in a *précis* where every epithet ought to count. No doubt it is undesirable that a work of this kind should consist of a string of epigrams. But it is equally undesirable that it should degenerate into a mere *catalogue raisonné* in which the commentary is only a *cheville* or device for filling out the measure of the sentence.

At worst, however, in spite of the rather patchwork character of the composition, and in spite, too, of a certain critical destitution, it is something to have all these matters gathered together in one place, where they blend into a single perspective. At this elevation, too, with the world and its history unrolled before his eyes, it would be astonishing if the observer were not occasionally favored with a prospect unattainable at a lower altitude. Of such glimpses and *aperçus* it would be possible to cite numerous examples. Between Tolstoi and Rousseau, for instance, he institutes a rather unexpected parallelism. Of Germany he pertinently observes: "It might have been said of her, before the passion for military greatness had swallowed up her idealistic ambitions, that she was the India of Europe: vast, vague, with as many and varied aspects as her god, the Proteus of pantheism." Of Calderón he indicates what is probably true, that his drama is greatly overestimated through the influence of the Schlegels and the German romanticists. Suggestive also is a remark concerning the bent of the Spanish mind to archæology and political economy, for the reason that these studies are "so prone to illusion," "in that respect bearing a certain relation to fiction"—a suggestion which may serve to account for the curious affiliation between political economy and the modern novel.

The translation is not so good as it might be. It contains a few Gallicisms, as is to be expected—particularly "and which," and an occasional double negative. Most serious, however, is the abuse of the historical present, which even in moderation has an outlandish effect in English. Nor is the grammar always impeccable, to say nothing of a general flattening and reduction of the author's style, perceptible in the brief extract first quoted.

English Metrists in the Eighteenth and Nineteenth Centuries. By T. S. Omond. New York: Henry Frowde, $2.40.

This is an interesting volume, of 242 pages, besides appendices and index, on a dull subject. The long series of books and articles printed in English about English metric during the last two centuries—what could be duller to most readers? Until a recent period, their authors had as a rule little notion of scientific method; their ideas of fundamental concepts were hazy, confused, and shifting. Many did little but blindly copy their predecessors, often without credit; others, perceiving clearly enough the worthlessness of previous disquisitions, built up new systems of their own, ignoring predecessors—to be themselves in turn ignored, often deservedly. From one point of view, it is a disheartening tale of confusion of thought, of the blind leading the blind, of slow and painful and partial emergence of light from darkness. At times the solemnity and "superfluity of cocksureness" with which fatuous nonsense is laid down as self-evident law become really amusing. How comes it, one asks, that on so important an element of poetic form, which ought to interest all people of culture, the English-speaking world has been so slow in learning to think clearly, or even to see straight. The structure of their verse presented to our fathers no more difficult problem than the structure of Greek verse presented to the Greeks. But the Greeks appear to have had as early as Pindar's time an established body of doctrine that could be taught to the young. Does our relative slowness in solving our problem measure accurately the inferiority of our race in the power of scientific comprehension of familiar and simple phenomena? It certainly indicates our relative lack of interest in clear thinking about the arts. A philosophic reader will see in this story of slow development, and of persisting misconception, a typical instance of the manner of human progress.

Meanwhile, Mr. Omond endeavors "not merely to enumerate and summarize treatises, but to trace the gradual development of sound views of verse-structure." Teachers of English—too many of whom seem now to have no interest in the subject—should add this book to their working libraries. Above all, no one should venture hereafter to put pen to paper on the subject without studying, first this volume, and then several, at least, of the treatises here summarized. From Joshua Steele's "Essay towards establishing the Melody and Measure of Speech" (1775), enlarged and reissued four years later under the title "Prosodia Rationalis," to Sidney Lanier's "Science of English Verse" (1880), five years over a century, real progress was made; and not a little has been added in the twenty-seven years since Lanier. Mr. Omond has at last made easy for students an adequate survey of what has been done.

Perhaps it is going too far to say that a candid reader can hardly fail to discern the truth in this historical sketch. Mr. Omond reports impartially, perversity bulks large; a reader may become confused unless he already knows something of the subject. Some recent statement, based on Lanier, but briefer, would perhaps be best for one to start with, as it will present a single system and from a single point of view. In his eagerness to present every system as sympathetically as possible, Mr. Omond seems almost to shift his point of view, and to keep his mind too open on some important points. For example, does he think our common blank verse is regularly in even or in triple time? Apparently, the former (see pp. 182 f.), which is wrong; but some passages leave one doubtful. Hence also he bestows especial approval on two or three authors who couldn't quite make up their minds on fundamental matters, and vainly tried to combine views that are irreconcilable. He has grasped the idea that rhythm, in English verse as in music and the dance and in classical verse, is wholly a matter of time and time-intervals. But occasionally he seems not to have grasped this firmly enough to realize that no doctrine can be sound that in any degree conflicts with that. Only by carrying that principle through—by observing how the mind and voice divide time in reading aloud the verse of good poets as the poets meant it to be read, and then stating in the simplest way what is the procedure of poet and of the reader's mind and voice—can a rational system, adequate and simple, be worked out. In his closing pages Mr. Omond is rather more uncertain than he should be as to whether a secure basis has yet been found. The difference between Greek prosody and English is probably best realized by those who know Greek prosody best; but a better understanding of Greek doctrine of verse rhythm would have made Mr. Omond's judgment surer on some of the problems of English rhythm. It would also have modified his form of expression in one or two passages of comparison between Greek and English.

But neither these strictures nor some omissions and slips and even misjudgments, which are inevitable in such a work, can change the fact that the work is carefully done, and is to be received with gratitude. American writers, from Poe's "Rationale of English Verse" (1848) down, receive their due share of attention and of appreciation; Lanier's importance in particular is fully recognized, and his defects are criticised fairly. Appendix A contains addenda to and corrigenda in the author's previous list of English quantitative verses—would-be quantitative, that is: Appendix B in like manner enlarges and corrects his previously published list of works in English dealing with English verse-structure. For the latter we wish he had given the entire revised list, though it is true the body of the volume includes all that is important. There is also a good index of names.

Madame: A Life of Henrietta, Daughter of Charles I. and Duchess of Orleans. By Julia Cartwright (Mrs. Henry Ady). New York: E. P. Dutton & Co. $3 net.

On the cover this book is described as "Memoirs of the Princess Henrietta"; on the title-page inside as "A Life of Henrietta." It would be difficult to find a right name for it. "Life and Times" would classify it more correctly than "Life," but it belongs to a hybrid *genre*, being neither historical novel, nor yet pure history. Mrs. Ady is as scrupulous in going to original sources as any dryasdust historian. Her aim, however, is entertainment—instructive, no doubt, but still entertainment. Accordingly, she regards herself as free to indulge in unrestrained idolatry of her subject. This contrast between a minute, painstaking research which commands all our re-

spect, and a (doubtless) sweet, but quite uncritical, abandonment of worship, is the keynote of her writing. In short, her work may be recommended to the seeker after diversion and to the historical student alike. Besides throwing into clear relief the political osteology of the period, she conveys much of its glamour and romance—the silken sheen and violin music of the grand monarch's court.

Her idolized heroine, the daughter of Charles I. of England, born in a besieged city during the Cromwellian wars, reared by her widowed mother in royal poverty at St. Germain and Paris, married at seventeen to Louis XIV.'s worthless brother, the Duke of Orleans, an unhappy wife, but, thanks to her influence over Louis, a potent sister-in-law, more potent still as the one person in the world whom her brother, Charles II., really loved and respected, Henrietta died after a useful, even brilliant career, at the unripe age of twenty-six. She was unquestionably a clever, forcible, plain, but coquettish woman. Not merely did she patronize Molière, Racine, La Fontaine, Bossuet, and others such; she *understood* them. And most likely it was this thin, hectic, brilliant girl, who, during her hot flirtation with King Louis, first taught the Grand Monarque to appreciate those men of light and leading. She also exercised a very considerable influence over international politics by furthering her brother's earnest attempts to establish an *entente cordiale* between England and France. She reminds us not a little in this dual rôle of a later English princess who not only encouraged art and literature at a foreign court, but strove in the teeth of a Bismarckian opposition to bring about closer relations between her adopted and native countries—the late Empress Frederick, when she was Crown Princess of Prussia.

It is a tribute to Mrs. Ady's honest learning to say that the clearest part of her book is that dealing with Henrietta's political activity. Here there is no call for special pleading, and therefore no confusing contradiction between the plentiful data offered by the author and the idolatrous opinions which she sometimes chooses to espouse. Henrietta's influence in this regard is open to no misinterpretation. She acted not merely as the trusted go-between of her brother, but as his guide in trying to bring Louis round to his wishes. Charles kept up with her an intimate correspondence, which fully proved this statement. And here Mrs. Ady gives us a rare treat. She prints for the first time in their original form more than ninety of Charles's letters to his sister. Singularly vigorous and characteristic letters they are. Mrs. Ady asserts that they are "of rare interest." They are indeed so interesting that they rather displace the centre of gravity of her book. Mrs. Ady gives comparatively few letters of her heroine's, and such is the superior force of the direct human document that many a reader, we imagine, will derive from these memoirs a more vivid impression of Charles than of Henrietta. Though not strictly germane to the supposed central theme of the book, we must quote one of Charles's letters, taken at random:

WHITHALL,
8 Sept., 1662.

I am soe ashamed for the *faute* I have committed against you that I have nothing to say for myselfe, but ingenuously confesse it, which I hope in some degree will obtaine my pardon, assureing you for the time to come that I will repair any past failings, and I hope you do not impute it in the least degree to wante of kindness, for I assure you there is nothing I love so well as my dearest Minette, and if ever I fail you in the least, say I am unworthy of having such a sister as you! The Queene has tould you, I hope, that she is not displeased with her being heere. I am sure I have done all that lies in my power to lett her see the duty and kindnesse I have for her. The truth is, never any children had so good a mother as we have, and you and I shall never have any disputes, but onely who loves her best, and in that I will never yield to you. She has shewed me your letters concerning your quarrell with the K., and you were much in the right. He has too much ingenuity not to doe what he did. If I had been in his place I should have done the same. The Chevalier de Gramont begins his journey to-morrow, or next day; by him I will write more at large to you. I am doing all I can to gett him a rich wife heere. You may thinke this is a jest, but he is in good earnest, and I believe he will tell you that he is not displeased with his usage heere and with the way of living; and so farewell, my dearest Minette, for this time. I am intierly yours,

C—R.

No reader is likely to form from Mrs. Ady's book a less favorable opinion of the merry monarch than he had before; at all events, he will get a very definite opinion. So much can hardly be said about Henrietta.

Mrs. Ady's mania for idealizing, while attractive no doubt to many lovers of the beautiful, has the fault of obscurantism. She shuts her eyes to the obvious more than once. Take, for instance, her accounts of Henrietta's personal appearance. Mrs. Ady is most reluctant to admit any blemish in her angel. But even though there were not plenty of portraits extant to declare the fact, it might easily be read between the lines of flowery court tributes that Henrietta's was in reality a somewhat unfavored physique, and that she had to redeem outward defects by charms of wit, character, and—may we add?—of coquetry. Mrs. Ady strives hard to evade any such admission. In her earlier chapters she withholds the least hint of it, and, later on, when she conscientiously quotes some evidence to that effect, she manages so to distribute light and shade that the reader may well be puzzled as to the net result.

The instance is typical. Whenever there is any possible doubt about the princess's perfection, Mrs. Ady turns special pleader. She quotes the Bishop of Valence as saying: "With all her divine qualities, this princess was the most human of creatures." But she does not accept the logical consequences of the remark. Allusion has been made to Henrietta's coquetry. Whether it was excessive or not, Madame certainly excited devotions from the other sex which call for a more searching explanation than Mrs. Ady offers. Her notorious affair with the Comte de Guiche was after all but one in a series. "Die Menge thut es," said Heine. The repeated occurrence of passionate victims of Henrietta's fascination leaves us skeptical of Mrs. Ady's account of a remote, platonic Psyche in a niche. We yearn for a last instead of a first analysis. And Mrs. Ady seems inconsistent with herself; she has to admit that Manicamp, the cynical author of "Amours du Palais Royal," knew Madame well and had "every opportunity of studying her." She also admits that Madame de La Fayette, the close friend of the princess, author of the "Histoire de Madame Henriette," smooths over some matters. Madame de La Fayette derived much of her information from Henrietta's own lips, but, remarks Mrs. Ady, "more careful of Henrietta's reputation than this princess herself, she often found it difficult to reconcile truth with propriety." It is scarcely doubtful that Manicamp was a liar, but then, apparently, so was Madame de La Fayette, even if in lesser degree, and on the whole we may fairly conclude that here, as usual, the truth lies in the middle.

The Church and the Changing Order. By Shailer Mathews. New York: The Macmillan Company. $1.50 net.

The principal questions raised by Professor Mathews are, What shall be the attitude of the Church toward the new learning in philosophy, science, and biblical study? What stand shall be taken by the representatives of Christianity in relation to Socialism and modern social movements? What has the Church to say in view of the moral and social problems which are just now acute? That these are interesting and important matters, upon which light and wisdom are needed greatly, goes without saying. A sincere and earnest attempt, such as that of the author of this essay, to awaken appreciation of the seriousness of the situation should be accorded hearty welcome. It may be questioned, however, whether Professor Mathews has stated with sufficient emphasis the gravity of the problems which now press for solution, and whether his counsels to the friends of faith in the premises are anything more than an impossible compromise, in which neither side can rest satisfied. He would have the Church adopt the most cordial attitude toward the new learning, both scientific, historical, and critical, and yet he insists that "it has been its eschatological message which has given the gospel its grip upon human life"; he maintains that "any theology that is unaffected by a conviction of the reality of the risen Christ is not evangelical in the strictly New Testament sense," and the context makes clear his meaning that such a theology can not be evangelical at all. In other words, criticism must have freest scope, and must yet face the warning notice, "Thus far shalt thou come and no farther." We read that "no man under the influence of to-day's scientific thought can believe in any anti-legalism in God's relation to his world," and on the same page there is vigorous confession of a "risen Jesus, not, it is true, of ordinary flesh and blood, but of genuinely objective reality." It is declared that the gospel must be preached with primitive insistence upon the historic elements, and yet the necessity is maintained "of distinguishing sharply between the evangelic facts and the interpretation given them by people of the first century." It would appear that the demons, and the underworld for the dead, and angelic powers and principalities, belong to the temporary vocabulary which is done away, while the revivified personality who passed through closed doors and ate broiled fish and bread is essential doctrine which may not be relinquished except with the loss of Christianity itself.

Similarly as to social questions, Professor Mathews maintains that he is not a Socialist, and that "Socialism is essentially an economic system and approaches the individual life with much the same presupposition as did the older political economy it assails," and yet he declares also that neither the labor movement nor Socialism is "exclusively economic in motive," but both are expressive of "proletarian idealism." The Church can no longer preach "merely an individualistic salvation," and it is "a serious mistake to think that the present crisis will be settled by an unmodified individualism." It is difficult to see how the "real fraternity" which Professor Mathews describes as the future state of society differs from the Socialistic state whose anticipation gives verve and fire to the harangue of the street-corner agitator.

There are a sort of men who find skill to stand on both sides of a question, and who maintain the attitude with becoming grace. There are many who applaud them, and declare that they are progressive yet sane, open-minded yet truly conservative. A warning was once uttered, however, on the peril of putting new wine into old wineskins, and history affords abundant demonstration of the wisdom of the caution. Compromise has left behind a sad record of befuddled minds and consciences, and in the interests of clearness alone it were well, if we are to advance to a new order based on the bread-and-butter theory of the welfare of man, to take the step with our eyes open and under no misapprehensions based on old names for new doctrines.

The Whirlpool of Europe: Austria-Hungary and the Habsburgs. By Archibald R. Colquhoun and Ethel Colquhoun. New York: Dodd, Mead & Co. $3.50 net.

Too many books dealing with foreign and international politics nowadays depend for their solid substance of dates and figures on Baedeker, and their interpretation of contemporary movements on a facile power of generalizing from scanty journalistic observation. In contrast to such examples of the expanded or diluted magazine article, it is pleasant to lay hands on a serious study of an interesting problem by writers who can bring to the task the essential historical perspective and a capacity for making the event of the day relate to what came before it. The authors of the present volume have succeeded in presenting within some 340 pages—in itself no mean achievement in these days of the 600-page book of travels—an entirely adequate account, from the point of view of the general reader—of the origin of the Hapsburg power in Europe, its vicissitudes in the course of centuries, the upbuilding of the present dual monarchy on a multiform racial basis, and the elaborate machinery by which the component parts of a conglomerate political association are held sufficiently together for their own safety and kept sufficiently apart for their own convenience.

The greater part of the book is devoted to a study of the many nationalities that dwell under the sceptre of the Hapsburgs; and undeniably in that phase lies the chief interest which Austria-Hungary holds for the foreign observer. In the bitter conflicts between Czech and German in Austria or between Magyar and Croatian or Ruman in Hungary, there is involved not merely the fortunes of the races engaged, or of the great Power to which they belong, but the far broader issue of the future political constitution of Europe. Is it the fate of the smaller nationalities to be ultimately dominated by the more numerous races, to be incorporated, that is, into a great Pan-Germanic empire, a great Slavic empire, and a great Latin empire, or are they justified in fighting doggedly as they have been doing up to the present for the preservation of their languages, their traditions, and their local liberties, no matter how humble, in the hope that time which brings all things will also bring opportunity to them? The trend of present-day development would seem to be definitely the other way. Whether conquered and incorporated, or merely "protected" and advised, or annexed and "assimilated," the little state and the inconsiderable nationality have been disappearing before the great, unified Power. And not only that, but the instinct to oppress has manifested itself in races that are themselves the subject of oppression. The Poles who in German Posen are compelled to make sole use of the language of their conqueror in schools and law courts mete out the very same treatment to their Ruthenian peasants in Galicia. The Magyars who profess themselves the victims of Austria's ambition, are fairly unscrupulous in their conduct towards such subject races as the Rumans, whose kinsmen in independent Rumania show little mercy to the Greeks who, in turn, take their revenge out of the Macedonian Bulgarians. Swallow and be swallowed would seem to be the rule.

But, on the other hand, when we come to consider the very tenacity with which the petty peoples of Central and Eastern Europe have clung to their national existence, and, more than that, what numerous national renaissances, of varying importance, the past century witnessed, we shall be somewhat slow in predicting submergence for the small nationalities. The present volume, for instance, is lavish in its praise of what the Czechs have accomplished through self-help in regaining the upper hand over the Germans in their own historic land of Bohemia. So marked, indeed, has been their success that our authors have no hesitation in pronouncing the Bohemian Czechs the flower of all Slavic peoples, and in assigning to them the hegemony by right of that improbable Pan-Slavic confederation which in some quarters is dreamt of. Minute peoples like the Slovenes in Carinthia, Carniola, and Styria, or the Ladinos of the Tyrol, have revived their poor little dialects and literatures and founded schools and gymnasia and academies to preserve them. But far more important is the vast decentralizing movement which has arisen in the empire of the Czars. The various Russian revolutionary parties have not only had to take national aspirations into account, but have found in such aspirations probably the chief sources of their strength. The revolutionary programme contemplated a reorganization of the Russian empire on a basis of complete recognition for the cultural autonomy of Pole, Jew, Lett, Little Russian, Armenian, and Tartar. When a huge fabric like Russia can be shaken by the forces of national autonomy, it is too early to say that the day of the minor races has passed.

In contrast to the sympathetic treatment which Slav, German, and Hungarian receive in the present book, the hostile tone toward the Jews is strikingly noticeable. That anti-Semitism should exist in Austria is quite comprehensible, but that the Jews should everywhere be the unmitigated force for unrest and evil which they are represented to be, is improbable. Much, of course, depends upon the point of view; but that point of view is open to serious question when we find it solemnly asserted that the Jewish capitalists, having by their oppressive method given rise to the Anti-Semitic Christian Socialist movement, have sought to oppose to it the International or revolutionary Socialist movement, as it thrives in Germany and France. As a matter of fact, the Social Democracy of Europe has its bitterest enemies among the Jewish financiers and industrialists.

The Political History of England. Vol. VII., 1003—1660. By F. C. Montague. New York: Longmans, Green & Co. $2.60 net.

Professor Montague's volume may be placed at about the average of those that have already appeared in this series. It is obviously, perhaps inevitably, dominated by the enormous labor and accomplishment of S. R. Gardiner in the same field. But it is careful, it keeps closely within the limitations set by the editors, and there is no serious fault to be found whether of omission or commission. Such criticism as must be made depends more on causes that go beyond the author to the editors, and beyond the editors to a whole school of thought.

And first let us quote from Professor Montague. He says: "Above all, the reign of James divides with the reign of Elizabeth the honors of the most splendid period of English literature. To that reign belong the later plays of Shakespeare and nearly all the plays of Beaumont and Fletcher, as well as the noblest monument of English prose, the authorized version of the Scriptures. The same reign witnessed the birth of a new intellectual movement in the publication of the *Novum Organum.* The King seems to have had little feeling of these marvels." But Professor Montague, with amusing naïveté, shows no more feeling than James I., for that is every word he has to tell us on the subject. Turning from intellectual and literary matters, we find that economic causes receive scarcely more attention, and so another profoundly significant side of the reign of James I. is almost lost sight of—witness the insufficient treatment of the Statute of Monopolies. To take another aspect of the matter, we are given a narrative that presents in proper sequence a condensed account of each one of the exploits of perhaps the greatest of English admirals, Blake, but there is not one word indicating the character of his genius or explaining that of his methods.

By such illustrations as these it is gradually borne in on the reviewer that although the high praise bestowed on this series in earlier notices must be continued yet as the volumes accumulate certain deep seated weaknesses begin to show more con-

spicuously. And the obvious enough answer that the editors will make is insufficient. If told that their work is narrow, they will answer that it is so because of a necessary limitation; that their history is intended to be exclusively political, that it is only on this condition that it could be brought within reasonable compass. This line of argument would be unimpeachable if brought forward by a single scholar; is it not, however, dangerous when brought forward by a group of scholars formed as this one is? With the president of the English Historical Society, and the editor of the *English Historical Review* at their head, and representing the strongest school of historical study in England, it is not too much to say, taking many other facts into consideration, that these writers and teachers are setting up something like a formula for historical writing, and a formula that is open to the gravest objections. Is the historian to be commended who gives us the exact number of ships Blake had at Santa Cruz because he has read the return among the Admiralty papers, but makes no attempt to paint Blake's character or to describe his methods because he fails in the necessary documents and the equally necessary historical imagination? Must a whole school of historians be drilled to write a mediocre style to satisfy the fear of rhetorical exaggeration or to level down to a proper academic standard? Are we to continue indefinitely the process of cutting down the province of history so that the historian, after losing all hold of economics, of law, of literature, of art, and of theology, can go on ridding himself even of biography? We are getting perilously near this when we are presented such an unreal, that is untrue, Oliver Cromwell as in this book—a Cromwell indulging in no practical jokes, delivered from the wart on his nose, and, more important, emasculated from those volcanic bursts of insight, energy, and temper that constituted his genius and make him the most forceful figure of English history.

Vancouver's Discovery of Puget Sound. Portraits and Biographies of the men honored in the naming of geographic features of Northwestern America. By Edmond S. Meany. New York: The Macmillan Co. $2.50 net.

This is a valuable contribution to the early history of the Puget Sound region of the State of Washington. For it gives, in addition to a reproduction of that part of Vancouver's journal narrating his explorations there, much information in regard to him and other persons. The editor, Professor Meany, has been successful in identifying all but a few of the persons for whom the prominent natural features of the Sound have been named, and brief biographies of them are to be found in his notes to the journal.

Of Vancouver himself not much could be learned in addition to what the account of his expedition, published in London after his death in 1798, contains. Even the date of his birth is only approximatively known. But "at what would now be considered the tender age of thirteen we find him launched upon his career as a sailor under the best master of that day, Capt. James Cook." He served under the great navigator in his second and third voyages, and narrowly escaped meeting the same fate as his commander. The latest biographer of Cook, Arthur Kitson, says that he was rescued by a chief. Vancouver spent some winters in the Sandwich Islands a few years after this, and a missionary there learned "that the natives loathed the memory of Cook, claiming that he and his sailors brought a disease there which developed into leprosy. On the other hand, those natives loved the memory of Vancouver." On his return to London, in 1780, he received his commission as lieutenant, and was in active service till 1791, when he was appointed to the command of an expedition. His instructions were to survey the western coast of America from 30 degrees northward, and he was also to represent the British Government at Nootka, where a Spaniard was to be sent to fulfil the terms of the Nootka Convention between Spain and Great Britain of October 28, 1790. In April, 1792, he entered the "supposed" Straits of Juan de Fuca, which is the part of the voyage, lasting four and a half years, with which this volume is concerned, and in October of the same year concluded his negotiations with Señor Quadra, the Spanish representative. His work as an explorer Professor Meany characterizes as "remarkably well done, and the maps are marvels for accuracy under all the circumstances. The observations of the soil, the climate, the trees, flowers, and birds are surprising when one remembers the newness of all to members of the party. Especially valuable and interesting are the recorded observations of the natives. Their houses, canoes, weapons, clothing, food, and language, all were commented upon in a way that will always prove of help to the student of these aboriginal peoples." The excellent English of the journal, which is certainly extraordinarily good considering the fact that it is the product of one whose schooling ended with the beginning of his teens, and whose reading must have been very limited, may be appreciated from this passage describing his impression of the site of Seattle:

> To describe the beauties of this region will, on some future occasion, be a very grateful task to the pen of a skilful panegyrist. The serenity of the climate, the innumerable pleasing landscapes, and the abundant fertility that unassisted nature puts forth, require only to be enriched by the industry of man with villages, mansions, cottages, and other buildings, to render it the most lovely country that can be imagined; while the labor of the inhabitants would be amply rewarded, in the bounties which nature seems ready to bestow on cultivation

The journal itself is a very detailed description of the experiences of each day, the most interesting parts being those relating to the natives. On one occasion, Vancouver invited some natives to dine with him. On being offered some venison pasty, "they received it from us with great disgust, and presented it round to the rest of the party, by whom it underwent a very strict examination. Their conduct on this occasion left no doubt in our minds that they believed it to be human flesh, an impression which it was highly expedient should be done away. To satisfy them that it was the flesh of the deer, we pointed to the skins of the animal they had about them. In reply to this they pointed to each other, and made signs that could not be misunderstood, that it was the flesh of human beings, and threw it down in the dirt, with gestures of great aversion and displeasure. At length we happily convinced them of their mistake by showing them a haunch we had in the boat, by which means they were undeceived, and some of them ate of a remainder of the pye with a good appetite."

In addition to his notes and biographical sketch of Vancouver, Professor Meany gives an account of the early history of Nootka Sound, in which it is interesting to note that, as every vessel sailing under the Stars and Stripes came from Boston, in the Indian language "Boston-man" means "American." There is also a sketch of Señor Quadra, the Spanish representative, the negotiations with whom for the surrender of Nootka form the subject of the closing chapter of the work. If a second edition should be called for, we trust that a map of the Puget Sound of to-day may be added to the reproductions of old maps and charts, since it would prove a great help to the reader in locating historic places. The numerous portraits of noted persons add greatly to the attractiveness of the volume.

Das Leben des Heilands. Dargestellt von Gustav Frenssen. New York: G. Stechert & Co.

Just when there is an apparent ebb in the tide of hostile criticism of Holy Writ, and Harnack and others have receded from much that they at one time taught, Frenssen, acknowledged one of Germany's leading men of letters, and for ten or twelve years a Lutheran pastor in the established Church of Prussia, appears with a flat-footed unitarian conception of Christ, based, as he claims, on the discoveries of scholars and the changed attitude of the Church. The book is an elaborated and somewhat altered presentation of the author's view of Jesus given the world two years ago in the "Hilligenlei," and, to assure the reader that it is no mere fancy picture, Frenssen cites Harnack, Weinel, Schiele, Baumgarten, and other commentators as his authorities. That which strikes the attention at once is the dissimilarity of the diction to Biblical phraseology, the stamp of Frenssen's own picturesque style. Joseph and Mary are mentioned, but there are no disciples, no traitorous Judas, and no denying Peter. Neither is there anywhere mention of the miracles of Jesus, although his parables are paraphrased. It is natural, therefore, that the birth of Christ should be treated as an ordinary event, and it is perhaps equally natural that Jesus should be nonplussed by the questions propounded to him, and quite unconscious of his mission until touched by the enthusiasm and deference of the strange preacher, John the Baptist. "There were people in the village who questioned him concerning great things; but he looked down at the ground and reflected: it was too difficult for him to answer."

That which clothes Jesus with Divine attributes, which credits to him supernatural deeds and certain sayings, is but the accumulated myth of ages, piously gathered together by his followers, honestly believed

by many. These Frenssen will reject, and with them the doctrine of the Mother of God, the Apostles, the Pope, and the mass. All these God has condemned, through science, to death. He will banish also the doctrine of the Trinity and the Fall of Man, the Eternal Son of God and Redemption through his blood, and the Resurrection of the body. These things make one neither happy nor holy. At any rate, they have nothing to do with faith, they are matters of knowledge, and perverted knowledge, which German investigation has annihilated. In their time, they may have been beneficial to mankind, but now they are obsolete and harmful. One thing that Frenssen is willing to acknowledge and appropriate of Jesus is his fiery, loving soul, out of which came the inspiring resolution: "I will love God with all my heart, and my neighbor as myself."

England and the English. By Ford Madox Hueffer. With Illustrations by Henry Hyde. New York: McClure, Phillips & Co.

In this book Mr Hueffer gives us a picture of England as she appears to one whose German parentage on the father's side—his maternal grandfather was Ford Madox Brown, the pre-Raphaelite painter—frees him from any suspicion of insularity. Having grasped the fact that very few English people can be induced to read a book about England, he addresses himself in a preface to Americans. Here is an antidote to the tour of the sights which leaves an American visitor far better informed about historical monuments and the homes of distinguished Englishmen than any English resident, but without any real insight into the lives and ideals of the English of to-day. To lack that sympathy is to miss half the enjoyment. Mr. Hueffer accordingly avoids all that archæological and topographical information which the English themselves never envisage, or only with a genial contempt for what absorbs the attention of tourists in general.

It is much easier to write about the famous streets and buildings of London and the men who have made them interesting than to interpret London's soul. What London means to the provincial immigrant, how he is assimilated, how ignorant the born Londoner must remain of all but his own corner in that vastness, how London works and rests, what London means to the poor and the middle class, Mr. Hueffer describes with great industry and sympathy. He has little or nothing to say of London at play, that favorite theme of two-thirds of this sort of literature. The "atmosphere" of all these countless industries and interests cannot, of course, be accurately reproduced in something under two hundred pages, but the spirit of the place where so many English live together, its sinister power, its great toleration, its infinite variety are conveyed to the reader in such a way that one regrets that Mr. Hueffer did not devote his whole volume, as Mr. Hyde has devoted all his illustrations, to the story of London life. In his studies of the countryside he gives us some excellent descriptions of types, always of the poor, and of typical episodes, such as country auctions, sheep-shearing, and the like. The whole makes excellent desultory reading. It is a pity that a volume otherwise admirably got up should be marred by so many errors in proofreading. Their number is inexcusable, and there are many cases where the substitution of words or letters makes whole sentences unintelligible.

Canada. Painted by T. M. Martin; described by Wilfred Campbell. New York: The Macmillan Co. $6 net.

Some of us know our Canada thoroughly in spots; others have a superficial appreciation of the entire country; but there are very few to whom the charming series of paintings by T. Mower Martin, R. C. A., here reproduced in color, will not come as a revelation. Mr. Martin's task has been a labor of love. It is the product of no perfunctory journey. To have seized so unerringly the distinctive beauties of every quarter of this great country, the artist must have explored it from end to end; from Cape Breton to Vancouver Island. The same brush has caught the peculiar charm of the old Acadian country around the Basin of Mines, with its quaint suggestions of a transplanted Holland; the rugged beauty of the Gut of Canso; the ancient capital on the St. Lawrence, with its crowding memories of other days and other ways; the wild scenery of the Muskoka Lakes; the rich coloring of the autumn prairies; the grandeur of the Canadian Rockies, and the almost tropical luxuriance of British Columbian valleys. This series of paintings, some seventy-seven in number, forms by all odds the most complete and adequate interpretation of Canadian scenery that has yet been published. Where all are admirable it is almost idle to pick and choose; yet here and there one lingers over a view that appeals with peculiar force, perhaps because of its power to bring back remembered scenes: an autumn road near the Bay of Fundy; an old-fashioned New Brunswick farm; evening mists on Muskoka; out on the prairies; Ross Peak, in the Selkirks; the Pacific coast near Sechelt; the valley from Rogers Pass; and the Illecillewaet below that noble peak Sir Donald, the last fittingly chosen as a frontispiece.

In selecting Dr. Wilfred Campbell, the well-known Canadian poet, to write the descriptive matter for this book, the publishers made on the whole a commendable choice. Dr. Campbell's idea has been to "describe the great natural features of the land, in its broader characteristics—its coasts, rivers, mountains, lakes and prairies, those physical beauties and sublime effects of nature for which the region is specially famous. With this he has attempted to depict the seasons, and the beauty of the Canadian woods." So far as these are concerned Dr. Campbell's contribution to the book leaves little to be desired. It is to be regretted, however, that in the effort to attain a completeness not essential to a work of this nature, he has entered into comparatively unimportant details, savoring rather too much of the popular guide-book. Dr. Campbell is not at home in this kind of writing, and the effect is to mar an otherwise effective piece of descriptive work. It leads him, for instance, into the error of naming Vancouver as the capital of British Columbia; and giving a wrong title to the Roman Catholic college at Toronto. These, however, are not very serious blemishes, and many of the chapters, notably those on the Lake Region, and the Canadian Seasons, form a perfect commentary on Mr. Martin's pictures. A perhaps novel feature of the text is the introduction of numerous descriptive passage from Dr. Campbell's Canadian poems.

Science.

The Dillenian Herbaria. By G. Claridge Druce, Curator of the Fielding Herbarium. Edited with an introduction by S. H. Vines, Sherardian professor of botany, in the University of Oxford. New York: Henry Frowde. $4.15.

The technical account of these three herbaria would not in itself be interesting to a general reader, were it not for sundry introductory notes and fragments of letters. But these fragments have the charm which clings to a great part of eighteenth-century science, and carry one back to the days when naturalists did not confine themselves to single and restricted fields. Dillenius was born in Darmstadt, in 1684, and was educated at Giessen. He early became a writer on natural history subjects, taking a wide range. In 1715 he discussed the American plants which had become naturalized in Europe, and next gave a description of "Cahve" (coffee); following this with an account of various coffee-substitutes made by himself by roasting certain seeds and grains. He insists that the drink from roasted rye was the best, being "with difficulty distinguished from the Arabian berry." Of course, after this, our readers are not prepared to think that Dillenius could be a man of much discrimination, but such, in fact, he really was. And, furthermore, he was what may be called a broad student. To indicate the wideness of his studies, allusion ought to be made to his special examination of the effects upon himself of opium, which he himself made from *Papaver somniferum* grown in Europe.

His principal work in botany was in the group of mosses and their allies, and his success in this work was so great that it attracted the attention of an English botanist, Consul William Sherard, who had brought back from the Orient a large collection of plants, and who desired to find a competent assistant. Sherard engaged him for this new task, and employed him also to aid him in a treatise on the synonymy of plants, and in the preparation of a new edition of Ray's "Synopsis of British Plants." But for fear that the name of a young foreigner might prejudice the sale of Ray's work in Britain, Dillenius was not mentioned on the title-page; consequently he received little credit for his labors. But he had already in hand a "History of Mosses," and from this he soon became widely and favorably known. The work was published under the title of "Historia Muscorum," and found its way into the libraries of collectors of various degrees of intelligence. For instance, Sir James Edward Smith had the delight of seeing a copy of the work standing "fairly lettered and untouched on the shelf of a collector, as a History of the Muscovites."

Dillenius had many annoyances, even af-

ter he had accepted a scantily endowed professorship at Oxford. Many of the trials came from controversies with men less learned than himself, who had a happier manner of attracting attention, but he had also more agreeable experiences upon which he was pleased to dwell. One of the most interesting of these was a short visit from Linnæus, who was regarded hy him at first rather as a disturber of things in general, but whom he came to know as a safe and friendly associate. Dillenius readily gave up the cumbrous nomenclature in vogue for the simpler names suggested by Linnæus, and this change was in itself no slight event. In the lists before us, the older complex Dillenian names of genera and species stand with their Linnæan substitutes. A few examples will indicate the sweeping nature of the substitutions. Papaver laciniato folio capitulo breviore glabro annuum, Rhoeas dictum, becomes Papaver Rhoeas of Linnæus. To Lysimachia speciosa, quihusdam Onagra dicta, siliquosa, is given the simpler name of Epilobium angustifolium. The hinomial nomenclature of Linnæus constituted in itself a revolution. Concerning his relations with Linnæus the following citation from a letter of Linnæus to Haller is in point:

> You cite Vaillant and Dillenius whenever you wish to give an example of any faults. Who has avoided errors? Happy is he who has committed the smallest number! I would not, if I could, pick out the faults of good authors.

The first edition of "The English Flower Garden and Home Grounds," by W. Robinson (imported hy Charles Scribner's Sons), was puhlished more than twenty years ago. Each new edition has received new matter, and the author has succeeded well in his endeavor to bring the handbook up to the times. Of course a work like this is designed primarily for the great class of amateurs who have money to spend on tbe most delightful pastime and the purest pleasure in the world. To those who make a business of horticulture for the sake of gain, other handbooks are to be recommended; to those who love to plan their own pleasure-grounds and make their own choice of plants, this is one of the best treatises within reach. It is, moreover, written in such a pleasing style that it might even serve to wean from idleness those who now depute to professional gardeners the task of selection and care of plants. Mr. Robinson has done so much and such varied editorial work that he knows the value of a dignified and yet familiar treatment of his subject, and therefore makes his pages always readable, even when the matter itself is not very interesting. With the caution which seems hardly necessary, namely to remember that some of the statements regarding English garden plants are not applicable to our garden plants here, the book may be heartily recommended to all lovers of cultivated flowers. The volume of almost a thousand pages is fully illustrated with good engravings which are well selected. But we venture to hope that the next edition will not have the full-page illustration (149) in which an indolent or somnolent person is stretched near a bed of gentians, in a most unbecoming posture. Other units of measurement than a Brobdingnagian human form can be found, we are sure.

Louis Lapicque, lecturer at the Sorbonne, has worked out graphically the vexed question of the relations of the weight of the brain, weight of the hody, and intelligence in the species of the entire animal kingdom. Discussions heginning with Cuvier have come to no certain conclusion. Taking the hrain alone, the whale has five times as much as man. Taking the weight of the body into account, the ouistiti ape and linnet are superior to man. Gratiolet summed up the investigations: "The weight of the brain has no more importance for intelligence than the weight of a clock for its accuracy in marking time." M. Lapicque makes an ordinary table for logarithmic graduation: equal intervals horizontally, indexed 1, 10, 100, 1,000 etc.; and the same vertically. To this he applies the coördinates: for each animal the weight of the body gives the abscissa, and the weight of the hrain the ordinate. The resulting lines are parallel for the same family according to the different sizes of the animals—for example, cat, panther, lion, or teal, wild duck, swan. In the entire range of the animal kingdom, these "isoneural" lines fall at different heights: fish and reptiles lowest; next rodents, birds, marsupials; then carnivora and ruminants; higher still, anthropoid apes; and, highest of all—distinctly above all other animals—man. The same inclination of isoneural lines brings animals of hig body as well as hig hrain, like the whale, into the group of ordinary mammals. By this treatment of the body's mass in the problem, the relation of brain size with intelligence comes out clearly at last.

During the season of courtship and later, most species of snipe belonging to the genus Gallinago perform a remarkahle aerial evolution, dropping from sixty to eighty feet through the air, at the same time producing a curious humming or bleating sound. This is common to species in all parts of the world and has been variously explained as vocal or by the action of the wind passing through the wing or tail feathers. P. H. Bahr, in the last Proceedings of the Zoölogical Society of London, has finally settled the matter, proving that the secret lies in the outer pair of tail feathers which, when the tail is widespread, are somewhat isolated from the others. By fastening these two feathers to a cork and string and whirling them around the head, the characteristic bleating sound is produced, this effect being impossible with the wing feathers or other tail feathers. In our common American snipe the outer tail-feathers are hroader than in the European hird, and the sound produced is of much higher pitch. It is a satisfaction to have a world-wide phenomenon of bird life such as this, which has been so long in dispute, clearly and logically explained.

The Imperial Cabinet of Japan has just issued a work of great interest to the student of pathology, showing the movement of population in the empire during the year 1904, in 357 ample pages. Minute details of births, marriages, divorces, and deaths are given and the diseases classified under forty-six heads. Various other items regarding foundlings, foreigners etc., exhibit a passion for detail and accuracy, which enables the Government to know to a fraction the national resources. Compared with statistics of two or three decades ago, the decrease in the number of deaths from kakke, or heri-beri, is striking. Tuberculosis, meningitis (simple), and enteric disorders still show high figures.

Drama and Music.

The Development of Shakespeare as a Dramatist. By George Pierce Baker. New York: The Macmillan Co. $1.75 net.

Professor Baker's book offers a somewhat more comprehensive survey of Shakespeare's growth as a playwright than has yet been attempted, inasmuch as it is not limited to the study of a few selected plays, but traces his development from the beginning to the end of his career. The first two chapters—on Elizabethan audiences, the peculiarities of the Elizabethan stage, and the conditions which surrounded both actor and dramatist—are introductory to the main object of the book, hut they have a value in themselves, since they give sound information in a rather fuller form than has hitherto been accessible to the general reader. The author's experience in the revival of Elizabethan plays at Harvard has been of advantage to him in the discussion of the technical details of stage-construction in this period. Among other things, he very properly urges—what was often forgotten after the first discovery of De Witt's drawing of the Swan Theatre—that there must have been great differences in the arrangements of the various Elizabethan play-houses. It is also a valuable feature of the first chapter that our author endeavors to fix exactly what advance had been made hy Shapespeare's predecessors, especially Marlowe and Greene, in the art of constructing plots. This relates directly, of course, to the main subject of the book—the manner in which Shakespeare acquired his mastery of this art. There is a certain drawback to all such discussion, inherent in the subject itself. For, after all, there is no norm in such matters. The variety of plots that at least hold one's interest is infinite. It is, no doubt, owing to this intangihility of the suhject-matter that we have so few formal discussions of this aspect of Shakespeare's production, such as the present work. Different readers, however, will doubtless feel this drawhack in different degrees.

In the chapters which trace Shakespeare's development as a dramatist through the successive periods, Professor Baker's methods and conclusions, it strikes us, are generally sound. But leaving aside the question of the authenticity of "Titus Andronicus," in which we differ from Professor Baker, we cannot but regard his minute examination of the dramatic effect of this play, scene hy scene, as an instance of analysis overshooting the mark. As a matter of fact, in the actual production of the play not one person in a hundred would probahly feel all or even many of these impressions of the closet. It is only the broad effects that a critic need concern himself with, and he may account himself fortunate, if he gains the assent of the

majority of competent judges even as to these. Why, we may ask, should Professor Baker base so much of his discussion on plays of doubtful authenticity, like this, or confessed adaptations, like the Henry VI. plays, yet exclude from consideration "Measure for Measure" or "Troilus and Cressida," because of probable or possible collaboration? It seems to us, moreover, that distinctions between the different dramatic *genres* occupy too large a place in our author's mind. Among the English-speaking peoples, at any rate, such distinctions have never worried either dramatists or audiences—least of all, in the greatest period of the English drama, as Professor Baker himself recognizes. It is doubtless this tendency which leads him to advance the theory that Shakespeare ceased to write chronicle plays, because, owing to the ill-defined character of this troublesome *genre*, it developed on the one side into romantic comedy and on the other into tragedy. We do not see why such a theory should be necessary in face of the fact that before he had practically written any independent chronicle plays at all, Shakespeare had already produced a tragedy in "Romeo and Juliet," and a romantic comedy in "Love's Labour's Lost," not to mention the "Comedy of Errors" and "Two Gentlemen of Verona," which contain both comic and romantic elements —plays which, to be sure, owing to the author's immaturity, are in every respect inferior to those of his period of High Comedy, as Professor Baker has chosen to call it. It is more likely that Shakespeare stopped writing histories simply because the novelty had worn off plays of this kind, which had come into popularity in the days of the Armada. Besides, he had used up the historical material which was of most interest to his audiences.

We think that it involves a misconception, moreover, when Professor Baker speaks of "Shakespeare's desire to fulfil at one and the same time his own wishes as to characterization, and the wish of the audience for a story." If any such opposition had actually existed in Shakespeare's mind, he would have been much more modern but certainly a poorer dramatist, and he would never have been able to effect that union of the two elements in his plays which, as Professor Baker says, is perfect. The view of the relative unimportance of incident which is implied in these words is doubtless one of the things which have prevented our modern playwrights from creating anything of more than ephemeral interest.

In conclusion, we wish to commend the general sanity of Professor Baker's work and his thorough sympathy with his author. For instance, we breathed a sigh of relief when we found him confessing his conviction that Shakespeare did not intend Shylock to be a comic character. The illustrations constitute a valuable feature of the book. They embrace the most authentic maps of Elizabethan London, all illustrations that throw light on the construction of the Elizabethan stage, and many other things that help us to an understanding of the drama of the period.

Paderewski's symphony is completed save for a few details in the orchestration. It will be played first by the Boston Symphony Orchestra, and next spring in London. Paderewski's American tour, beginning in the autumn, will include seventy concerts.

Paris has so far heard only two of Wagner's Nibelung operas, "Walküre" and "Siegfried." The other two are to be performed next year; Messager and Brussen have just made the arrangements with the publishers of the scores. The chief difficulty confronting the Parisian managers is that they have only a few singers who can do justice to Wagner, and no first-class conductor.

Apparently they are going to substitute the laryngoscope for the ear at the Paris Conservatoire, in determining the chances of a candidate. At any rate, a book has just been issued entitled "La voix, sa culture physiologique" by Pierre Bonnier, who is a lecturer at that institution, and who closes his volume with details regarding the results obtained by a clinical examination, by laryngoscope and otherwise, of the voices of forty-four persons. Of that whole number only eight were chosen, the others being rejected as having such qualities that no amount of training could efficiently fit them for a *carrière lyrique*.

In January, 1905, the Italian publisher Ricordi offered a prize of $2,500 for the best opera by a British composer. The successful opera was to be produced this summer in London, and the composer was to get in addition to the prize a royalty of 40 per cent. of the fees received by the publishers for any performance of the opera. When the Covent Garden season came to an end last month, and no prize opera was announced by Ricordi, some began to impugn his good faith. Inquiries showed, however, that more scores had been received than had been expected, and that some of the judges—among them Massenet and Hans Richter—were busy men and could not be hurried.

Art.

THE SEVENTH INTERNATIONAL; VENICE.—I.

The great popularity of the International Exhibition held biennially at Venice is easily explained. The show is not too large; the galleries are well lighted and single hung; the halls, being frequently decorated by delegates or societies of the exhibiting nations, constitute a record of contemporary taste in furnishing and interior design. Besides these features, a liberal extension of invitations secures a fairly high level of contributed painting and sculpture, while the management usually provides as well several groups of works representing the more recent achievement of prominent artists. This year Blanche, Mancini, Sargent, and Zorn are thus honored, not to mention such newcomers in the international field as Axel Sjöberg, Anna Boberg, and others. Finally, the pictures actually sell. Perhaps a third have found purchasers at this date, and often to the solace of a sale is added the distinction of patronage by Italian municipalities or royalty. No wonder that the more enterprising modern artists are glad to show at Venice.

International the exhibition is, however, only in a limited sense, and this because of the inevitable preponderance of Italian contributors. Obviously the artists of Italy have every convenience for presenting their works to the jury, whereas foreigners, except a few in passage, usually wait to be invited. So once for all the ungracious observation must be made that the deadweight of native mediocrity is the bane of the show. But since about 450 artists are present by invitation as against 148 who have passed the jury, the case is not as bad as it might seem. And concerning these competitive exhibitors, the jury, consisting of Trentacosta, Chitarini, Brangwyn, Dettman, and Bistolfi, give exceptional assurances. No work that has not seemed "the product of a true, intimate, and sincere feeling for art" has been admitted. The statement is probably no more misleading than are protocols generally.

The leading features of the exhibition, to the present writer, are the groups of paintings by three great technicians, Zorn, Sargent, and Mancini; the decorations of the Central Hall by Sartorio, the installation of the exhibit of the Austrian secessionists, in Hall VII., and the Russian exhibit as a whole. One should add, perhaps because of an evident intention to please or surprise, the new Belgian pavilion, and the gallery devoted to symbolistic and pseudo-imaginative art under the impressive title "The Art of The Dream" (*l'Arte del Sogno*). If only as the most ambitious work presented, Sartorio's great mural paintings deserve first consideration.

These panels cover the walls of the central hall, which is devoted to the larger sculptures. The room is a long oblong, with splayed corners and wide doors at the centre of the four sides. The longer walls thus afford four oblong panels, while the ends are so narrow, and the doorways so wide that only the two tall panels on the splays near the entrance are available for decoration. To effect a transition between the long and the tall spaces, the painter has introduced high flanking panels on either side of the four main spaces. In this manner ten tall compositions filled with caryatids in groups of three support the more pictorial oblong compositions. The subject is an allegory of life. Light, Shadows (the struggle with error), Love and Death are the titles chosen by the artist. In the first panel the new-born infant is shown attended by the Fates and the Furies, while below the Hours dance. In the second Youth as a mounted archer charges upon the forces of Error, while below float the ambiguous forms of the Harpies, Fauns, and Sirens. In the third decoration the forces of Chastity fight with Lust, symbolized by tigers and mænads; below are stories of pure and venal love typified by Psyche and Fortune. In the final composition the horses of Death preceded by Dreams rush across the field, while lower a stricken Amazon, mothers mourning their children, and women (the symbol of the renewal of life) uphold the higher subjects. From this inadequate account of these elaborate and highly symbolical panels it may be gathered that each is in two tiers, a very agitated group of human beings and animals being superimposed upon a quieter group, the figures being nude or lightly draped. This two-story motive is effectively repeated, but in severer form, in the

ten tall panels in which a crouching male caryatid bears up a plinth supporting the erect and lighter figures of a youth and maiden. The relief of the figures is fully, at times almost brutally, indicated, and since the color is restricted to bistre and pale green, the effect is fairly sculptural.

Technically, I can hardly imagine a more unhappy scheme. Many of the nudes project so far from the picture plane that they have the appearance of being literally pinned to the wall; the whole impression is one of restlessness and exaggeration, and yet, with its obvious defects, the work is far from commonplace. It not merely is imaginatively conceived, but it abounds in individual beauties. The nudes, despite coarse attachments and extremities, are drawn with vigor, at times exquisitely. In particular, the tall panels present poses of great originality and impressiveness. In short, one must hail an inventiveness as exuberant as that of the old masters, while regretting also a possibly inevitable deficiency in taste and manual skill. I confess to finding work of this robust and original sort far more interesting than the tame and safe eclecticism of the followers of Puvis. In kinder times for the painter's art, Giulio Aristide Sartorio would probably have been a great decorator; as it is, he has perhaps achieved all that one man may hope to do, in a time when painting has broken with the sound tradition of the past. His failure, if we must call it such, is, after all, of the magnificent sort.

Mancini, Sargent, and Zorn are three names to whet the curiosity of the most jaded gallery-goer. They represent in various moods the latest and most brilliant attempt at a swift, synthetic, and luminous draughtmanship with the brush. Sargent and Mancini exemplify, as well, a distinctly personal and interesting attitude towards their sitters. Mancini shows no less than eight canvases, mostly portraits, in the Roman Hall. These studies have a vividness that is strange, when the arbitrary lusciousness of the method is considered. All the old mannerisms are in evidence. Not only is the paint loaded on in cakes, and the high lights stuck on by means of bits of glass, paint tube, silvered paper, or other studio sweepings, but these devices are generally used for the most trivial purposes—to give relief to a clarionet, to render the glow of an orange. Yet across all this affectation, one gets an extraordinary vital impression of reality. Take the portrait of Signor Otto Messinger, in a gilt chair against crimson plush. It is hot, garish, and uncomfortable, but it is an unforgettable evocation of a personality. In the genre portraits (fruit and flower venders), one notes again a modelling remarkable when the looseness of the touch is considered, a true sense for textures, and an atmospheric envelope that is none the less real for its tropical and romantic suggestiveness. We have to do with a very great talent, half obscured by whim. Whether posterity will even have the chance to judge either the talent or the eccentricity is doubtful. These pictures seem doomed to swift disintegration. One of them, The Musician, is already in a way to shed its paint, and the others will surely follow. As evidence of the anarchy into which the practice of painting has fallen, Mancini's case has a typical significance.

There is so little new to be said about Sargent's achievement that one would prefer to let his six portraits in the English section be read by title only. Learned societies frequently find this method preferable to a reading in full. But Mr. Sargent looms too large in the admiration of the laity to permit his feebler efforts to be slurred. When he indulges in such insipid prettiness as is displayed in the portrait of the Countess of Warwick and her Son, when his canvas lacks both tone and character as in the group of the three Misses Acheson, when he shows a tendency to elongate all his sitters to ten heads strong, the public should be warned that what amazes it is merely specious, and not even that to a sensitive eye. Happily, in the portrait of F. C. Penrose, the architect, of Gen. Ian Hamilton, and of Lord Biddesdale in hunting costume, one may see Sargent quite at his best. In a clean and forthright draughtsmanship that renders simultaneously form and character, these canvases can hardly be surpassed in our times. The more exquisite magic of the brush, the deeper sense of style, has apparently been denied this gifted and fortunate painter, but his manner has a rare exhilaration at its best to experience which we must go back to his greater prototype, Frans Hals. If one scrutinizes anxiously certain lapses in his later production, it is from a friendly solicitude. He is approaching artistic maturity, a climacteric which leads always to placid acceptance of the approved formulas or to new and higher adventures. One would rejoice at some hint that his mastery is of the sort that mellows.

Anders Zorn is so frankly and solely the consummate workman, that criticism is disarmed before the succession of splendid vouchers of craftsmanship that he unflaggingly presents. It is idle, because so obvious, to say that this workmanship ends where art begins, having no element of creation or imagination. And yet for the crowd it might not be superfluous to label all the Zorns: "Merely an Example of Magnificent Painting." It might save some puzzling over the meaning of these five nudes, so blankly strong and naked, beside their brooks or in their cabins. They mean nothing, of course, except that a sure hand has recorded what a piercing eye has chosen to see. There is no fine impression of art in any of these figures, indeed, there is no such intention; but how gloriously the specific, untransmuted beauty of muscle, bone, and pale skin is conveyed. There is something tonic about this work, as there is in anything supremely well done. Take such a picture as that of the nude Swedish girl who stands tense in the gloom while she holds a white bearskin to an open fire. It will at least serve to prove to posterity that we were not all duffers at the opening of the twentieth century of grace. Meanwhile, such painters as are seeking a technic will hardly find a better example than that afforded by the direct, precise, and potent brush of Anders Zorn. Something of the same impersonal attitude towards nature is revealed in the group of Arctic studies which Mme. Anna Boberg contributes, and in the wild fowl of Sjöberg. Much of this painting appears to have been done in the open air. It has remarkable actuality. Indeed, the Swedish room is the most livable of all, even if its austerity approaches dryness. M.

Finance.

THE STANDARD OIL DECISION AND THE STOCK EXCHANGE COLLAPSE.

The violent break which has occurred on the Stock Exchange since August 3, when Judge Landis imposed his $29,240,000 fine on the Standard Oil, will doubtless occasion wide discussion as to its actual cause. The extent of the decline has been sensational; thus, during the week which followed the announcement of the penalty, Union Pacific stock fell 17 points, Reading 12¾, Chicago, Milwaukee and St. Paul 10⅝, Amalgamated Copper 10½, New York Central 6⅛, Southern Pacific 8⅛, and American Smelting 14⅝. This decline continued with great severity at the opening of the present week. Standard Oil stock itself, which, for a day or two after the announcement of the sentence, held reasonably firm around its previous price of $500 per $100 share—a price regulated by its 40 per cent. dividend—has since then fallen with great rapidity to $421; a price, incidentally, which compares with $700 early in 1906, when the proceedings against the company were first mooted.

There had, it is true, been a considerable decline in Stock Exchange prices during the week before Judge Landis's decision; but the fact that the fall began with full violence on the very next business day after the decision was announced, has led to a widespread inference in financial circles that the sentence on Standard Oil was the direct and single cause of the break in stocks. In some quarters, belief is still held in the old-time tradition of a Wall Street "object-lesson," by which was meant the sale of stocks by important financiers, with a view to causing demoralization among investors, and thus proving to the public at large the financial results of an objectionable public action. More definitely, it was asserted, while last week's decline was going on, that large investment interests had withdrawn entirely from the market since the exemplary fine on the Standard Oil and the announcement of the Government's policy regarding prosecution of other rebate cases.

In short, it is probable that the market of the past week or ten days will go down in Wall Street history as a "Standard Oil panic," and will be cited hereafter as an instance of the market upset primarily by the action of the courts or the Government. Undoubtedly there is some basis of truth in the argument; it will be necessary, however, to look a little closely into the facts before reaching positive conclusions as to the nature of the present market. It will, for instance, be recalled that when the Government's suit against Northern Securities was announced in February, 1902, and again, when the Federal court in April, 1903, first pronounced its decision decreeing the dissolution of that merger, very similar assertions were made as to the damaging results of this Government action on public confidence and on the investment markets. The theory was not without plausibility, even then, because prices of stocks were falling sharp-

ly in the early part of 1902, while in April, 1903, the so-called "rich men's panic" was beginning, and lasted almost without interruption through the four succeeding months.

Yet the curious fact about both 1902 and 1903 is that at the present time no one thinks of ascribing the action of the markets in those two years to the Northern Securities suit. Two reasons for this unquestionably are, first, that the cause at work on the markets of that period—over-speculation and over-strain on capital—became too plainly evident to ascribe the resultant phenomena to anything else, and, second, that in the face of these so-called adverse and unsettling decisions, the investment market proceeded to advance again with great enthusiasm as soon as other basic conditions were improved. There was a species of irony of events in the fact that the great recovery from the depression of 1903 began in the ensuing March, on the very day after the Supreme Court's final decision dissolving the Northern Securities. In the same connection it is only fair to recall, when the Standard Oil decision and the railway prosecutions are cited as the cause of an unsettled market, the fact that passage of the Railway Rate law in the early part of 1906, and the announcement of the Government's policy regarding the Standard Oil at the same time, were followed, not by any movement of the general depression and misgiving on the Stock Exchange, but by a violent and prolonged advance in prices.

It is therefore pertinent to ask, was there no other reason for the severe decline in stocks last week and this, except the action by the Government and the courts in the railway cases? Very few experienced bankers would fail to answer that there unquestionably were at work in the money market of ten days ago such influences as were bound, sooner or later, to cause very much such phenomena as the stock market has just been witnessing. The case was this: Along with the now very generally admitted deficiency in supply of liquid capital for investment in new securities, the position of the world's great banks, as shown by the weekly statement, had declined to an unusually low level. The statement of the New York Associated Banks on Saturday, August 3—the very day when Judge Landis imposed his fine on the Standard Oil—showed the smallest surplus reserve reported at this date in any year but one since 1890, and that one exception was the panic year, 1893. Not only did the surplus reserve fall on that day to a figure hardly one-half of the $14,000,000 reported at the opening of August, 1906, but the figure of this year's August surplus, $7,473,000, was so small as to make practically certain the disappearance of all the surplus over the required percentage of reserve to liabilities within a week or two, unless immediate relief were obtained from some other quarter.

Such relief might have come through increase of cash holdings, or through decrease of liabilities. But cash holdings, instead of showing a tendency to increase, were decreasing with great rapidity. This is the time of year when the agricultural West calls on the East for the currency to replete its own bank reserves, and to provide for payment of farm hands at the harvest. The West is entitled to recall this currency, for the sufficient reason that it belongs to the Western banks who had deposited it in New York during the winter and the spring simply because it was not then necessary in such volume in the West, and because the East would pay for the use of it. Sometimes such outflow of cash has been offset by import of foreign gold; on the present occasion, despite a fall in foreign exchange, we were actually shipping gold to Holland, and the slightest possible prospect existed of our obtaining gold, as we did last year, from London or Paris.

As for the question of liabilities, it will readily be seen that if that side of the account were to be sufficiently reduced, a large curtailment of cash reserves could be comfortably faced without impairment of the surplus. There are usually three ways in which such liabilities of the Associated Banks may be cut down. Loans may be transferred from the New York banks to other local or interior lending institutions; they may be transferred to European banks; or, finally, the loans may be cancelled outright—in either case with a consequent reduction in outstanding liabilities. Some relief may have been in sight, at the opening of this month, through transfer of loans to other domestic institutions; but it must be remembered that these institutions also have been under a heavy strain, and that their capacity to help the New York Associated Banks was more limited than in any recent year. And exactly the same thing was to be said of the foreign lenders.

Under such conditions, bankers looking to the longer future had to consider the question, what should be done by lending institutions in the East to protect their own position? At the end of 1903, and in the early part of 1904, decided slackening of interior trade released such sums of money as to provide abundantly for the New York markets' needs. At the present time, notwithstanding constant predictions of an impending trade reaction, genuine trade activity, and therefore the industrial use of money in this country, cannot be said to have relaxed at all. There was left the expedient of reduction in Wall Street loans through a fall of prices on the Stock Exchange, and when the market of the past two weeks is surveyed from this point of view, it will be difficult to admit that the fall in prices has not been logical.

Howeyer this may be, the indirect result of the break in stocks has undoubtedly been favorable to the money market. Had the New York loan account not been reduced at all last week—it had increased nearly $4,000,000 the week before—the loss in cash reported in last week's statement would have nearly caused extinction of the moderate surplus reserve. Instead of this, the week's liquidation on the Stock Exchange, with the resultant loan contraction, cut down outstanding loans, and with them outstanding deposits, no less than $16,000,000. The result was, notwithstanding a $5,300,000 loss in actual holdings, that the surplus reserve on August 10 was actually higher than a week before.

In other words, the forced liquidation on the Stock Exchange, and the violent fall in prices which accompanied it, were a normal sequel to the position of the money markets. That the selling movement has been emphasized by doubt over what the Government's next move will be, and particularly by the attorney-general's very indiscreet public utterances since the Standard Oil decision, is not open to question. Behind even such considerations, however, stands the fact that the fall in prices has represented the quickest relief for a seriously strained financial position. When the hysterical excitement which surrounds a convulsive movement on the Stock Exchange has spent itself, it will probably be discovered that a very much sounder general position has been reached as a result of it.

BOOKS OF THE WEEK.

Calvert, A. F. Seville. John Lane. $1.25 net.
Celebration of the Seventy-fifth Anniversary of the Founding of Wesleyan University. Middletown, Conn.: Wesleyan Un.
Charmes, F., and others. Les questions actuelles de politique étrangère en Europe. Paris: Félix Alcan.
Dimmick, Ruth Crosby. The Bogie Man. Philadelphia: John C. Winston Co. 75 cents.
Education Department of the State of New York, Third Annual Report. Albany.
Gates, H. W. The Life of Jesus. University of Chicago. 75 cents.
Elshemus, L. M. Nannie. Boston: Badger. $1.

VREELAND & KOREN'S

Lessons in French Syntax and Composition

By W. U. VREELAND, Professor in Princeton University, and Wm. KOREN, Preceptor in the same. 178 pp 12mo. 75 cents net.

In this small volume the authors have attempted to state as clearly and concisely as possible all the important rules of French syntax. These rules have been paragraphed consecutively and arranged in twenty-one lessons. In each lesson are three sets of graded exercises and a number of idiomatic phrases. The book also contains forms for letter-writing, as well as connected passages for translation.

The Strength of Nations

An Argument from History.

By J. W. WELSFORD, M.A., formerly Fellow of Gonville and Caius College, Cambridge. Crown 8vo. Net, $1.75.

This is an argument from history, showing how, in the author's opinion, England built up her greatness by a protective policy, and how her Continental rivals were ruined by adhering to mediæval free-trade, e. g., it shows how the Commercial Treaty of 1786 caused the French Revolution in 1789 and the subsequent Reign of Terror.

LONGMANS, GREEN, & CO., New York

The Nation.

NEW YORK, THURSDAY, AUGUST 22, 1907.

The Week.

With the substance of the President's speech at Provincetown on Tuesday no one should quarrel. It is a stout reaffirmation of his well-known views in his well-known language. If he were to say anything at all, this was what he was sure to say. As to the need of new laws to draw the teeth of wicked corporations we feel the gravest doubt; but as to the desirability of enforcing the laws already on the statute-books honest men cannot differ. To the time and manner of this Presidential deliverance, however, we think there is reasonable objection. There was really no occasion for him just now to say anything. A dignified silence about his policies would have been better, because he had nothing new to tell us; and a prudent consideration of the strain under which the whole financial world is now laboring would have kept him from saying anything which might add to it. And, next to silence, a quieter tone would have been golden. As it is, President Roosevelt's speech reads like that of an angry man. His vehement language about the rich "malefactors" who have "combined to bring about financial stress" in order to "discredit the policy of the Government" (meaning himself), is not befitting a well-poised statesman. Neither he nor any other man has evidence of a conspiracy of rich malefactors to bring about a crash in stocks. Thus it is that though he may think his words merely breathe vigor, in reality they must impress his readers as revealing recklessness, bitterness, and a failure to understand the nature and existing conditions of credit. We believe today, as we have believed and asserted since the present complications in the markets began, that the disturbance arose from causes wholly unconnected with the Government's railway policy. Nevertheless, it is useless to deny that the feeling of uneasiness has been aggravated by uncertainty as to how far the prosecutions were to be carried. Now, credit is subtle and imponderable. It lies in the mind as much as in the bank account. When those who have money are persuaded that it is safe to turn it over to those who can use money, then credit is good. When, however, they begin to be afraid, and to call in loans and lock up funds, credit is bad. It is plainly towards the latter condition that the whole world is at present drifting, and as the causes are, in the last analysis, largely mental, it is of the highest importance that nothing to be done to heighten alarm.

Secretary Taft's address at Columbus Wednesday night was to have been a trumpet; it turns out to be a second violin. His long and rather tedious speech might almost have been condensed into the single sentence: "I say ditto to President Roosevelt." As a Presidential candidate himself, he chooses as his model Martin Van Buren, and, like him, notifies the country that his ambition will be to walk in the footsteps of his predecessor. It may be said that, as loyal friend and heir apparent, Mr. Taft could have done no less. It may also be said that the immense success, politically, of Roosevelt's railway and corporation policies, justifies any aspiring public man in trying to enter into that splendid heritage of popularity and votes. But this is not what the people were given to expect. Not for this did they wait so eagerly to read Mr. Taft's speech. From it we were to learn that he was an original, independent, and fearless statesman. It was to be a direct and ringing appeal; in fact, it is a feeble echo. So far as this utterance of the Secretary's is concerned, therefore, the country is still in the position of saying: "Why don't you speak for yourself, William?" Even on the question of tariff revision, where Mr. Taft was said to be determined to sound a virile note, he is timid and wishy-washy. A very mild and indefinite kind of tariff revision he is in favor of some time after the next Presidential election, always provided the Republican party harmoniously desires it. The Secretary is not so pronounced about it as he was in his Bath speech last September. Then he was for reducing the tariff in the "near future." A year has elapsed, and now he is talking about at least eighteen months more.

The Filipinos will be sincerely delighted by the presence of Secretary Taft at the opening of their National Assembly. He is their best friend in high office here, and most of their other friends, like the members of the famous Congressional party, were of his introducing. Mr. Taft does not judge the new representative body a failure from the start merely because a large majority of its members are advocates of immediate independence. "I am satisfied with the results attained," he says, having in mind the training in self-government which the deliberations of the new legislature will furnish. He adds:

> The United States is trying to show that the Anglo-Saxon ideals of self-government can be successfully applied to a Malay people. We are proving that they can. Whether the Philippines will remain permanently a part of our domain is a question.

These are statements about as far removed from the Beveridge philosophy as anything the anti-Imperialists have said. What must not be forgotten is that, however broad, tolerant, and humane Mr. Taft's own views may be, his policies have been blocked year after year by the majority of his party in Congress. Any one who chooses may, of course, describe Taft's attitude toward the Filipinos as that of the present Administration; but the record of Congressional action on the tariff, the shipping bill, and the railway subsidies is anything but in accord with it.

It has been known for some time that Secretary Root and Ambassador Bryce were hard at work on a treaty settling the Newfoundland fisheries dispute. From Boston comes a statement that an agreement has been reached. It embraces, apparently, some sort of *modus vivendi* for the coming season, with a treaty regulating the whole question thereafter. This is good news, if confirmed, and we are glad to read the further report that our Government has somewhat modified its former extreme claims. On no other terms, plainly, could a satisfactory treaty be negotiated, considering the state of feeling on the subject, both in Newfoundland and England. The question still remains, of course, whether Gloucester will permit the United States to ratify such a treaty.

E. H. Harriman voiced his feelings in a remarkable interview telegraphed from Nevada last week. The details of it must be accepted with some reserve. Yet it is not uncommon for railway men like Harriman or James J. Hill, who refuse to say a word in New York, to unbosom themselves to some reporter in Reno or Fargo. Possibly, they forget for the moment how infallibly their remarks will be sent broadcast through the country. Also, it is easy to follow up the matter with a denial, or to say to the enterprising Western reporter, "Thou hast mis-spoken, misheard, tell o'er thy tale again." Certainly, some of the statements attributed to Mr. Harriman are scarcely in keeping with his character, or that of any sensible man. If he really said that he would not further decline to answer the questions put to him by the Interstate Commerce Commission regarding his personal speculation in the securities of the railroads whose finances he was manipulating, some highly interesting revelations should follow. His present explanation is much confused. He had refused to answer because he could not "in justice to his associates." But now he will, his

associates being left, apparently, to look after their own justice. All this is pretty mysterious. But we know that the sure result will be to depress stocks further—or else to set them booming. The wise men of Wall Street will tell us which, after the market closes.

The legal action begun by the Buck's Stove and Range Company against the American Federation of Labor and its officers concerns no petty or local grievance, but a cardinal policy of the trades unions as they exist in this country. If the Supreme Court of the District of Columbia, where the Federation maintains its headquarters, grants the permanent injunction sought against Mr. Gompers and his associates, it must be on grounds that substantially outlaw the boycott in its present form as a means of industrial warfare. The particular grievance which led to the strike of a year ago in the St. Louis works of the complaining corporation is not the chief point at issue. The "We don't patronize" list printed in every issue of the *American Federationist* is prefaced by the statement that before any firm's name is placed thereon the Federation "uses every endeavor to secure an amicable adjustment of the matter in controversy, either through correspondence or by having a duly authorized representative of the American Federation of Labor interview such firm for that purpose," thus giving the impression that the boycott is an extreme measure held in reserve after all others fail. As a matter of fact, it is declared in the company's sworn statement that the Federation "had never sought an interview with the plaintiff, either through correspondence or by any authorized representative or in any other way, for the purpose of ascertaining the plaintiff's version of any matter in controversy . . . or brought it to the attention of the plaintiff that said union had, or claimed to have, any grievance with the plaintiff; nor did it make any effort whatever to adjust the matter with the plaintiff . . ." The account of the methods by which the boycott thus begun was prosecuted reveals their identity with the tactics of our most obnoxious Trusts. Never did the Oil Trust or the Beef Trust or the Tobacco Trust deal more remorselessly with the dealer who handled other than their own products. No question of physical violence is raised in the action, but the court is asked to enjoin the Federation and its officers from prosecuting its "conspiracy" in restraint of the stove company's business. It will doubtless be promptly submitted on the labor side that the methods complained of are those regularly employed by the corporations against their competitors. So they are, no better and no worse.

The withdrawal of the American Tobacco Company from Texas because of the fearful risk it and its employees ran when doing business in that State, raises the question how far the people of Texas really have the courage of their anti-Trust convictions. For in the long run the boycott and outlawry of the Trusts will have as many social and personal consequences as faithful adherence to any of the creeds. The logical Trust-buster must, like the Dowieite, abstain from tobacco, like the theosophist from meat, like the Mohammedan from whiskey, and from a hundred other commodities that even the straitest sects do not forbid their votaries. It is just as hard in our society to live a life absolutely free from Trust products as to live one absolutely germless or entirely free from any other sort of taint. The safe way is to withdraw from the world. A colony of Trust-busters producing its own food, clothing, and all other necessaries would fulfil the requirements well enough. At least, if there is logic in the world, the arts and crafts and village-industry movements ought soon to feel the stimulus of the campaign against the Trusts.

Revelations of corruption having been so appalling as they were in San Francisco, and the time to forget them so short, any other outcome than a reform victory in the first primaries was hardly to be expected. In those both of the Democratic and Republican parties, delegates favorable to the continued support of the prosecutions of bribers and grafters were chosen. The opposition to this programme within the Republican party elected only 19 out of 149 members of the next nominating convention, while the dominant faction of the Democrats is said to favor the endorsement of the prosecutor, District Attorney Langdon. There seems to be a fair chance of fusion of the two parties on essentials. The third convention, that of the Union Labor party, however, will be so completely in the control of opponents of the pending prosecutions, that even the renomination of Schmitz is within the range of possibility. This would be going beyond the precedent of that Massachusetts constituency which lately nominated and elected to the Great and General Court a representative actually in jail at the time. Happily, whatever may be decided about the nomination, the election of the convicted Mayor is, in the present state of feeling, inconceivable. But if San Francisco ever finishes with its big criminals and has leisure to look after minor offenders, something may be done about the pernicious political activity of Postmaster Fiske, who led the lost cause against the Reform League in the Republican primaries. Does the Presidential order against that sort of thing not run west of the Rockies?

The war between the chauffeur and the police has become so active, and is now conducted on such scientific principles, that text-books of strategy will soon be needed. The old plan of hiding on the roadside, stop-watch in hand, has been abandoned by the up-to-date constable. Traps of different sorts are now set to catch the unwary, the most effective being the "measured distance." As a defensive scheme, the Automobile Club of America sends its representatives to inspect the districts where speeding is likely to end in arrest, and at important points flagmen are stationed to warn the innocent tourists. Complaints are made that many of the officers bear what are really letters of marque, to replenish local treasuries, and that the automobile owner is unjustly made a victim of this unauthorized tax-gathering. But in the long run, chauffeurs have as fair treatment at the hands of the police as they deserve.

As a long step towards woman's emancipation, coöperative housekeeping, a panacea much urged of late, has its inevitable drawbacks. In the very matter of coping with an insufficient supply of domestic help, the system, if extended widely enough, would prove a failure; for it is obvious that while economies in household labor can be effected to a certain degree under more or less communal living, the demand for domestic labor must enormously increase when half of those who now cook and dust for husbands and fathers shall exchange the pot and the broom for the trowel, the yardstick, and the pen. If we conceive the entire population of this country organized into communal units, and assign one servant—whether cook, chambermaid, nurse, or furnace-tender—to every ten persons, certainly not a high estimate in view of the fact that first-rate hotels find it necessary to employ an equal number of servants with guests, we shall have a demand for something like 8,000,000 domestic laborers instead of the 1,500,000 that are now to be had. Where is this vast supply of labor to come from? Even if under new conditions men may come in time to share equally with women in household work, for many years the work must continue to be performed by women. And, naturally, those whom generations of training have given superior initial facility in the art will constitute the bulk of domestic workers in our new phalansteries. That is, women, who now cook and work in their own homes and in their capacity as mothers and wives, will then cook and work in centrally located kitchen laboratories in the capacity of hired labor. Specialization, therefore, has its dark side as well

as its bright; if many women who are now unresigned cooks will be specialized into inventors and poets, many other women who are now mistresses of their own homes will be specialized into just domestic "help." Were the dream ever to come true, the result would be much like that of the Industrial Revolution and the birth of the factory system all over again—not an unmixed blessing.

There are European observers who believe that Finland's lately recovered liberties are once more in danger. It has been announced that Gerhardt, the liberal governor-general of the grand-duchy, is soon to be replaced by Gen. Beckman, who has gained an evil reputation by his ruthless policy of repression in Courland. It is surprising, however, to find a tendency in foreign papers to blame the people of Finland for any new assault that may come out of St. Petersburg. Under the Bobrikoff régime, it is argued, Finland acted admirably. To tyranny of the most exasperating kind she opposed a splendid endurance that was unconquerable just because it was passive. Now that the Finnish Diet has been democratized and the Socialists have come to play such an important part in the reformed Diet, Finnish aid has gone out towards the revolutionary parties in Russia proper, and the just resentment of the Czar has been awakened. This is a curiously distorted view of the relations between Finland and Russia. The grand-duchy might have gone on passively waiting—or whistling—for lost liberties, if the great Russian upheaval of October, 1905, had not brought, along with a "Constitution for Russia," a restoration of the old régime for Finland. As a matter of fact, the Russian revolutionary parties were justified in reproaching Finland's selfish concern for her own interests, once her freedom was regained. If Finland now coöperates with the reform movement in Russia, she is but repaying a just debt, and if bitter consequences come, it is not the Finns, but the autocracy, that should bear the blame.

The eighth Zionist Congress, now in session at The Hague, meets under auspices more favorable than those that presided over its immediate predecessors. Its brighter prospects arise from the setback which the Liberal movement, and with it the cause of the Jews, has lately encountered in Russia. Primarily, it was the condition of the Russian Jews that gave birth to Zionism, and it must continue to be the fortunes of the Jews in Russia that will shape its future. Experience has shown that, whenever Liberal hopes dawn on the Jewish subjects of the Czar, the nationalistic spirit among them weakens, when the inevitable disenchantment comes there is a rebound towards Messianic aspirations. About the year 1880, leading Jewish thought in Russia was largely for assimilation and national disappearance. The massacres of 1881 came as a rude awakening and created a strong current in the opposite direction. Again, in the opening years of the present century, whatever activity there was among the Jews was largely revolutionary and non-sectarian. It needed Kishenev to produce a second recoil towards Separatism. The influence of Kishenev still survived in the revolutionary upheavals that began in 1905; Zionist societies carried on the reform propaganda side by side with the Socialist organizations; nevertheless, it is a fact that the mass of Jewish youth began to forget and let itself be carried away by the argument that there was little use in working for Zionism in the face of a much speedier solution of the Jewish problem that would be brought about by the overthrow of the autocracy. In working for the liberation of the Russian people, we work for the liberation of the Jews, was the revolutionist motto. The postponement of that larger hope must once more create a reaction in favor of the strictly national movement.

From the outline programme of the International Socialist Congress which assembled Sunday at Stuttgart, it is not difficult to gather that strong forces are at work within the Socialist movement in a direction that may be called almost conservatve, though the Socialists themselves prefer to use the terms "revisionist" or "opportunistic." The undefiled Marxian teaching, as expounded at the present day by such orthodox commentators as Karl Katusky, is rooted in the essential idea of class struggle, and has for two of its most striking tenets the solidarity of the workingmen of all nations, and opposition to militarism, which is regarded as one of the great defences of the capitalistic system. It is not without significance, therefore, that the British Labor party is planning to ask "for the admission to the International Congress of those trade unions which, though bona fide, are not expressly based on class war." It is true that the Congress, acting on the recommendation of its permanent international bureau, will probably declare against such a plain abandonment of a cardinal doctrine of the party, but it is significant that the proposition should have been brought forward. Again, on the question of emigration and immigration, the American, Australian, and Dutch delegates are to submit a resolution pledging the party to oppose the importation of Chinese or negro labor into countries where it would compete with the white workingman; the broader subject, even, of the expediency of opposing the importation of foreign laborers for "sweating" purposes, is to be taken up by the Congress. Anti-militarism is to be discussed; but the question will have to be treated in the light of recent declarations made by Bebel in Germany and Jaurès and Guesde in France, of their readiness to take up arms in defence of the fatherland, just like the ordinary good bourgeois.

Bavarian Catholics are rejoicing over the adjustment of the differences between the Pope and the committee engaged in erecting a monument to the heretical Professor Schell. Although the Vatican at first disapproved of paying respect to the memory of one whose book was on the Index, a *modus vivendi* was reached. The committee explained that they had no desire to protest against the decision of the Holy See, but "intended only to honor an illustrious son of the Church." The Pope then intimated that he would be satisfied if they made a distinction between the man and the theologian. This would have pleased Pascal's Monsieur Distinguo. The tension, however, between Rome and the German Centre has now been relieved, especially since a Frankfort review has printed a letter from the late Professor Schell, in which he said: "I submit myself herewith to the decree of the Roman Congregation of the Index, . . . with the obedience and respect which are due to it." Yet in its efforts to suppress free inquiry, Rome may well recall what a great Cardinal said of the increase in the Liberal Catholic minority: "Now it is scarcely a party; it is the educated lay world."

Ernest Daudet urges in the Paris *Figaro* a new philanthropic undertaking for the relief of those who are recovering from insanity, or who have been cured of it. According to statistics, in the Department of the Seine alone there is an annual discharge of patients from insane asylums of 2,400. Both M. Daudet and the Princess Lubomirska are taking an interest in these rather helpless people. As a rule, when they come back into the world, they are ill-fitted to make their way. They have lost confidence in themselves, they are timid with others, and are painfully aware of the feeling towards those who have been even temporarily insane. Thus they are likely to fall into intemperance, and even crime. The plan proposed is to construct special workshops for this class of patients, where they can make a living while enjoying freedom. One such place was opened in Paris five years ago. The importance of caring for such unfortunates will be appreciated by any one who has observed the effect of an asylum on the feelings and will of patients, however carefully treated.

PEACE BY PAINFUL INCHES.

In De Quincy's essay on "War," he announced his intention to leave a half-crown by will to be kept at compound interest until war should have been abolished. By that time, he was confident, a fund would have accumulated "overshadowing the earth," large enough to retire all soldiers on full pay, and to meet every other expense incident to entire disarmament. This gibe at peace associations, it might almost seem, the Hague Conference has done much to echo. Its proceedings have been dilatory beyond all expectation; on many important questions the delegates have been hopelessly deadlocked; several projects have been given polite burial by means of a stubborn minority vote; while the agreements reached have often been so attenuated by the time everybody was brought round to assent to them, that they seem almost meaningless.

Of this character was the resolution adopted on Saturday touching the limitation of armaments. This is the subject which was put into the forefront of the first Conference at The Hague. It was, indeed, the chief purpose of that body's being summoned at all. It won for the Czar the title—too fleeting—of the "Disarmer." Yet nothing but a sentiment was expressed by that Congress. It was decided that the time was "not ripe," that the subject was not sufficiently "mature." All the greater, then, the hopes that, eight years later, something really practical might be devised. These hopes were all the brighter for the attitude of the Liberal Ministry in England. Sir Henry Campbell-Bannerman is a stout friend of peace, and his public utterances, as well as the bill of his Government providing for a restricted programme of naval construction in case the Hague Congress should do something for disarmament, were an earnest of his good faith. Germany's blunt refusal, as announced by Chancellor von Bülow, even to debate at The Hague any plan of disarming, was undeniably a severe blow, yet President Roosevelt nevertheless instructed our delegates to press the matter. This was most commendable in him, and the persistence of Mr. Choate and Gen. Porter roused fresh expectations. They were all, however, doomed to disappointment. In order to secure harmonious action, a resolution was adopted which one scarcely knows whether to call a pious hope or a pious fraud. The Conference merely reaffirmed the empty wish of that of 1899, and declared that, whereas, instead of diminishing, military burdens had been piled higher since that year, "it is highly desirable to see the governments earnestly resume the study of this question."

How the said governments are going to do it more successfully than in general conference at The Hague, does not appear. Germany has dogmatically stated that no "formula" for limiting armaments and reducing the load of taxation for military purposes, can be found. If the assembled governments cannot persuade her to the contrary, how can an individual government, by separate negotiation? At The Hague there were delegates especially competent to deal with this matter, and distracted by no other business in hand. If they could arrive at nothing but a vain form of words, it is not likely that the further "study," of which the resolution of the Conference makes mention, will lead to anything definite. So we are compelled to set down the final action of the Conference respecting disarmament as one of the great disappointments which it has given the world.

We do not, however, regard the time and debate bestowed upon the matter as wasted. To confer seriously about a great peace measure, even if it be not secured in any tangible and effective form, is to do something, after all, to breed the temper of peace. War ministers cannot hereafter, without an apology, introduce swollen military budgets. Henceforth they will be on the defensive. Those who propose such expenditures will have to cast about for new arguments to justify them to the pockets as well as to the consciences of the taxpayers. The latter will be tempted to say: "You affirm that we must pay larger sums for battleships and artillery because other nations are doing it. Yes, but why didn't you take steps, when you had a good chance, to agree with other nations not to impose these burdens upon us?" The Hague Conference has not done anything positive to disarm the various military countries, but it has at least done something to disarm their rulers of the old weapons used in the mad competition in armaments.

The work of the Congress at The Hague will soon be over. Before it adjourns, it is regarded as certain that provision will be made for an international prize court and a permanent international tribunal of arbitration. The two may be combined. This will doubtless be the greatest and most beneficent memorial of its existence which the Conference will leave behind it. It is too early to appraise its entire achievement. That it has failed to meet the high hopes of lovers of peace throughout the world, is indisputable. Nobody is better aware of this than the delegates themselves. Yet their meeting and discussions and decisions have been, when all is said, one of the means by which civilization gains now and then a painful inch against barbarism—and even De Quincy admitted that war is a relic of barbarism.

EUROPE FEELING AMIABLE.

The recent meeting between King Edward and the German Emperor is as much a sign of growing good feeling among the Powers as an event contributing to the encouragement and maintenance of such a delectable state of affairs. The Continental press has been comparatively free, for some time, from charges and counter-charges of sinister designs harbored by perfidious nations against their peace-loving neighbors. Months have passed without untoward events, compromising incidents, or governmental indiscretions. There is even less talk in Germany of tremendous fleets against Britain and *Weltherrschaft*, or in England of Germany's designs in Africa and the East. Von Bülow has been graciously frank with a French journalist, and, through him, with the French nation. Tittoni has assured Austria-Hungary of Italy's loyal attitude in the Balkans. There has been a veritably dazzling succession of royal interviews accompanied by exchanges of international felicitations, and though such formalities are always liberally discounted, they cannot but produce a favorable impression if repeated with sufficient frequency.

Quite possibly, the sessions of the Peace Conference at the Hague have helped to impart a softer tone to international relations. The ruling classes on the Continent, more even than the world at large, have refused to take the Conference seriously. But their very argument that peace among the nations cannot be established by the delegates at the Hague, and that it must be left to every state to labor for peace by pursuing its legitimate interests without detriment to others, must have acted as a check upon the professional patriots and war advocates, if only through regard for public opinion. It is conceivable that men should believe that a dozen battleships are a stronger guarantee of peace than four times that many diplomats in plenary session; but no politician can go on indefinitely crying for peace-creating warships at any price, and at the same time baiting the nation across the water, without being found out by his own fellow-citizens. Thus it is possible that, once the Hague Conference dissolves, the Jingo English and German press will get to work again; but it is enough that for the time being it is agreeably mute.

For just a decade it was the Far East that was the cause of most European heartburnings. China was, indeed, a stake worth playing for and quarrelling over, and it was with an eye to possible "world-dominion" in China that Germany earnestly set to work to build up a mighty fleet. Hence the vehement thunderings in the *National Review* and the London *Times*, and rumbling rejoinders in the *Kölnische Zeitung*, and

in Imperial speeches. Once the game was set going, it was easy enough to find food for animosity. Then came the Boer war to keep feelings red-hot for four or five years, till the Far East once more claimed the world's attention. The Russo-Japanese war marked the beginning of another chaotic period of fevered international strain, which is just now relaxing. The ill-feeling aroused in part by that struggle persisted for some time after the outcome of the war had been decided, manifesting itself, for instance, in the Morocco crisis of 1905-06. Now that England and Germany are somewhat more cordial, it is found that Morocco offers no cause for misunderstanding. In other words, Japan's triumph, and the removal of China from the field of European political ambitions, have removed the most potent cause of war in Europe.

Ostensibly, the great danger to the peace of Europe during the last three years has been the resentment aroused in Germany by Great Britain's entrance into a series of alliances and "understandings" which the Kaiser's subjects have taken as aimed directly against themselves. England's treaty with Japan in 1902 was followed by an important agreement with France in April, 1904. This has been accepted as having the value of an actual alliance without the name. Russia, though soon to be humiliated and weakened in the Far East, was still France's formal ally, and Germany found herself, as she thought, threatened by the possibility of a general European coalition. When Spain and Italy, the latter in spite of her adherence to the Triple Alliance, entered into increasingly amicable relations with France, and therefore with Great Britain, the hostile circle of alliances became almost a verity to German eyes. "Do not isolate us, or we will fight," was the burden of the Emperor's speeches till about the beginning of the present year. A coalition of Powers under England's formidable leadership, the Triple Alliance giving way, was there not enough cause for alarm? And then came the climax of Great Britain's insidious policy—a contemplated alliance with Russia.

Logically, the conclusion of an Anglo-Russian agreement should be the signal for a German declaration of war, but—common sense asserts itself in critical moments. What hostile design can there be in a system of alliances that includes—everybody? An understanding between England and France may very reasonably be regarded as fraught with danger to Germany. Add Spain to the combination, and the danger, reduced in one way, perhaps, by the introduction of a new partner with interests and ambitions of her own, is still there. But add Italy, the ally of Germany; add Russia, who, as has been shown repeatedly, still counts strongly on German friendship—and your hostile circle of "alliances" assumes the true aspect of a series of treaties binding the contracting parties to ways of peace in their ordinary relations, but pledging all of them in no sense to actual coöperation in war. Germany's "isolation" is shown to be, what it has been all these years, largely a myth.

So the nations seem to have grown a trifle ashamed of their bitter paper warfare and to have made up their minds to leave foreign politics alone for a while. Surely, the governments have enough matter to keep them busy at home for some time. Social questions, in varying form, are calling for attention all over Europe. To say nothing of Russia's difficulties, Austria has her new system of universal suffrage to get accustomed to. Germany is now giving particular thought to the Poles and the Prussian suffrage. Italy is absorbed by the anti-Catholic movement. France has not yet disposed of the same problem. In every country the Socialists are now well to the fore, and there can be little doubt that their influence of late has been a powerful force for peace.

FINANCIAL MYTHS IN THE MAKING

"We love to delude ourselves," said Goldsmith, and if he could hear the various explanations of our financial troubles, given to-day, he would be strengthened in that opinion. The most positive assertions are made about their cause, and pass current among men of intelligence. But all of them cannot be true, for they contradict each other. It is highly probable that no one of them contains more than a part of the truth. Yet they are sedulously put about, delusive though most of them must be, and are forming the basis for future snap judgments upon this period. In other words, they are contributing to financial myths which we contemporaries have the advantage, if we are able to detach ourselves, of seeing in the making.

They are all characterized by the two qualities which popular explanations of intricate matters nearly always have. They reduce everything to a single cause. They identify that cause with a personality. Of this we have had many examples, even in our recent past. About the panic of 1893, a myth grew up which has now become as gospel truth in the minds of millions. There was the one cause—the tariff. True, the tariff was not touched in 1893, but that made no difference. Low tariffs are well known to be as destructive before they exist as after. Hence it is an article of faith with most good Republicans that the tariff of 1894 was the sole cause of the financial upheaval of 1893. And there was also the personality requisite—that of Grover Cleveland. It was his panic, for was he not President, and was he not for revising the tariff? The force of demonstration could no further go; and "the Cleveland panic," myth though it was, has passed into that most sober and authoritative repository of history, the Republican campaign textbook!

The myth-makers have been abroad for several weeks. You meet them at every street-corner and in every car, wagging solemn heads and telling all comers exactly what is the cause of the troubles in Wall Street. One man will demonstrate to you that it was the Standard Oil fine. Another will prove to a nicety that it was the corporation-baiting of the Government. The tariff, so far as we know, has not been brought in, but why should it not be? Taft, the favorite candidate of Roosevelt for the Presidency, has declared himself for cutting down protective duties; and why should not that gun kick before it is fired, as disastrously now as in 1893? A reasoner of the strict Republican order of logic could make out a good case for the contention that Senator Lodge's recent announcement that the tariff would be revised in 1909, was the *vera causa* of the fall of stocks. There is no lack, naturally, of personalities to go with the mythical causes. It is the Southern Governors; it is Hughes; it is the Public Service Commissioners; it is Bonaparte; it is a country looking at Roosevelt, and saying, Hamlet-fashion, "Something too much of this." He must be hard to suit in the way of mythical causes, and persons without real responsibility, who cannot make his choice among so many.

Against the short and easy method of the myth-makers, it may seem ungracious to place the attitude of sober inquirers into the actual phenomena. They are neither so cocksure nor so sweeping. They are foolish enough to distrust the glib gentleman who comes forward with a skeleton key warranted to fit the most complicated lock. Yet there is something to be said for their position. In the presence of a vast world-movement in finance, interrelated in its manifestations and consequences in all markets, it is too severe a tax upon credulity to pitch upon the opinion of a judge in Illinois, or even the policy of a President at Washington, as the single and sufficient cause of all. Immensely varied and complicated effects cannot be accounted for off-hand in that way. If we are to dread the man of one book, we surely are to distrust the man of one explanation for everything. By dint of repeating it, and even shouting it, he may advance it to a place among popular myths; but he will never be able to satisfy with it either the sifting historian or the analytic student of finance.

We are not going to offer any little myth of our own. The phenomena in the financial world, now under study, are too extensive, too subtle in their in-

terplay, for any man to be sure of all their bearings. But certain things in the nature of results may be pointed out, even if we must remain more or less in the dark, for a time, in respect to their true causation. The prolonged liquidation which we have been witnessing has all the air of an inevitable movement, something too large and involved to be attributed to a single cause or to any one man, and also seems, all things considered, a wholesome movement. The common remark, "Money is being forced out of Wall Street to be put at the disposal of business men," expresses, in a homely way, one consoling and even encouraging aspect of the situation. The process of providing funds for the great business of the country may have proved very hard upon top-heavy speculation, but it is difficult to see how the thing could have been done in any other way.

DEMOCRACY AND LOVE.

We observe with pain that recent fiction withdraws from the humble all hope of marrying into "society." There was a time when King Cophetua wooed a beggar maid, and when the Marquis of Saluzzo married Patient Grissel, the peasant's daughter. In those days a knight riding abroad in the April sunshine did not disdain to make love to a pretty *pastoreta* as she tended her sheep; did not scruple to beat a masterly retreat before a big stick in the hands of the *pastoreta's* young man; indeed, did not even object to chronicling the incident himself. There, if you will, was social equality—and when did all this occur? Why, in the Middle Ages, before our boasted democracy was heard of. In more recent times, governesses married earls, and milliners marquises—and where but in monarchical England? Even now, we understand, the works of Miss Libbey keep alive on the soil of our own Republic the good old tradition of the lordly lover and the lowly bride. But, generally speaking, we have changed all that. The writers of our short and of our "continued" stories, nay, of our dollar-and-a-half novels (reduced to a dollar-eight), now insist that He and She shall be social equals.

He is poor, but belongs to the first families. To support his winter studies at the law school, he tends a lighthouse during the summer. Her, a storm one night blows in at the lighthouse door. Is she a fisherman's daughter? Is she a sailor's child? Ah, no; she is a sophomore at Smith, and with admirable presence of mind quotes Spenser as soon as she regains consciousness, lest the reader remain for a moment in doubt as to her quality. Or, again, He happens to be waiting at a corner in his car—a six-cylinder car: obviously he is an aristocrat. She, passing by chance, takes him for a mercenary chauffeur—how careless of the Williamsons, by the way, not to have copyrighted this *motif!*—and hires him to drive her home. Is she a garment-worker? Is she a chorus-girl? Not in the least. At a house party—that *milieu* of all that is most exclusive—he meets her as a fellow-guest, and declares his love to the accompaniment of explosions by the six-cylinders, while the car goes to glory. Over the whole adventure floats an exquisite savor of "classiness" and *pétrol.*

Now he is a young professor, and she is a rural maid in the land of Pennsylvania Dutch. Having duly fallen in love, they must somehow or other be socially equalized. Here we pause for a moment to disclaim any intention of dealing with the question, What *is* the social position of a professor, anyway—a man who cannot even call a two-cylinder runabout his own, and who never in his life shook hands with a monkey, except possibly in the interests of linguistic science; a person, in short, totally without advantages? Well, the rural maid proves to be no rural maid at all, but "the kidnapped child of very wealthy and refined parents"—like many a pastoral heroine, from Longus to Allan Ramsay.

Finally, the ingenious creator of what may be called our coal-tar series of sweethearts—Iodyl, Amidol, Rosinduline, and all their sisterhood—has now given us a new set of organic by-products, as if for the very purpose of supporting our thesis. A person with a monocle, but otherwise harmless, succeeds, by means of casual absent treatment, in wholly transforming the characters of several fellow-members of his club. At the same time, again quite at random, he performs the same operation upon an equal number of young women—selected only for their good looks—who happen to pass the club-window. Thus a cockney cit becomes a lover of nature; a "cold proposition" develops gayety, sympathy, and a love of adventure; and a snob grows actually feverish with the passion for social equality, and wants to marry his cook.

The nature-fiend and his affinity meet for the first time in Bronx Park, run a race, and climb a tree together in pursuit of the same butterfly, discover and communicate their love, and find—here's the point—that it is perfectly proper for them to wed, because they have common acquaintances. As for the devotee of adventure, he finds his destined bride in a poor quarter of the city; but she is a settlement worker, belongs to his set, and knew his sister at school. The case of the radical is, of course, exactly in point, and so most significant of all. He is saved from his cook through the intervention of a dear girl picked up by chance on the Avenue, who consents to disguise herself as a parlor maid in order to receive the hero's affections, which, of course, are ready to attach themselves indifferently to anybody of a lower social level. But, alas! all is in vain; she, too, is "in society." Hardly has she heard his name when she exclaims: "Not *Kelly* Jones!"—and, needless to say, the clergyman is telephoned for at once. Fancy, though, her post-marital confession: "Kelly, dearest, I have deceived you. I am not what I seem. My father is Wilhelmus Van Sinderen, and I am one of New York's best-known belles. My picture is in all the Sunday papers, and there is no woman so ignorant as not to know all that I wear." Yet, what will not love forgive?

We conclude with a word of admonition to our popular novelists. If they insist upon closing a career that has been ever open to talent, equality must find her champions elsewhere. Already we discern signs of vague unrest among the writers of doctoral dissertations. Somehow, counting the vowels in Browning and the dative singulars in Diodorus Siculus no longer seems to satisfy them. Soon they will turn—in fact, they have begun to turn—their minds to the settlement of our burning social questions. We look to receive any day a dissertation on "Democracy and Love," bristling with examples from Mrs. Martin, Mr. Chambers, and the rest. How will they like that?

THE EXCHANGE OF COLLEGE STUDENTS.

The exchange of university professors between countries and between different institutions at home has been lately a frequent topic of discussion. Less has been said, however, of the other process by which somewhat the same result was all the time being secured—the annual interchange of students between different institutions and especially between different sections. Of course, the mountain of alien students can never be made to come all at once to the feet of any professorial Mahomet, but the individual units which do come presumably gain in breadth quite as much as if the professor had made the journey to them.

For *Science*, Prof. Rudolf Tombo, jr., has prepared an interesting table showing the geographical distribution of the students at a group of leading universities and colleges, and his figures reveal an educational commerce of this sort more extensive in amount than we believe most educators have fully realized. The older Eastern institutions have, of course, always drawn large numbers from the West, and for obvious reasons. But there has grown up more recently something of a counter-movement. Students from Eastern States appear in increasing numbers in the catalogues of the better Middle Western universities, but—and here is one of Professor Tombo's most interesting points—with-

out apparently reducing the Western representation in Eastern institutions. As compared with similar statistics for last year, the group of Eastern universities, including Columbia, Cornell, Harvard, Pennsylvania, Princeton, and Yale, is seen to have gained in the representation from every section of the country, *especially* the North Central. There is thus less evidence than had been supposed to support the common view that the building up both in size and standing of the great schools of the Middle West would induce Middle Western parents to give up the practice of sending their sons East to be educated. On the other hand, the relatively smaller number of Eastern students in the West has increased. Harvard has 522 students from the North Central division, Michigan 505 from the North Atlantic States.

Without attempting to summarize here all the information contained in the table under consideration, it may be stated that there were last year in the seventeen colleges and universities included no less than one hundred and forty-five "delegations" of students whose homes were outside the States where they matriculated. Of "delegations" of ten students from other States, large enough to form a respectable club, there were 273. Not counting Massachusetts, twenty-one States were represented in Harvard by twenty or more students each. Yale and Columbia had each seventeen such groups from outside their own States; Cornell sixteen, Michigan fourteen, Pennsylvania and Wisconsin nine each, Princeton and Illinois seven each. New York State sends twenty or more students to each institution in the list, except the Universities of Virginia (13), California (5), and Illinois (14).

A second table prepared by Professor Tombo shows the representation of students from foreign countries in American colleges and universities. The total number of such students, which last year was 792, has this year risen to 897, although there are fewer students from Europe, Africa, and Australasia. Without the equivalent of Rhodes scholarships we drew fifty students from England in nine institutions, and thirty from Germany in eight. In twenty-three instances ten students from the same foreign country are found studying at the same American college or university. Thus Pennsylvania has New Zealanders, Australians, Japanese, Central Americans, and Canadians; Cornell, Canadians, Cubans, Argentines, and Chinese; Harvard, Canadians, English, Chinese, and Japanese; Michigan, Canadians; Yale, Canadians, Central Americans, Chinese, and Japanese; Lehigh, Cubans; Ohio, Argentines; Columbia, Canadians and Japanese; and California, Chinese.

Undoubtedly, a large proportion of the attendance which a college draws from abroad or from distant portions of this country is due to the reputation of some particular department or professor. "Except ———, there is no good place for my sociological studyings of economics," wrote a Japanese student in the days when his countrymen were still curiosities in American seminar rooms. Practically two-thirds of the Australian and New Zealand students in this country are studying dentistry at the University of Pennsylvania. But this evidently fails to account for the extent of the shifting which these figures reveal among our States. The equalizing of educational advantages in different sections, instead of keeping students near home, appears to have rather increased migration. The sending of sons to the colleges from which their fathers were graduated is doubtless an important and continuing cause of this.

PARIS LITERARY GLEANINGS.

PARIS, August 5.

The book, "Dogme et critique," by Edmond Leroy, is of passsing interest, because of the effect it is producing. It is not a work of higher criticism, like the books of Abbé Loisy, but rather a philosophical study in the evolution of religious doctrine; and even this should, perhaps, be limited to the evolution of the explanation of the contents of doctrine. M. Leroy has protested, almost pathetically, his absolute loyalty to the formulas and definitions of Catholic dogma. He is obviously not striving to insert a quite new doctrine under the old name. He has not, however, in these troublous times of religious intellects, escaped the condemnation of the official teachers of the Church; and the aged Cardinal Richard, while bearing witness to the religious earnestness of the author, forbade the faithful of his diocese to read the book. Other bishops have followed his lead, and the book came up again in this week's meeting of the bishops of the north of France in Paris. Several of the bishops expressed the obvious desideratum that the book should be refuted, if it is to be condemned finally; and all seem to recognize its philosophic value where not at variance with traditional teaching. As an indication of religious change toward what is now called "Modernism" no great importance should be attached to such books; as in the case of Abbé Loisy, there are not 1,000 practising Catholic laymen in all France who ever hear of either controversy or books, and fewer still of the clergy who ever take them into consideration. This lack of practical efficiency in religious controversy does not lessen the value of the philosophical *lumina* reflected from the book.

A purely technical work, but of great use to all making a documentary study at first hand of French history, is "Les Sources de l'histoire de France depuis 1789 aux Archives Nationales," by Charles Schmidt, with a preface by Prof. A. Aulard, whose specialty is precisely the handling of French Revolutionary documents. The book is a practical guide to work in the Archives Nationales, from the permissions to be asked for making research, and the description of the work hall, to a complete indication of the "sources" of history for a department, arrondissement, canton, or commune, as contained in the Archives, with the departmental series. In such local documents, where history is caught in the very act, Taine did his most striking work.

Frédéric Masson of the French Academy uses his unrivalled collection of old papers of Napoleon's times to spring new and side surprises on his public, without stopping the flow of his Napoleonic volumes properly so called. "L'Affaire Maubreuil" concerns one of those interminable judicial failures, mixed up with obscure politics, in which French history is fertile under all régimes. Maubreuil, of noble family, seems to have been used in Napoleon's secret service. When the break-up came, he tried on his own account to get possession of the rich jewels of Catherine of Wurtemburg, wife of Jérôme Bonaparte. She appealed to her cousin the Czar, who began proceedings, which M. Masson narrates with passion, although he has not been able to unravel their secret. Maubreuil lived until 1869, pensioned for no apparent reason by both Louis Philippe and Napoleon the Third.

Jules Huret begins the publication in book form of his long investigation of Germany as it is, which he originally communicated to the Paris *Figaro*. This first volume completes the Rhine and Westphalian country. Americans, not caring what foreigners say about themselves, may not have paid much attention to M. Huret's two volumes on the United States. But the rapid, steady, and immense industrial development of the German Empire should make welcome this account by a trained and intelligent observer of German prosperity, cities and ports, heads of factories and philanthropists, great employers' unions, workmen and artists, discipline and morals, and, last, not least, the students of the Empire. The book is written with French lightness of touch, but great good will and serious application are shown on every page. Never were statistics dished up more entertainingly. That German authorities may find defects is more than likely, although the criticism of the periodical publication was kindly. For outsiders, the reading of the book is an easy way of being impressed with the new and true greatness of Germany—a country which, in thirty years, has gone far toward overtaking England in industrial supremacy, and shows a development which may dazzle even Americans by its rapidity and extent.

A number of French writers of acknowledged authority in their respective spheres appear as authors of a handy book on the leading questions which agitate Europe internationally—"Les Questions actuelles de politique étrangère en Europe." Francis Charmes of the *Revue des Deux Mondes*, A. Leroy-Beaulieu, R. Millet, A. Ribot, A. Vandal, R. de Caix of the *Débats*, R. Henry, G. Louis-Jaray, R. Pinon of the *Revue de Paris*, and A. Tardieu ("Georges Villiers") of the *Temps* treat successively of English policy, German policy, the question of Austria-Hungary, Macedonia and the Balkans, and the Russian question. There are nine maps.

"Icarie et son fondateur Étienne Cabet" is a book that should interest Americans, whose land of liberty has been used for so many and variegated experiments to remake society. The author, Jules Prudhommeaux, seems to have originally prepared his very complete work as a thesis for the doctorate of letters in the French university. It is a stout volume of more than 700 pages, with twelve photogravures and two maps. He considers it a "contribution to the study of experimental Socialism"; and so it is in the sense of Saint-Simon and Fourier, of Brook Farm, and even of the advanced thinkers of 1848, before the present political Socialism had been invented. This old Socialism was a sort of religion, reforming the world by calling men away from it.

E. Levasseur, administrator of the Collège de France, has gathered into one volume a connected series of statistical papers—"Questions ouvrières et industrielles en France sous la Troisième République." The labor and industrial questions of the French Republic are all the more interesting as France has become an experiment station for Socialism by political legislation.

The literary partnership of the Margueritte brothers is dissolved for the time being. Paul Margueritte lets it be known that he did not care to take part in the work of Naturalism which his brother Victor is publishing under the uninviting title "Prostituée." The book is not a crude bid for notoriety, such as Zola was more than once accused of making. It continues the studies of the brothers in what was once politely styled "the social question," sadly enough to tell the truth. Perhaps the chief objection to the book is that it concerns precisely the residuum, and not the living body of humanity; and that romance is not the appointed method of recovery in such cases.

"Casimir Delavigne intime" is a quite new book made up of letters and family papers by the poet's grand-niece. From the appearance of his first play on the Sicilian Vespers in 1818 to his death in 1843, these papers add really new material to the history of the Romantic movement in French literature, with many pleasant reminiscences of well-known personages, some of whom like Louis Veuillot would scarcely be expected here. S. D.

NEWS FOR BIBLIOPHILES.

The love-letters of Nathaniel Hawthorne, written to Sophia Peabody, are owned by Mr. Bixby of St. Louis, and by his permission they have been privately printed by a Chicago book club, the Society of Dofobs. The work has been done at the DeVinne press—an edition of sixty-two copies, two volumes each. Roswell Field has supplied an Introduction, in which he explains that in editing the letters "there was practically nothing which called for elision" on account of "private and personal references, which might wound the feelings of the living, or seem to speak ill of the dead."

There are one hundred and sixty of the letters, and while many more were undoubtedly written, these are believed to be all that have survived. Ninety-seven were written before marriage, the earliest dated March 6, 1839, and the last June 20, 1842, a few days prior to the wedding, July 9, 1842. After marriage Mr. and Mrs. Hawthorne were seldom separated, and the other letters are scattered over a long period, the latest being dated May 9, 1863. A few of the letters were published in Julian Hawthorne's "Nathaniel Hawthorne and His Wife," but these are in some cases much altered. Portions are omitted, words are changed, sentences are rewritten. The omission of some portions is understandable. The rapture and tenderness of the lover are not for the public eye, but condensation such as the following was certainly unnecessary. On January 1, 1840, Hawthorne wrote:

Very dearest I wish you would make out a list of books that you would like to be in our library; for I intend, whenever the cash and the opportunity occur together, to buy enough to fill up our new book-case; and I want to feel that I am buying them for both of us. *When I next come to Salem, you shall read the list, and we will discuss it, volume by volume. I suppose* the book-case will hold about two hundred volumes; *but you need not calculate upon making such a vast collection all at once. It shall be accomplished* [we will collect it] in small lots; and then we shall prize every volume, and receive a separate pleasure from the acquisition of it.

The words in italics were omitted by Julian Hawthorne; the four words in brackets, "we will collect it," inserted by him.

In many of the letters Hawthorne addresses his betrothed as "Dove," and the ornament (printed in blue) on the title-page of the volumes is a dove carrying a letter in its beak. In one of the earliest letters, dated July 3, 1839, he wrote:

I believe that "Dove" is the true word after all; and it never can be used amiss, whether in sunniest gaiety or shadiest seriousness. . . . By that name, I think, I shall greet you when we meet in heaven. Other dear ones may call you "daughter," "sister," "Sophia," but when, at your entrance into heaven, or after you have been a little while there, you hear a voice say "Dove!" then you will know that your kindred spirit has been admitted (perhaps for your sake) to the mansions of rest. . . . The name was inspired; it came without our being aware that you were thenceforth to be my Dove, now and through eternity. I do not remember how or when it alighted on you; the first I knew, it was in my heart to call you so.

The first volume contains the letters written during the time that Hawthorne was weigher at the Boston Custom House. The second volume begins with the Brook Farm letters. If the other members of that community had as little liking for work as Hawthorne had, it is small wonder that the experiment was a failure. A few days before he left Brook Farm (which swallowed up his savings, accumulated at the Custom House) he wrote:

I do think that a greater weight will then be removed from me, than when Christian's burthen fell off at the foot of the cross. Even my Custom House experience was not such a thraldom and weariness; my mind and heart were freer. Oh, belovedest, labor is the curse of the world, and nobody can meddle with it, without becoming proportionably brutified. Dost thou think it a praiseworthy matter, that I have spent five golden months in providing food for cows and horses? Dearest, it is not so. Thank God, my soul is not utterly buried under a dung-heap. I shall yet retain it, somewhat defiled, to be sure, but not utterly unsusceptible of purification.

The letters are very tender and characteristic, but they add little to our knowledge of Hawthorne, and it is not to be regretted that they are to remain practically unpublished.

It turns out that the Shelley manuscript verses on both sides of two quarto leaves, which sold at Sotheby, Wilkinson & Hodge's on July 25 for £100, once formed part of Shelley's note-book which is in the Harvard University Library. The two leaves contain the "Stanzas Written in Dejection near Naples," the sonnet "Lift not the Painted Veil," and some new readings. The pages are numbered 72, 73, 74, and 75, and the index of the Harvard volume shows that these poems were on those pages.

In his Shelley Bibliography H. Buxton-Forman notes that the leaf of contents of "Prometheus Unbound," 1820, is almost always a cancel-leaf, and that he was obliged to examine "a great number of copies" before he found one containing the original leaf. Signature A as first printed was of eight leaves, the first a half-title (with advertisement on reverse), the second the title, and the third the contents. In this the heading of the second section is misprinted "Misellaneous Poems." The leaf was reprinted in order to correct the misspelled "Misellaneous." We have seen recently a copy of the book in original boards with this leaf with the misprint, but the leaf is slit at the bottom, as an indication to the binder to cancel it. The new leaf with "Miscellaneous Poems" is also in this copy bound at the end of signature A, after the preface.

It is announced that the great library of Lord Amherst of Hackney will be offered at auction at Sotheby, Wilkinson & Hodge's the coming season, unless meanwhile sold privately. A Hand-List of the collection has been compiled by Seymour de Ricci for private circulation. This forms a large octavo volume of 433 pages, printed on one side of the leaf only. The catalogue is classified, and there is an index. The sale is likely to be one of the most important in recent years. Indeed, there is hardly any sale with which the collection can be compared since that of the first part of Lord Ashburnham's library, June, 1897. The Caxtons, seventeen in number, are the most notable books. Among them are:

"The Recuyell of the Historyes of Troye," Bruges, about 1474. This is the only perfect copy known of the first book printed in English. £1,850 was paid for it at the Earl of Jersey's sale, 1885.

"The Game of Chesse," Bruges, about 1475. One of five perfect copies known, and lacking only the two blank leaves. It cost £645 at Puttick's, December, 1886.

"The Dictes and Sayings of the Philosopbers," 1477. The first book printed in England; lacks the two last leaves and three blank leaves.

Christine de Pisan's "Morale Proverbes." Perfect, and the finest of the three known copies.

Boethius's "De Consolatione Philosophiæ," about 1478. Lacking only the first blank leaf. This copy was bought at Sotheby's July 13, 1887, for £156. Lord Ashburnham's copy with two leaves in manuscript brought £510 in 1897.

"The Mirrour of the World," 1481. The Earl of Jersey's copy, which brought £105 in 1885; perfect.

"Godfrey of Boloyne," 1481. One of only three perfect copies known.

Higden's "Polycronicon," 1482. Lacking eighteen leaves, besides five blanks.

Voragine's "Golden Legend," first edition, 1484. Lacking thirty-three leaves, besides three blanks.

Voragine's "Golden Legend," second edition, 1487.

Christine de Pisan's "Fayttes of Armes,"

1489. Sir William Tite's copy, since made perfect.

Virgil's "Eneydos," 1490. Perfect, except for blank leaves. This copy was the Earl of Jersey's and brought £235 in 1885.

There are also three other books generally described as being from Caxton's press, but later authorities agree that they were more probably printed with his types after his death. These are: "The Chastysing of Goddes Children," 1491; "Tretyse of Love," 1493, and the third edition of the "Golden Legend," 1493.

Besides the Caxtons, there are many volumes from other English as well as the most important Continental presses; and remarkable collections of English Bibles, liturgies, books on the Reformation, on gardening, etc.

Correspondence.

CONSIDERATE REVIEWS.

To the Editor of The Nation:

Sir: The recent comment of the *Nation* upon the "considerateness" of present-day reviewers brought out an undeniable truth, and correctly estimated its bearing upon the retardation of intellectual improvement in several lines. But it is possible to add to what was said in explanation of this undesirable state of affairs. To every one who has done much reviewing the reasons that impel to softness of speech are plain enough. It is not so much for fear of offending publishers and ceasing to get books to review—for a great many reviewers have no direct relations at all with the publishers—as it is for fear of offending colleagues or acquaintances, near or remote, and suffering in one's personal relations. It is easier to talk savagely of a German book than of an English one, and of a volume printed in England than of the treatise of Professor A. whom you are going to meet at least once a year. The closer your actual or potential relations with an author, the more chary you are of speaking your unvarnished opinion of his book or article or poem.

Now such closeness of personal relation, which is conceived to become an asset on more counts than one, is the very object of all those Christmas gatherings of learned societies upon which we felicitate ourselves, and rightly. At these gatherings it is rather exceptional to witness heated altercation; a tone of urbanity characterizes their goings-out and their comings-in. In fact, sodality so far rules that there are not a few who attend avowedly for the sole purpose of making friends, and solace themselves for their sojourn in the corridors with the reflection that, after all, the papers will presently appear in print. Now, back in the "ramping days" there was nothing such as this; the after-type of the erstwhile heart-breaking critic is to-day the free lance off by himself. He has not imbibed the champagne side by side with X, or scrambled for lobster-salad in friendly rivalry with Y. It is not normally among the *habitués* of these gatherings that you find the acrimonious critic. Everyone is familiar with the fact that when you see a man whose opinions you have abhorred, you often find him "not so bad, after all." You become conscious that there are two standards of judgment involved.

The fact is that every one habitually confuses professional and personal relations unless he is strictly on his guard. It is the rare man who can take a tongue-lashing, say in a faculty-meeting, and, after stoutly fighting back, walk home with his castigator in an amicable state of mind. It is too often the case that strong disapproval of a colleague's ideas passes over imperceptibly into suspicion of his motives, and sometimes into a moral judgment. How true this is of political views and opponents, anybody can judge. That it is all wrong, all will admit. In the specific matter of review-criticism few would like to confess that they are wont to confuse honest severity with hostility. It is the ideal to proclaim loudly that one cares only for the truth, welcomes criticism, and the like. This ideal should be lived up to, and critics credited with the same sentiment; the adage about the faithfulness of a friend's wounds should be taken to heart. Petty personal vanity is about all that prevents it.

But there is a further reason for suppressing positive judgments of all kinds in these days. The age is one of doubt, where former ones were distinguished by positiveness, however ill-founded it may have been. People are now afraid of committing themselves too definitely, and judgment is infirm, because it is uncomfortably aware of the fate of most preceding judgments along all lines. This consideration never troubled a mediæval Thomas Aquinas or a Rousseau; it is the product of wider knowledge. Instead of planting the flag in a certain position, digging trenches, and fighting to the last of them—and this process taught the victorious stormers their trade, if it did nothing else—the fashion now is, says the scoffer, to practise mobility, not to say shiftiness and track-doubling, and to be cautious to the last degree about risking all on one position and engagement; the principle is, so to fight as to live to run another day. But this is an extreme view. Certainly we do not wish to return to the days of dogmatism based upon introspection and intuition. We have gained far more than we have lost by realizing the essential changefulness of situations and views, and that the actualities of one time may become, through being recognized as the fictions of ignorance and imagination, the laughing-stock of another. Whatever the superficial form of belief, the underlying predisposition of the age is agnosticism; and this, upon the purely intellectual field, means at least caution in judgment. The only trouble is that over-caution becomes something pretty close to cowardice.

What is needed, then, in order to apply sound destructive criticism—and it need scarcely be pointed out that it is only through the extinction of the less fit that higher types are evolved—is a large-minded divorcement of the personal and the professional, and a disposition unafraid to speak for fear of error. What if there is error? Somebody will correct it; and if his honor is a little greater, what of that? Laborers on the edifice of culture need a greater reverence for the structure and less solicitude as to what others think of their particular bricks and mortar; more love of the work and less of the personal emolument. And this, be it added, applies to critic as well as criticised. Adverse criticism so often awakes resentment, perhaps because the critic is simply trying to "throw down" his "victim." He talks "from above down" and in a tone far from impersonal. He is trying to show off; or at least, he bears the chip on his shoulder. This is an attitude for children. The eye should rather be on the man's work of advancing knowledge through generous co-operation.

Albert G. Keller.

New Haven, August 3.

LONGFELLOW AND THE BRITISH NATIONAL ANTHEM.

To the Editor of The Nation:

Sir: The words of the British National Anthem are from a literary standpoint about as poor as human ingenuity could contrive, and many would be glad to see better literature wedded to the tune of "God Save the King." A correspondent of the Yorkshire *Post* has written:

> A year or so back, holiday-making in the Craven district, I happened to be in Giggleswick, where I found they were keeping the festival of our national saint at church. On the programme of the short organ recital were printed the first and third verses of the National Anthem for recessional, with the following added verse, with a note stating that it was composed by Longfellow on the request of a member of our royal family:
>
> Lord, let war's tempests cease,
> Fold the whole world in peace.
> Under Thy wings.
> Make all the nations one,
> All hearts beneath the sun,
> Till Thou shalt reign alone,
> Great King of Kings.

This is certainly a great improvement on "confound their politics" and the rest of the bathos, but is there any authority for supposing that Longfellow wrote the substitute? I have failed to find it in the Riverside Edition of his writings. If it be there it has eluded my search.

William E. A. Axon.

Southport, England, August 5.

CARRYING PISTOLS.

To the Editor of The Nation:

Sir: The *Nation* of July 25 commends a recent Texas law which imposes a tax of 50 per cent. of gross earnings on all merchants who sell pistols, suggesting this as a proper policy for checking the "concealed weapon" evil. The plan seems to the writer to have decided merit; but I would go farther, and put restrictions at the fountainhead, as it were. The United States Government imposes a heavy tax on the manufacture and sale of all kinds of alcoholic drinks. Now, the manufacture of deadly weapons with which peaceful citizens may slay each other would seem to lack even such pretext for existence or tolerance as may be advanced in favor of the liquor traffic. If all the money and industrial energy that are devoted to this purely harmful business were diverted into useful channels, it is evident that the nation would be a great gainer. It seems entirely logical that the manufacture of weapons for the destruction of human life, in this

boasted age of enlightenment, should be confined wholly to Government agencies, to be used only against foreign enemies or for police purposes at home. Or, if other manufacturers choose to embark in this industry, let it be put in the same category, with even greater emphasis, as the liquor traffic, for revenue purposes.

The law against carrying concealed weapons is at best merely plucking a few leaves from the evil tree, whereas the true remedy lies in attacking the roots of the tree itself. One strong root is the non-enforcement of the criminal laws. If these laws were rigidly enforced in this country as they are in England, there would be no incentive to a continuance of the practice, and, as in England, it would fall into a state of "innocuous desuetude." But our disregard of the criminal laws, and of the sanctity of human life, is a deep-seated social malady, a legacy from the war of forty-odd years ago, which we cannot hope to correct by any sudden or peremptory process.

The total cutting off of the present superabundant supply of deadly weapons should do much, more than any other practical device, for mitigating the evil, the greatest in our social system, which otherwise contains much of which we are justly proud. It is related that an English tourist who had travelled through the South was questioned on his arrival in New York about his impressions of the Southern country. His impressions were very favorable, he liked the country and the people.

"How about the security of life in the South?"

"Oh, as to that, a man only lives down there because nobody wants to kill him."

While this remark savors of extravagance, it is truly suggestive of the status of our criminal jurisprudence.

T. G. DABNEY.

Clarksdale, Miss., August 5.

Notes.

A. C. McClurg & Co. announce for publication in September "With Wordsworth in England," by Mrs. MacMahan; "A Handbook of the Philippines," by Hamilton M. Wright; "The Great Plains, 1527-1870," by Randall Parrish; and "The Campaign of Santiago de Cuba," a strategic history, by Col. H. H. Sargent, U. S. A. The same firm will add four new volumes to the series of Life Stories for Young People: "Joseph Haydn," "Frithiof Saga," "Hermann and Thusnelda," and "The Swiss Heroes."

The Hon Charles F. Warwick's "Mirabeau and the French Revolution," heretofore published by J. B. Lippincott Co., has been taken over by George W. Jacobs & Co. Messrs. Jacobs & Co. have also in preparation a companion volume to the above, to be entitled "Danton and the French Revolution," which will be issued some time next year, to be followed later by "Robespierre and the French Revolution." While each volume will be complete in itself, they are so planned that the three together will form a complete history of that period.

G. P. Putnam's Sons will publish this autumn "Stories and Sketches," by the late Dr. Mary Putnam Jacobi. The volume is described as "a memorial to the life of an earnest worker, the activity of whose intellect could not be entirely restricted within the channels of her chosen profession." The same firm will issue an English translation of Dr. Max Lenz's "Napoleon," a work which has been successful in Germany.

Three of Richard Jefferies's books are to be reprinted by Thomas Y. Crowell & Co.: "The Life of the Fields," "The Open Air," and "Nature Near London."

The Henry Altemus Company announces for publication in September "The Bible as Good Reading," by Senator Albert J. Beveridge.

Baedeker's "Switzerland" is just issued in the twenty-second edition. It contains xl. and 551 pages, 69 maps, 18 plans, and 11 panoramas. The repute of this handbook is so firmly established that nothing further need be said on that score. Charles Scribner's Sons are the American agents.

The *Library World* of England begins its tenth year of publication with an editorial survey of the progress made in Great Britain in library matters since 1898. The following are the principal facts noted: In 1898 no more than 350 places in the United Kingdom had adopted the Public Libraries acts, and in many of these the buildings and equipment were shabby and ineffective; to-day, 520 places have adopted the acts, and a large number of old and new library areas have erected fine buildings. Along with this expansion—and more important, in the estimate of the editor—is the great improvement in the training and qualifications of librarians. Other items are, (1.) rapid extension of the system of open shelves; (2.) the gradual but continual decrease in the percentage of fiction circulated, along with a very marked increase in the total circulation; (3.) the movement in favor of limiting the supply of newspapers and obliterating betting news; (4.) better provision for children and a better co-ordination of the library and the school.

The July issue of the new quarterly, *The American Journal of International Law*, which has just appeared, strikes a high level. Its opening paper is by the Hon. Simeon E. Baldwin, judge of the Connecticut Supreme Court, and an active worker in the Yale Law School, on "International Congresses and Conferences of the Last Century as Forces Working Toward the Solidarity of the World." With his historical citations Judge Baldwin presents comprehensive generalizations. The great œcumenical councils of the Roman Church were international congresses, in which each nation of Christendom was represented. The movement of modern society, however, is away from ecclesiasticism in politics. The Congress of Münster was the first of the new order. In 1815 that of Vienna took action towards suppressing the slave trade, and securing free navigation of international rivers. Since 1826 more than 120 conferences of a diplomatic character for promoting social and economic objects have been held. Their usefulness is illustrated by what the Postal Union accomplished. Four conferences held at The Hague since 1893 have achieved the adoption of uniform rules among ten different European nations regarding marriages, divorces, guardianships, while one held at Montevideo has brought similar results to five South American Powers. Judge Baldwin is fully convinced that the unifying influence of the first Hague Conference, 1899, has been most important. In a forcible paper on the second Hague Conference, Dr. Hill, now at The Hague as American minister, and a delegate to the Conference, more strongly emphasizes than does Judge Baldwin the achievements of that first conference. He declares that, notwithstanding the two succeeding wars, the work done at that time constitutes the most notable and enduring triumph of human reason of the nineteenth century. The conference not only created a permanent tribunal; it provided that "Powers, strangers to the dispute, have the right to offer good offices or mediation, even during the course of hostilities"; that "the exercise of this right can never be regarded by one or the other of the parties in conflict as an unfriendly act"; and that, as the result of action under this article, peace between Russia and Japan was concluded at Portsmouth. The impetus, however, given to the principle of judicial settlement of international disputes, was the greatest achievement of the First Hague Conference. Dr. Luis M. Drago, foreign minister of the Argentine Republic, whose letter of December 29, 1902, to the Argentine minister at Washington formulated what is termed the Drago Doctrine, contributes a discussion of "State Loans in Their Relation to International Policy," first making it clear that his original proposal applied merely to public or national debts, not to private obligations, then reviewing the attitude of the United States towards the questions raised and the status of those questions before the Hague Conference. Prof. Albert Bushnell Hart's paper, "American Ideals of International Relations," contains a useful historical conspectus of relations into which our Government has been drawn. He criticises the inconsistency of our attitude in favoring the open door for China and selfishly imposing extreme tariff rates on our own dependents, the Filipinos. As against Mr. Olney's declaration, in the Venezuelan controversy of 1895, that the fiat of the United States is law on this continent, Professor Hart eulogizes the spirit which would develop, through the Hague Tribunal, the method of settling international controversies independently of the fiat of any particular government. The 85-page Supplement to this number contains documents of great value, including our new Consular Service regulations covering appointments and promotions.

A very chatty book on the "New Egypt" which has grown so rapidly during the past decade has been sent forth by A. B. de Guerville (E. P. Dutton). It is well printed and excellently illustrated. Its perusal will be of advantage to those who are purposing to visit Egypt and the Sudan, giving them some glimpses of things which the ordinary tourist neither sees nor realizes. The author had many opportunities of seeing and talking with Egyptian officials, both native and British, and he has given the reader the benefit of them. But of the antiquities of the land he is profoundly ignorant, and many of the things which he writes must be taken with cau-

tion. His interest, however, is in things modern, and to these he sticks closely for the most part. But he has marred his book by introducing many rather indelicate stories and incidents and comments which greatly detract from its dignity and from one's pleasure in reading it.

Prof. Ferdinand Schwill of Chicago has succeeded in the enterprise of reducing all European history from the revolt of Luther to the marriage of King Alfonso into one small volume ("A Political History of Modern Europe," Scribners). His method is that of the text-book, and the ideal that has inspired it is the compression of the greatest amount of history into the least possible space. In the latter respect, the book is eminently successful; it almost suggests Ploetz's "Epitome." As to the historical element, one need not go beyond the author's own ingenuous admission that his volume "must needs give the impression of being hurried and superficial, and be guilty of a large number of glaring omissions."

Lord Avebury's "Municipal and National Trading" (The Macmillan Co.) is the latest addition to the output of books upon a subject that vitally interests the British as well as ourselves. It would be highly agreeable to the reviewer to say that the volume is worthy of its distinguished author, but it is impossible for him to do so. The materials appear to have been gathered hastily, and are thrown together in slap-dash fashion. Long extracts are reproduced from familiar works, which are better known than this one can ever be, the selections are sometimes made uncritically, and not a few of the chapters are thoroughly incoherent. Some of our readers may remember that a certain American author recently got himself into very hot water by stating that the failure of the Prussian Government to make "group rates" on milk led to the stabling of countless thousands of cows in the city of Berlin. We observe with regret that Lord Avebury has reproduced this celebrated passage, *verbatim et literatim*, and shall expect to see the advocates of government ownership rend him limb from limb. To the general extension of public trading, whether national or municipal, Lord Avebury is stanchly opposed, and he is able to present a good many reasons why it is desirable to be extremely cautious in passing upon projects for nationalization or municipalization. With his conclusions, we can entirely agree, but this fact merely increases our regret that he has not taken the pains to present his case in a satisfactory and convincing form.

"The Cause and Extent of the Recent Industrial Progress of Germany," by E. D. Howard (Houghton, Mifflin & Co.), is the essay which received the first prize in the competition established by Messrs. Hart, Schaffner & Marx of Chicago, in 1905. It is a somewhat commonplace doctor's dissertation which reviews the industrial and commercial progress of Germany since 1871, and then discusses the causes contributing thereto. The industrial capacity of the Germans, their zeal in applying science to practical affairs, their genius for taking pains—all these and many other elements in the problem have been made tolerably familiar to us by the discussions of the last ten or a dozen years; and it cannot be said that Mr. Howard has made any substantial contribution to our knowledge of the subject. His essay may be useful, however, to readers who desire a general account of the rise of Germany to the rank of a great industrial and commercial Power. He would have done well to avoid such pitfalls as are set for the unwary by Mulhall's "Dictionary of Statistics," and he misleads his readers sadly when he tells them that the "profits" from the railways owned by the German states amount to $461,000,000. This figure can, at the most, represent the "earnings from operation"; the "profits," after allowing for debt charges, can be but a fraction of the amount stated. We wonder, too, why he persists in calling the Zollverein the "Zollvereine."

The recent issue of the *Vierteljahrshefte zur Stastistik des Deutschen Reichs* brings the complete statistics of the strikes in Germany during the year 1906. The whole number was 3,228, as compared with 2,403 the preceding year. The number of concerns affected was 16,246, or 1,766 more than in the year 1905. The total number of men who struck was 272,218, while those additional who were affected by the strikes was 24,433. In 2,343 cases the strikes were caused by a demand for higher wages, and in 452 cases for pay for extra hours. In 864 cases there was a demand for shorter hours, and in 202 cases recognition of the union was the object sought for. The number of strikes decided by compromise and arbitration is constantly increasing. The same issue of this official journal also reports that in the first quarter of the present year 293 strikes had been satisfactorily adjusted, which had affected 1,300 concerns, and compelled 19,564 workmen to remain idle.

The quater-centenary of the University of Aberdeen, 1906, was commemorated by the publication of "Studies in the History and Art of the Eastern Provinces of the Roman Empire," a collection of papers written by seven graduates of that institution. The field is restricted to Asia Minor, and the work is published under the editorial supervision of W. M. Ramsay, professor of humanity in Aberdeen, well known as the author of "Cities and Bishoprics of Phrygia." Professor Ramsay also contributes three of the papers. The volume is appropriate, because of the fact that during the past generation Aberdeen has taken the lead in the exploration of that field; according to the editor, the bulk of the work of her graduates equals that of all other explorers together. In an admirable study of "Isaurian and East Phrygian Art in the Third and Fourth Centuries after Christ," A. Margaret Ramsay, daughter of the editor, maintains the view of Strzygowski that the artistic revival of that time and place was a part of the reaction of the East against the dominance of Rome—a movement which found its most vital expression in Christianity. The student of law and institutions will be interested in "Epitaphs in Phrygian Greek," by A. Petrie, and in J. Fraser's "Inheritance by Adoption and Marriage in Phrygia." The English translations of the inscriptions treated will make these articles more widely serviceable. This feature is worth imitating. To the general reader, Professor Ramsay's paper on "The War of Moslem and Christian for the Possession of Asia Minor" will doubtless appear most attractive, because of its bearing on the "Eastern question," and of the liberal spirit in which the conflicting religions are treated. The writer praises the work of American educators in Asia Minor, and expresses the hope that "the creation of ideals and aspirations among the Moslem women" now in progress may eventually renovate and ennoble their sect. The volume, including several papers not mentioned here, is an example of Scotch solidity in scholarship.

Basque scholars will be interested in E. S. Dodgson's "Leiçarragan Verb" (Henry Frowde), being "an analysis of the 703 verbal forms in the gospel according to Matthew." Leiçarraga's translation of the New Testament, other portions of which have already been analyzed by the present editor, first appeared in 1571. It was dedicated to the then Queen of Navarre, the mother of Henry IV., and shows close study as well of the Greek text as of the French version by Calvin, of whose sect Leiçarraga became an adherent. The present volume is described as a "Lexicological grammar or a grammatical Lexicon." The rules and definitions are in every case illustrated by examples, those in French being drawn from "Le Nouveau Testament," printed for S. Honorati at Lyon in 1566. Should he have the means at his disposal, Mr. Dodgson proposes to put out similar synopses of the Epistles to the Romans and Corinthians, the Acts of the Apostles, and the gospels of St. John and St. Luke, as well as an analytical Index to the whole of the "Lexiçarragan Verb."

The Rev. J. R. Wilkinson's translation of Harnack's "Luke the Physician" (G. P. Putnam's Sons) renders one of the most noteworthy recent contributions to New Testament criticism available to English readers. General interest has been excited in Harnack's spirited defence of the correctness of the early tradition, which ascribes both the Acts and the third Gospel to Luke, but the more weighty portion of the essay is a minute examination of the vocabulary, syntax, and style of the "we-sections" of Acts, and a comparison, in these respects, with the remainder of Acts and also with the third Gospel. To those who are disposed to attach weight to linguistic arguments of this sort, the facts brought to light by Harnack will doubtless be convincing, for it must be said that he has discovered a large number of striking parallels. This method of proof, however, is more than a little precarious. The real question is not whether the tradition as to the author is correct, but whether the representation of the development of primitive Christianity and of the personality of Paul afforded by the Lukan history is true to fact. As to this larger question, Harnack does not offer much consolation to those who contend for the trustworthiness and reliability of the author of the first church history. The suggestion that the special interest of Luke in the Samaritans and in the women of the gospel story is to be traced to the evangelist Philip and his four prophesying daughters, is not likely to meet with favor.

Harnack appears to have a genuinely popular fondness for the connection of traditions with particular persons. The English translation corrects the statement of the German edition that the prominence of women in the third Gospel had not previously been noted, reference being made to Plummer. Whatever be one's opinion of the propositions on which Harnack lays chiefest stress, the value of the book as a contribution to the history of the fixing of the evangelic tradition cannot be questioned.

The plea for an undogmatic Church is not new, but J. M. Lloyd Thomas in "A Free Catholic Church" (London: Williams & Norgate) introduces a fresh phase into the discussion. Instead of the simplicity of worship and distrust of doctrine which have characterized liberal movements hitherto, he would have full recognition of the importance of dogma and the need of symbolism, maintained, however, in utmost liberty. His hope for substantial and permanent reformation, therefore, is along the line that would naturally be chosen by liberal Catholics, and his opinion is worth quoting:

It would hardly be astonishing if the men who will really organize the Free Catholic Church should turn out to be, not the advanced theologians of the Protestant school, but the more daring Liberals of the Roman Communion, precipitated to decisive and independent action by some such crisis as we now see going on in France. These would, at any rate, have the incalculable advantage of being able to bring to the modern movement not only a peculiar appreciation of what is essentially venerable in antiquity and a cultivated perception and taste in matters of ecclesiastical art, ritual, and symbolism, but also, what is far more valuable, that living concrete sense of the historical continuity of the Church without which every reformation is foredoomed to failure.

The continued prosperity of Australia and New Zealand has given a fillip to the publishing trade. Several Australian and New Zealand firms issue fiction, poems, and histories that command the approval of English and American critics and have gained a wide circulation. The popular English "series" has been at length imported, and Whitcombe & Tombs of Christchurch have projected one such called "Makers of Australasia." The initial volume will be on Capt. Cook, probably by Prof. Macmillan Brown of Christchurch. The next most important volume will be that on Sir George Grey. As Governor of South Australia, twice Governor of New Zealand through long and critical periods, High Commissioner at the Cape, and in later years Premier of New Zealand, he has many titles to attention.

Jens Lyng, once a lieutenant in the Danish army and lately editor of the Melbourne *Norden*, has just published a brochure on the part played by Scandinavians in Australasia (Melbourne: George Robertson & Co.). As in the United States, they have engaged in almost all occupations, save commerce, where they have failed; they have eminently contributed to acclimatize the profitable butter industry, and they have been prominent in sugar-refining. Their greatest names are those of Monrad and Müller Bishop Monrad was Prime Minister of Denmark when the disastrous Schleswig-Holstein war broke out, and he fled before the storm of unpopularity that broke on him. He settled in New Zealand, where his family still lives, though he himself returned to Denmark and was reappointed a bishop. Baron Sir Ferdinand von Müller was also a Dane, but only by naturalization; he ranks as the greatest of Australian botanists. Born in 1825, he became Government Botanist at Victoria in the early fifties. He was a heroic toiler, and regularly "put in, even when an old man, upwards of 120 hours a week." He was famous, but poor and eccentric. When he was short of cash, he reduced the quantity of sugar in his tea, and, to the last, contemplated marrying an heiress. When his old wooden bed broke down, he propped it with a tin box containing his twenty-six foreign orders and decorations. He wore wooden clogs, a long woollen muffler for cravat, and sometimes a tea cosy in place of a woollen cap. He died in 1896.

The last publication of the Folk-lore Society (1904) has for its subject "Jamaican Song and Story," of which Walter Jekyll has collected and edited numerous examples. As Miss Werner points out in the introduction, they are a mixture of European and African elements. The tales in so far as they are African are not Bantu in origin, like those of the Middle and Southern States of America, but have much in common with the folklore of the West Coast, or Upper Guinea, whence the negroes of Jamaica would seem to have been chiefly drawn. Most of the actors in them are animals, "Aunancy" (the word is Tshi or Ashanti for spider) playing much the same part in them as Brer Rabbit in the Bantu stories. They are not so interesting as the latter, but they have a dry humor of their own, not at all to be despised; the foreign stories, for example, "Mr. Bluebeard" or "The Three Pigs," have lost nothing by being imported. The tunes which make up the remainder of the volume fall under two main heads, "digging-sings" and dancing-tunes. The digging-sings are used as an accompaniment to field-labor. The words are often improvised, turning on pieces of current gossip. This is also the case with the dancing-tunes, the music of which is usually imported. Besides the formal dances, the steps of which are thoroughly known, there is an informal kind, mixed with horseplay known as "playing in the ring." The book ends with an appendix by C. S. Myers on "Traces of African Melody in Jamaica" and one on "English Airs and Motifs in Jamaica," by L. E. Broadwood. The former contains three interesting examples of music recorded in Sir Hans Sloane's "Voyage to Jamaica" in 1688

To Dr. Friedrich S. Krauss's enthusiastic study of gypsy folk-lore in general, and especially to his success in collating the 850 stories from Southern Slavs presented in the first four volumes of his "Anthropophyteia," published last year, is due his "Zigeunerhumor," volumes vii. and viii. of Der Volksmund (New York: G. E. Stechert & Co.). Krauss is reputed to have a vast amount of gypsy material at his disposal; but to insure the greatest authenticity, he his limited himself to the Serbo-Croatians, with whom he is best acquainted, and even in this he was assisted by Tihomir R. Gjorgjević and other well-known gypsy students. He believes that the gypsies are a better people than they are generally reputed to be, and he has found 250 stories illustrating their humor, of which sixty have never before been published. Sometimes the Western reader may be tempted to wonder where the humor comes in, and perhaps this would be the case more frequently if the considerate editor, knowing both the Germanic and Slavic ways of thinking, did not add an *Anmerkung* or two explaining the joke. Many of the stories, however, are as clever as the thousand and one German anecdotes that have found a place in text-books for schools and colleges; and some are surprisingly similar, showing either the influence of the same traditions, or the tendency of the human mind to run in the same channels. Not a few show a naïveté as pronounced as could be expected of these ever-wandering people. Thus, when a gypsy was asked, "For what purpose has God created you?" he replied: "That I may eat, drink, dance, and sleep." And another answered the question, "How do you manage to know, without a watch, when it is midday?" with, "By my stomach and the position of the sun." The stories are grouped together in seven divisions, according to the gypsy's idea of the abstract world, his sense of earthly justice, his principles in contending for perishable goods, his methods as a merchant and a dealer, his part in social intercourse, his nature as a social being, and his cleverness in telling fairy-stories. There is a bibliography of sixteen works bearing on the subject—but one or two in German—published between 1838 and 1905. Incidentally a pleasant picture of the life of the typical German-bred scholar is afforded in the narrative of how Krauss and Gjorgjević came together in Vienna in the spring of 1902, to look over Gjorgjević's rich collection of manuscripts, and spent four to five hours every evening for months examining the finds, *buchstäblich, Wort für Wort!*

In an interesting and profusely illustrated volume entitled "Mehr Licht," just published by Hinrichs in Leipzig, Prof. Friedrich Delitzsch of Berlin, author of "Babel und Bibel," derives the mediæval witchcraft delusion from Babylonian sources. That similar beliefs and practices prevailed among the Babylonians or Chaldeans is proved by the discovery and decipherment of the cuneiform inscriptions on a series of clay tablets called *Maglû* (burning), belonging to the library of Asurbanipal. These records show that the Babylonians attributed to witches a mysterious and malign influence, which could be counteracted only through the agency of fire, but as this end could be obtained by burning them in effigy their punishment was free from the horrors connected with witchcraft persecutions in Christian countries, where it has been estimated that this superstition has caused nine million innocent persons, of whom the great majority were the noblest and most intelligent of their day and generation, to be tortured on the rack and to be burned at the stake. Indeed, a decree of Hammurabi declared that whoever accused an innocent person of sorcery should be condemned to death and to the confiscation of his property. The sense of justice and the humane spirit manifest in this enactment present a striking contrast to the absurdities and atrocities enjoined and enforced in papal bulls, ecclesiastical canons, and the notorious tractate "Malleus Maleficarum." Professor Delitzsch's theory that

this pernicious infatuation was transmitted from the Chaldeans through the Egyptians to the Greeks and Romans, and the other European nations is questionable. He maintains that it originated in the inexplicable nature of the manifold sorrows and sufferings of mankind and especially the maladies to which all are subject. Such afflictions and calamities would he intelligible as penalties for sin; but why should upright and virtuous men and even saints he thus tormented, unless it be the work of Satan and his satellites? The easiest solution of this puzzling problem would be to ascribe all miseries and misfortunes of this kind to evil spirits acting through the medium of witches as their agents. But why should not other nations endowed with the same faculties in the same stage of intellectual development as the Babylonians, and giving rein to the phantasy in the same direction, account for the mysterious phenomena in the same way?

When Georg Büchmann, in 1864, made more popular Homer's expression, ἔπεα πτερόεντα, in his "Geflügelte Worte," he could hardly have hoped that the book would attain the widespread fame that it has. Yet, in forty-three years it has seen twenty-three editions, and its one hundred and fifty thousandth copy has just been issued from the press of the Haude and Spenersche Buchhandlung in Berlin. This latest edition, prepared under the editorial supervision of Eduard Ippel, is a still further enlargement of Büchmann's original work, extended by Walter Robert-tornow, and is more than ever an interesting volume; but the American reader will wonder if it might not easily have been prepared for a more extensive circulation. Catchy words and phrases from the Bible, from sagas and folk-stories, and from Oriental, classical, Germanic, and romance writers are compiled, of course, and many are accompanied by their exact counterparts in German; but in the 589 pages devoted to the text, there are very few extracts from American sources. Ben Franklin and his "Ça ira!" and George Washington and "Brother Jonathan," lead off the list; "Uncle Sam" is added; and the origin of the "yellow press" and the "open door" are given. Besides the above, however, only Irving and Cooper (classed as English writers) are mentioned. Strangest of all is the omission, under Dickens, of the immortal expectation of Mr. Micawber that something would "turn up"—a bit of English known to Germans wherever a word of English is spoken or read. Kaiser Wilhelm II. joins the ranks of literary celebrities in his frequent use of the sentiment, "Blood is thicker than water," and in his prophecy that Germany's "Zukunft liegt auf dem Wasser"; but neither Hauptmann, Sudermann, nor Frenssen appears to have said anything very taking, and Wildenbruch is mentioned but once. There are biographical sketches of Büchmann and Robert-tornow, with a portrait of the former, and 178 pages of index, naturally an essential for such a work. In the light of the antiquated, if not impossible, English retained in every German-English, English-German dictionary edited abroad, and the strange omissions of American and English topics in the best of the German encyclopædias, it would be interesting to try the experiment, in the preparation of a book like this, of adding an American editor to the board.

Prof. Ernesto Masi of Florence has recently prepared for the Biblioteca Storica Andrea Ponti a "Catalogo di Alcuni Libri per la Storia del Risorgimento Italiano," which will be indispensable to all readers or students in the field of modern Italian history. In the course of less than one hundred pages of text Professor Masi gives not only a brief and acute opinion on several hundred books, but also a remarkable analysis of the evolution of the Risorgimento itself. He divides his subject into eight periods, beginning in 1748, when the Peace of Aix-la-Chapelle marked the dawn of modern conditions, and ending in 1870, when the unification of Italy was completed by the redemption of Rome. Readers who know Professor Masi's essays need not be told that even in what modestly purports to be only a *catalogue raisonné*, hut is in fact much more, his penetrating insight, his compact, witty phrases, and his ripe judgment abound. He is judicial without sacrificing his personal preferences. It would he difficult, for instance, for anyone to state more fairly than he has done, the merits and defects of the large works of Cesare Cantù or of Tivaroni, or of Saffi; while his two or three-line summing up of the qualities of a monograph is usually definitive. He hears all sides, searches with equal curiosity the testimony of Blacks and Reds, and is concerned to see not what fits his theory hut what actually occurred. "We do not scruple to confess," he says, "that admiration for Count Cavour is the sole partisanism which still remains in our mind." At the end of his text, he gives in chronological sections the hibliographical lists. The books he cites are all either in Italian or in French. This catalogue should be in every library, and may serve as a model for bibliographers who are also men of culture.

Psychologists of tribal and racial characteristics have not yet explained why South Italy has been so prolific in philosophers. Thomas Aquinas, Giordano Bruno, Campanella, Vico—to mention only the names of the most famous—were natives of the former Kingdom of Naples, and today Prof. Benedetto Croce, a Neapolitan, is the acutest philosophical mind in Italy. Although he has turned aside from philosophy to criticism, in the broadest meaning of that art, and devotes himself chiefly to the editing of the remarkable journal, *La Critica*, he recently published "Ciò Che è Vivo e Ciò Che è Morto della Filosofia di Hegel," a compact and pithy hook, which should find an English translator. Professor Croce is hy tradition and training an Hegelian, hut not a doctrinaire, so that he has heen able to discriminate between the transient and the permanent in Hegelianism as it stands to-day. An ample bibliography adds to the usefulness of his analysis for students. Professor Croce has also edited "Studi Letterari e Bizzarle Satiriche" of that fervid Neapolitan genius, Vittorio Imbriani, who died prematurely in 1885. Among these essays are papers on "The Value of Foreign Art for Italians," "The Laws of the Poetic Organism," "Berchet and Italian Romanticism," "Dante's Vices," and "Alfieri's Style." The literary critic, the philosopher, the sociologist, and the mere "gentle reader" will each find profit or entertainment in Imbriani's lively pages. Both volumes are published in the excellent Biblioteca di Cultura Moderna (Bari: Gius Laterza e Figli).

In the *Bullettino Senese di Storia Patria* (vol. xiv., 1907, Fasc. 1) some curious details are published touching the status of the Jews in the fourteenth and fifteenth centuries under the penal law. The nature of the article will, perhaps, he best indicated by an example. It appears that in 1348 a certain Jacoh Daltali, a Hebrew, "homo male condictionis, conversationis, vite et fame," was condemned to death by the Potestà for adultery, theft, and highway rohhery. After his sentence the convict expressed willingness to embrace Christianity and was thereupon baptized. His case was once more brought before the Potestà, who now held that he must be forthwith liberated on the ground that "Jacobus ebreus" had absolutely ceased to exist, and that his crimes could hy no means be visited upon Lorenzo Domenico, the Christian, "aqua sacratissimi batissimi renatum." In 1472, two other Jews escaped punishment under like circumstances by a similar timely conversion. The documents in both cases are published *in extenso* and are worthy of study. The article, entitled "Conversioni," is signed "M."

Antonio Favaro, professor of law in the University of Padua and editor of the "Editione Nazionale delle Opere Galileo Galilei," issued under the auspices of the King of Italy, has published a book entitled "Galileo and the Inquisition," in which all the original documents referring to his persecution and prosecution, preserved in the secret archives of the Vatican and the Holy Office, are printed for the first time. Although the facts are well known, the form in which these inquistorial proceedings are here presented invests them with peculiar interest. Pope Urban VIII., who as Cardinal was a patron of Galileo, but through offended personal vanity became his cruel persecutor, appears in a very unfavorable light.

Signora Fanny Zampini-Salazar, in "La Vita e le Opere di Roherto Browning ed Elisabetta Barrett-Browning" (Rome: Società Tipografico-Editrice Nazionale), provides for Italian readers a sympathetic hiographical sketch, enriched with translations of many letters and with paraphrases of the principal poems of Robert and Mrs. Browning. Italy was so much the home of the poets that such a work, hy a writer who, like them, has Anglo-Italian affinities, ought to interest English-reading Brownings. Senatore Fogazzaro contributes to the volume a short preface, in which he declares himself an equal admirer of the "arduous Robert" and the "imaginative Elizabeth." He particularly esteems "Aurora Leigh."

Volume XXXIV. of the Transactions of the Asiatic Society of Japan is completed in Part iv. (pp. 224), notable for three papers which reveal why the inside bolt of the closed Japan of 1853 was so readily withdrawn, and Perry's work made so easy. Outwardly one would suppose that warships compelled the opening of the hermit nation. Acquaintance with facts shows that the work was done mainly within, and

that Japan's course has, before and since Perry, been one of steady evolution. Prof. Arthur Lloyd's paper on "The Historical Development of the Shushi Philosophy in Japan (1561-1860)" is virtually a survey of Confucianism in that country. First imported in the sixth century as simple ritual and ethics, it remained in practical alliance with Buddhism and Shinto. After its twelfth century restatement, in China, by Shushi (Chu Hi), the neo-Confucianism came to Japan flowing in two streams. Shushi's forms were in the seventeenth century made national orthodoxy by the Yeddo shogunate, and in the next century Shushiism was a virtual State inquisition, hostility to which meant torture, imprisonment, decapitation, or *hara-kiri*. Opposed, both in China and Japan, to Shushi's system was that of Oyomei, which cast aside the subtleties of the Chinese schoolmen's speculations on human nature and deity (impersonal), and identified knowledge and action. Under Shushiism most of the conservatives, before the pivot year of 1868, were reared; under the Oyomei philosophy, almost all of the men who have made the new Japan. In recent years modern Occidental philosophy has virtually displaced Confucianism in Japan. R. J. Kirby's paper on "Educational Control, by Dazai Jun," who wrote before Perry's time, shows that some native seers protested vigorously against feudalism and repression of thought, and that the ultimate and irresistible forces of the revolution of 1868 worked from within, and not from without. Dr. D. C. Greene publishes the correspondence, in Japanese, Dutch, and English, of King William II. of Holland in 1844, advising the Japanese to enter into friendly relations with other nations. In the valuable discussions (p. 23) it is shown beyond cavil that "while Perry and his treaty may properly enough be taken as marking an epoch in the history of Japan, they did not set in motion the really efficient forces which have created the new life."

In the Paris *Figaro* M. de Mathusieux has given a provisional account of his excavations in the ancient Cyrenaica, the most important Hellenic colony in Africa. He lays stress on the great possibilities of the site, which has never been properly explored and which must contain many ancient Greek remains. The present ruins are extensive and contain remains of streets, aqueducts, temples, theatres, tombs with inscriptions, fragments of sculpture, and traces of paintings. There is a danger that these ruins will be covered with sand from the Libyan desert, and therefore the sooner systematic excavations are undertaken the better.

The International Council of Unitarians and other liberal religious thinkers and workers, to be held in Boston, September 21 to 27, will bring to America an unusual number of European savants to participate in the congress. From Germany alone there will be at least three leading lights of progressive theological and philosophical thought: Professor Pfleiderer of Berlin, who was also present in St. Louis; Professor Martin Rade of the University of Warburg, the brilliant editor of the *Christliche Welt*, the leading organ of progressive theology in the Fatherland; and Dr. Max Fischer, whose advanced views have made him the subject of discipline on the part of the church authorities. In addition, Prof. R. Eucken, the famous Jena philosopher, sends a paper. Austria, Holland, England, France, Denmark, are all represented on the programme, which has just been completed and published in several languages.

Among the most famous secondary schools of Prussia, is the Royal Joachimstal Gymnasium in Berlin. The three-hundredth anniversary of its foundation will be celebrated this month with literary exercises, including the presentation of the "King Œdipus" of Sophocles in the original Greek on the 22d and 24th.

THE CAMBRIDGE MODERN HISTORY.

The Cambridge Modern History. Planned by the Late Lord Acton: Edited by A. W. Ward, Litt.D.; G. W. Prothero, Litt.D.; Stanley Leathes, M.A., Volume IV. The Thirty Years' War. New York: The Macmillan Company. $4 net.

This great historical undertaking goes steadily on its way, and has now, after an experience of more than three years, during which successive volumes have been appearing, settled down into a pretty uniform level of quality and a pretty uniform method of treatment. In each of the first two or three volumes the number of contributors was comparatively large; they were varied in training and character; their contributions were correspondingly diverse in manner and style. The last two or three volumes (seven have now appeared) were the work of fewer writers; but in that which now lies before us we find chapters by sixteen, several of whom appear for the first time. They are as follows: Six of the chapters, all of the first importance, because they include the tangled history of the Thirty Years' War and the Peace of Westphalia, are from the learned and practised pen of Dr. A. W. Ward, who is one of the editors of the "Cambridge History." Two, those on Richelieu and Mazarin, are by another editor, Stanley Leathes. Four are by the third editor, Dr. G. W. Prothero, who, in two of them, has the coöperation of Col. E. M. Lloyd. These four cover the great civil war in England. Two other chapters are by Dr. W. A. Shaw, two by W. F. Reddaway, and the remainder by Horatio Brown. Dr. Tanner, Professor Hume Brown of Edinburgh, Professor Firth of Oxford, R. Dunlop, Dr. Moritz Brosch, Professor Egerton of Oxford, Edmundson, Clutton Broch, and Émile Boutroux.

These names prepare the reader for the maintenance of a high standard, and a high standard is, in fact, maintained throughout. Everywhere one finds care, accuracy, and a businesslike spirit, which presents the facts in a clear and coherent way. One might almost wish for a little more comment and reflection, a little more in the way of appreciative study of the leading characters and discussion of the issues which from time to time come up.

The *pièce de résistance* of this volume is the Thirty Years' War. It broods over the landscape like one of those summer thunderstorms among the hills which go wandering hither and thither round the sky, flashing lightning now from the east and now from the west, bursting with torrents of rain now at one, now at another part of the valley. The story of it is not simply a dreary and dismal story, relieved only by the nobility of Gustavus Adolphus and the striking, if enigmatic, personality of Wallenstein, but a very intricate story, which it needs profound knowledge and much skill to make intelligible. Dr. Ward (master of Peterhouse in the University of Cambridge, England) fortunately possesses these advantages, and has done all that can be done to straighten out the tangled tale. He dwells upon the sufferings of the German people and the economic ruin of the country in terms which are the more impressive because he is a cautious and sober writer, not given to exaggeration. They make useful reading for those historians who, struck by occasional acts of heroism, have dwelt on the moral services which war renders to national character:

> The effects of the Thirty Years' War furnish perhaps the most appalling demonstrations of the consequences of war to be found in history. The mighty impulses which the great movements of the Renaissance and Reformation had imparted to the aspirations and efforts of contemporary German life, were quenched in the century of religious conflict which ended with the exhausting struggle of this war; the mainspring of the national life was broken, and to all seeming, broken forever. The ruin of agriculture was the most striking, as it was the most far-reaching, result of this all-destructive war. Each one of the marches, counter-marches, sieges, reliefs, invasions, occupations, evacuations, and re-occupations was accompanied by devastations carried out impartially by "friend" or foe. For the peasants who dwelt upon the land there was no safety except in flight; their harvests, their cattle, the roof over their heads, were at the mercy of the soldiery; and as the war went on whole districts were converted into deserts. . . . The destruction of villages was probably carried in Bohemia to the most awful lengths. Of a total of 35,000 Bohemian villages, it is stated that hardly more than 6,000 were left standing. . . . A comparison of statements as to particular territories in Germany seems to show that the population of the Empire had diminished by at least two-thirds, from over sixteen to under six millions. In accounting for this loss it was reckoned (but how could the reckoning be verified?) that not far short of 350,000 persons had perished by the sword; famine, disease, and emigration had done the rest. . . . During more than a generation after the conclusion of the war a full third of the land in northern Germany was left uncultivated. Cattle and sheep diminished to an extraordinary extent, and many once fertile districts became deserts inhabited by wolves and other savage beasts. The cultivation of many products of the land passed out of use in particular districts, or altogether. . . . As the war reduced agriculture to an almost hopeless depression, and lowered the condition of the peasantry to a level at which it remained for the better part of two centuries, so were its effects hardly less disastrous upon the middle or burgher class and upon the trade and industry to which the members of that class had primarily owed their prosperity. The population of the towns, as a whole, is estimated to have declined during the war in a ratio less by one-third than that of the country districts. (Pp. 417-419.)

Dr. Ward proceeds, in a passage too long for quotation, to show how the ruin of German agriculture and commerce told upon the cities. The Hanseatic towns declined, except Hamburg and Bremen, whose position on the North Sea gave them a better chance than those which touched the Baltic. The two great commercial centres of the south, Augsburg and Nürnberg, also lost their prosperity and preëminence. When we are struck by the extraordinary industrial and commercial development of Germany during the last forty years, it is

well to remember that the apparent stagnation in which she lay during the eighteenth century was not due to any want of natural resources or of practical ability, but largely to one terrible political catastrophe which not only ruined the country economically, but left it in a political situation unfavorable to economic recovery, because it was divided up among a great number of petty States, governed in an arbitrary fashion by selfish princes, who were not only selfish, but shortsighted, and whose system of tolls, tariffs, and imposts retarded the revival of industry and the development of commerce.

We have all become so much accustomed of late years to dwell upon geographical and other physical conditions as the dominant factors in history as sometimes to forget what a tremendous and lasting effect political calamities may have. The Thirty Years' War, in the setback which it gave to the growth of Germany in pretty nearly every side of life and every form of activity, is a useful corrective to this tendency. On its directly political effects, in the opportunity which it opened to France to secure that leading position in Europe which she held for at least a century, there is less need to dwell. The policy of Richelieu, favored by the Thirty Years' War, made the European dominance of Louis the Fourteenth easy, despite the internal troubles from which France had been hardly more exempt than were Germany and England.

Next to Germany, England is the country whose annals are in the seventeenth century of most permanent interest and significance. In one respect they are even of far higher significance, for they brought out political principles and they furnished constitutional—or unconstitutional and revolutionary—precedents which came to exert a far-reaching influence upon other countries and above all upon the English colonies in North America. To American readers, therefore, the history of the struggle of King Charles the First with his Parliaments, ending in the Civil War, the Protectorate, and the reëstablishment, on a changed basis, changed more in fact than in form, of the ancient monarchy, will be the most interesting part of this volume. It has been dealt with by Dr. Prothero, Col. Lloyd (where the military part comes in), Dr. W. A. Shaw, Dr. Tanner (for the naval parts), and Professor Firth, who has succeeded to the place long held by the late Professor Gardiner as the highest living authority on the Commonwealth period.

All these writers have the merit of approaching their subject in a candid and impartial spirit. It may seem that this is a quality too obviously necessary for a historian to need mention or commendation. Nevertheless, there are English historians in whose breasts the embers of partisanship are not wholly extinct when they deal with the seventeenth century in England, while as regards Scotland and Ireland, one cannot confidently expect to find fairness. Round the Rebellion and so-called "massacre" of 1641 in Ireland, round the Covenanters and their enemies in Scotland, the fire of controversy still now and then continues to leap up out of its ashes. We find every ground, however, for trusting Dr. Prothero, and Dr. Shaw, as well as Professor Firth. They tell the story clearly and carefully; and almost the only criticism we feel disposed to make is that the origin and evolution of those political theories in which the period of the Civil War was fertile might have been dealt with rather more fully and indeed have had a chapter to itself, such as that chapter (somewhat too dry and curt) which is given to the proceedings of the Westminster Assembly of Divines.

The genealogy of doctrines relating to the nature and power of government, civil and ecclesiastical, is a topic of so much interest and importance that in a great historical treatise of this kind it deserves to be treated as a main line of investigation and description, instead of as a mere incident in the course of public events. One may say that the theoretical discussion of these subjects began in the eleventh and twelfth centuries, with the struggle between church and state over the question of investitures, and is continued as part of the general conflict between the spiritual and the secular powers till the middle of the fifteenth century. After a short period of quiescence, it reëmerges in the controversies to which the Reformation gives rise, and rages from the contemporaries of Bodin down to the contemporaries of Locke, in forms which are all more or less colored by religious feeling or ecclesiastical dogma. But in France and Germany, in the hands of the Jesuit controversialists, and of Protestants like John Althaus, it is always doctrinal or speculative. The English parliamentary conflict and the Scotch revolutionary movements, which began with the famous General Assembly at Glasgow in 1638, supplied the first opportunity for giving practical effect to theories regarding the relations of kings to subjects, and the rights of the civil magistrate, whether under a monarchy or a republic, over the conscience and the worship of the citizen. Hence, the greater actuality of the discussions of these topics in England; hence the added value which discussion had when theories could be brought to the test of working, as they were in the long struggle between the Presbyterians and the Independents in the days of Cromwell, and in the parallel struggle, on a far smaller scale, but of hardly less real significance, between the Puritans, who ruled Massachusetts, and Roger Williams. In those days the questions at issue were debated primarily as they affected religion. In the eighteenth century their ecclesiastical trappings had dropped off them. They stood forth in the minds of the insurgent American colonists in and after 1775 as political questions, and everybody knows what they became in France and in Europe generally from 1789 onwards.

It is an almost inevitable consequence of the plan of this series which commits to different writers different short periods or phases of history, that a character or a career which extends over several of these periods may in no single chapter be fully dealt with. With Gustavus Adolphus and Richelieu, Oliver Cromwell is the most remarkable figure in the epoch covered in this volume (1618-1660). Gustavus is briefly, but effectively dealt with by Dr. Ward. Richelieu is similarly handled in a very terse and weighty paragraph by Mr. Leathes (p. 157). We do not find any similar connected view of the great Protector, summing up his gifts and characterizing his policy. This is, however, the less necessary, because Dr. S. R. Gardiner, in his great history and minor writings, has provided ample material, and delivered what may prove to be a final judgment. There is nothing in these chapters to affect that judgment. Cromwell, as protector, had an extraordinarily difficult situation to deal with: and was much less master of events than the superficial students of earlier days had assumed. He was sincerely anxious to be as much of a constitutional ruler as he possibly could. But he was not only constantly threatened by opposition and by conspiracies from both sides, from the Republicans on the one side and the Royalists on the other; he had also the army to think of and to keep in hand, and he was frequently obliged to depart from his own views of the best course in order to secure the support of that necessary basis of a power which meant order and peace. The army, although in a sense his own creation, was a force which neither owed him that sort of loyalty which an hereditary king can command nor felt towards him that personal attachment which a successful adventurer inspires who leads his troops to foreign conquest and rewards them by gifts made at the expense of his own civil subjects or of the enemy. The army had its own ideas and purposes, which were sometimes the more difficult to overcome because they had their root in what it deemed its principles. All things considered, Cromwell contrasts very favorably with most men who have risen to power in the midst of a revolution.

This notice must not end without some mention of two very interesting chapters devoted, one to what is here called the "Fantastic School" of English poetry, especially Donne, Herbert, Vaughan, Traherne, Crashaw, and Marvell; and the other (by M. Boutroux) to the movements of philosophic thought embodied in Descartes, Gassendi, and Pascal. Both chapters are in their respective ways singularly penetrating and suggestive. Nor ought we to forget the bibliography. This has been a prominent feature of the "Cambridge Modern History" from its beginning. The present volume contains a list of books, pamphlets, and manuscript sources bearing upon the Thirty Years' War and Peace of Westphalia of quite exceptional fulness and value. It occupies seventy pages and ought to be of the greatest possible service to all future students of this extraordinarily difficult period.

CURRENT FICTION.

A Mirror of Shalott. By the Rev. Robert Hugh Benson. New York: Benziger Bros.

Father Benson, like the other brilliant sons of the late archbishop, is a fluent and spirited writer. Like his brother, the don, he pursues the theme of the moment with a certain breathlessness, a wistful reaching after the solution of problems of human character and experience which can never, we suppose, be absolutely solved. But for its garb of fiction and its Romanist feeling, this volume might have been written by the author of "From a

College Window" and "The Gate of Death." It might he called a Decameron of the preternatural. A group of priests, of many nations and temperaments, meet in "the *sala* of the presbytery attached to the Church of S. Philippo in Rome." At supper the talk has turned from miracles upon modern psychical manifestations: "levitation, table-turning, family curses, ghosts, and banshees." One of them, an Italian, expresses disbelief in all such phenomena, and swears that no one present "has such a tale at first hand." Another asserts that all of them, including the incredulous Father Bianchi, must have had some personal experience of the preternatural, and volunteers to tell a story of his own, in the expectation that the rest will eventually take their turn. So it comes about, the number of tales being swelled hy a succession of guests, both lay and clerical, and concluding with the author's own story. The result is not a series of ghost stories in the ordinary sense. The spook here is nothing for his own sake; indeed, the mere apparition plays little part in what is really a study of the unseen and malignant Presence. Father Benson's "mirror" shows certain dark reflections of that evil somewhat working against righteousness, of whose existence and activity he evidently has no doubt. In specific manifestations of this malign personality he does not profess or invite helief. "I maintain," says the "Monsignor Maxwell" who presides ex-officio over these informal conferences, "I maintain that agnosticism is the only reasonahle position in these matters. Your common agnostic is no agnostic at all; he is the most dogmatic of sectarians. He declares that such things do not happen, or that they can be explained always on a materialistic basis. Now, your Catholic——"

Why, the Protestant mind may find itself inquiring, should not faith embrace manifestations of the power of the Adversary, as well as of miraculous beneficence? Does not the testimony of the Scriptures and the Fathers afford basis for belief in both phenomena? Our narrator, at all events, is satisfied with the dictum of his superior. He receives permission to put the series of tales in writing, hut is enjoined to record the fact that none of the story-tellers "commits himself to belief" in the experiences which he or the rest may have set forth. Nevertheless, the whole animus of the book is toward acceptance of the given phenomena. The most moving of all the narratives is the experience of "Father Girdlestone," a priest of singular purity and spirituality, who, in youth, had been appointed to the curacy of a small and remote parish in Cardiff. The dream came to him of building, tbere in the wilderness, "a great church to God's glory." As the plan begins to take shape in his fancy he is suddenly assailed by the consciousness of a baleful influence, or, rather, personality, deliberately setting itself in opposition to him. The first attack was comparatively gross and palpable, though its form could not be expressed in ordinary human terms. The figure of sound is that which the priest is driven to use: "That sound, if I may call it so, was not that of a material object; it was not a cry or a word or a movement. Yet it was in some way the expression of a personality. Shall we say," he stopped again—"well, do you know what the sound of a flame is? There is not exactly a vibration—not a note—not a roar, nor a—anything." Later, the attack is renewed, more suhtly, but as unmistakahly; in the most precious moments of spiritual experience; and the young priest is driven nearly to madness before the hour of his victory comes.

Bar—20. By Clarence E. Mulford. New York: The Outing Co.

Twenty-five chapters of gunpowder smoke, of shanty towns in New Mexico or Texas, thick with dust, pierced with hullets, strewn with prostrate forms of cowboys. Terse descriptions of alkali plains, of Gila monsters, cayuses, and the playful manners of the Bar-20 outfit. This is the effect of Mr. Mulford's hook; story it can hardly be called. In time, the figures of Buck and Hopalong Cassidy stand out in low relief from the background of indistinguishable Petes and Shortys and Skinnys. The narrative is full of swing, so full as to swing past at top speed without making any particular impression beyond the fact that Bar-20 invariably worsts its enemies, whether these he Indians, sheriffs, greasers, or the crowd from C.-80. There has seldom been such wholesale slaughter since Scribe's bloody novel of "Piquillo Alliago." Not that Mr. Mulford otherwise suggests Scribe's four-volumed epic. On the contrary, he almost abuses the American art of condensation. Used with restraint, there is style and flavor in such elisions as "On the third deal he objected to the way in which the dealer manipulated the cards, and when the smoke cleared away he was the only occupant of the room." The trouhle, however, about the frequent and conscious use of any trick of this kind is that the reader soon finds it out, after which the flavor evaporates. Flavor is an evanescent quality. "Yore plum loco, yu are. Don't yu reckon they can hit a blue shirt at two hundred?" strikes the palate as a trifle flat, as if that particular cork had already been drawn and the beverage served.

Boys, however, in the primitive warrior stage, will probably relish Hopalong's prowess, and, as he never kills any but Bad Men (unless attacked), his example is not likely to effect any practical damage.

A Dull Girl's Destiny. Mrs. Baillie-Reynolds. New York: Brentano's.

The audience which responds to Mrs. De La Pasture will welcome "A Dull Girl's Destiny." This is the old-fashioned English novel of middle-class society, agreeably written, leisurely, conventional. While never very difficult to lay down, it is by no means a weary task to take up. The types of people are perhaps a trifle over-accented; the dull girl rather helies her name from the first. The element of difficulty, so essential to a heroine's development, is supplied through one of those misunderstandings of which real life is so much more chary than fiction. The heavy artillery of analysis, however, should not he trained upon an amiahle, unpretentious story of this kind, since its obvious qualities are neither suhlety nor penetration, but a wholesome right-mindedness, a mild humor, and unfailing good taste.

Science.

OBSERVING AN ANNULAR ECLIPSE.

ALIANZA, Tarapacá, Chili, July 10.

An almost ideal point for the work of a great telescope, this enormous plain of Tamarugal, verdureless, rainless, over three thousand feet above sea level, offers even now, at the middle of its winter, nearly 90 per cent. of clear skies, morning after morning dawning in cloudless splendor, moving on to nights of limpid steadiness. During December, January, and February, when at its hottest, the changelessly hurning hlue overhead is said to hecome all but wearyingly monotonous, a characteristic of which no astronomer would, perhaps, complain; but July and August are now and again diversified by the *camanchaca*, or sea fog, from the Pacific, which, enveloping Iquique and the coast quite constantly in winter, occasionally drifts above its usual limit of altitude to the top of the cliffs, even rolling on, and, hriefly, over the pampa, lying well behind the line of coast hills. Even when making its infrequent appearance here, the mist has generally burned off hefore nine o'clock in the morning. Genuine clouds are few, and usually cirrus in character. Wind blows so little in this south pampa that dust storms are rare; and there is often an admirable steadiness of atmosphere, both by day and by night, almost never found at or near sea-level.

The eighteen-inch Amherst College telescope, hard at work on Mars for the past three weeks, has been withdrawn for a day or two by Professor Todd, from its satisfactory revelation of canals and oases, to interrogate the phenomena of an annular eclipse passing to-day accommodatingly over the station. It has been concluded, somewhat hastily, perhaps, that annular eclipses can reveal little as to solar secrets. They have received but slight attention from astronomers, no expeditions having been fitted out in the past to follow their wide tracks into remote regions; yet practically all the phenomena attending total eclipses, except the corona, have appeared during these more frequent obscurations. Had it not heen for our expedition to the Chilian desert for the study of Mars at opposition, the annular eclipse of to-day would probably not have been observed with the big telescope. Occurring, as it were, at our very doors, however, in the week during which Mars approaches his nearest, we could have no wish to ignore it. In solar radiations other than light and heat, research may be conducted almost as well during annular as total eclipses; and there are always chances of revelation in every celestial event.

The Lowell expedition reached the pampa on June 17, and within a few days the largest refracting telescope ever used in the Southern hemisphere was set up and ready for work. Among tbe assistants on the expedition are A. G. Ilse, of the firm of Alvan Clark & Sons, of Cambridge, by whose mechanical skill much of the telescope was originally constructed; E. C. Slipher of the Lowell Observatory at Flagstaff, Ariz., an expert scientific photographer; and R. D. Eaglesfield of Indianapolis, a student in Amherst College, and es-

pecially well versed in practical electricity. By the courtesy of the firm at Iquique in charge of the interests of one of the great English nitrate companies, our observing station is established at Alianza, the largest oficina in the pampa, whose ample resources have been placed at our disposal by the resident manager, W. Brooke Comber. This gentleman has been unwearied in his efforts to promote not only the work of the expedition but the personal comfort of its members no less.

As long ago as the year 1263 the sun was said to have appeared as "a thin, bright ring"; and Sir David Brewster finds upon calculation that this annular eclipse occurred on August 5 of that year. Later times show many records of the solar annulus. In 1820, September 7, it was seen in Europe, and on May 26, 1854, a track extended from Ogdensburg to New York, good daguerreotypes of its several phases being obtained by Professor Alexander of Princeton. It is interesting to recall that it was during an annular eclipse in England. on May 15, 1836, that Baily first portrayed, in vivid fashion, the globules of brilliant light, like drops of sparkling water, which in his honor have been named Baily's Beads. His account, an elaborate discussion of the entire subject, is contained in the Memoirs of the Royal Astronomical Society for 1838. This odd and beautiful appearance, mentioned first by Holley in 1715, has been noted by subsequent eclipse observers for nearly two centuries; but the initial photographic portrayal was made in 1869 during the total eclipse visible at Ottumwa, Iowa.

Shadow bands, those singularly fitful lines of alternate darkness and light, not infrequently accompany annular eclipses. Always beautiful, elusive, the "visible wind" of early chronicles. they present a striking if unsolved problem.

The duration of the ring in these eclipses, as well as its width, varies within rather wide limits. Often old diagrams have given quite inaccurate ideas of the effect, showing perhaps a tiny black moon in the middle of a huge sun disk; whereas the greatest possible width of the ring is only about one-twentieth the sun's apparent diameter. So narrow, sometimes, is this brilliant ring of veritable sunlight, that many eclipses marked annular in almanacs barely escape being wholly total. Such, however, was not the case with to-day's eclipse—in which the annulus appeared considerably wider than its minimum.

Beginning well out in the Pacific. the track of July 10 averaged one hundred and seventy miles in width; between three and four thousand miles long, and ending in the middle of the southern Atlantic, it crossed South America with almost the exact centre of its curve. Striking the west coast about eight in the morning, the shadow path covered Iquique, the greatest nitrate port of the world, and other less important coast towns, before sweeping across the wide pampa, or desert, of Tarapacá, and the rampart of the Andes.

For a day or two weather conditions had been somewhat perturbed. Strong winds had suddenly begun, making a low-lying dust-haze along the foothills; early one morning a five minutes' shower, the first in three years, had greatly surprised the yellow surface of the pampa, changing its tint to a moist brown; an unusually long earthquake rumble had reminded the astronomer, with gratitude to his own forethought, that the precious telescope had been safely guyed against the very contingency which then seemed to threaten; and last evening, after a particularly gorgeous sunset, a soft bank of *camanchaca* rolled in from the west, soon hiding Mars and all the starry host, causing only the second impossible evening since our arrival. Prophecy failed in attempting to forecast the day, so that satisfaction arose to enthusiasm when this morning dawned in clearest brightness.

Over the mighty range of the snow-covered Cordilleras rose the sun. and the wide plain for countless leagues, out to the advance guard of the mountains, took on strangely opaline tints, in all its barren undulations. At five minutes after eight, first contact was observed, the black moon thereafter rapidly pushing its way over the brilliant disk until half, three-quarters, more, had disappeared. Photographs of the narrowing crescent were made, not only directly with the large telescope, but through a series of pin-hole apertures interesting photographs of crescents and annulus were taken by E. C. Bedwell. For a moment or two before the central phase, swiftly moving shadow-bands were observed by Dr. Guillermo Ghigliotto, S.; a quickly vanishing chain of Baily's Beads was noted telescopically by Mr. Comber and Professor Todd; and then, instead of an ethereal corona flashing forth in silvery radiance, a brilliant annulus of true sunlight held sway in the heavens, while observers behind disks looked in vain for the symmetrical streamers which, with a total eclipse at this time, might have been expected. A series of photographs was made of the delicate ring, and all four contacts were carefully observed, material which will be used by Prof. S. Newcomb in completing, for the Carnegie Institution, his life-long researches on the motion of the moon, with special reference to a determination of the exact centres of sun and moon.

Quickly the ring became narrower on the opposite side—another flashing glimpse of Baily's Beads, and a widening crescent grew momentarily in the clear sky, no longer sombre and forbidding, but joyously blue once more.

The crowd on the outskirts of the telescope enclosure has dispersed, records are being examined, negatives developed (thus far without any trace of the possible corona), and the usual calm of afternoon on the pampa has settled over its wide, brown spaces. To-night the telescope returns to its allegiance, Mars resumes first place in the astronomical economy, and the annular eclipse is of the past.

MABEL LOOMIS TODD.

Henry Holt & Co. announce as forthcoming "Guides for Vertebrate Dissection," by Prof. J. S. Kingsley of Tufts College; and "Darwinism To-day." by Prof. Vernon L. Kellogg of Stanford University.

Funk & Wagnalls announce the early publication of "The Semi-Insane and the Semi-Responsible," a translation by Dr. Smith Ely Jelliffe, of Prof. Joseph Grasset's "Demifous et demiresponsables"; and Dr. Densmore's "Sex Equality; A Solution of the Woman Problem." The theories advanced are based on the teachings of Darwin and Spencer.

Although books on medicine for the home are dangerous in the hands of amateur physicians, the "Dog's Medical Dictionary," by the well known English veterinarian Dr. A. J. Sewell, (New York: E. P. Dutton & Co.) is a valuable work for owners of dogs. It will be particularly useful for "first aid to the injured" and its notes for treatment of poisoning cases are exhaustive and clear. Owners of valuable dogs might at times use it with profit.

"The Nature and Origin of Life," by Felix Le Dantec, translated from the French by Stoddard Dewey (A. S. Barnes & Co) is a volume of surprising statements and theoretical conclusions. The author's object is to demonstrate that a living being is a mechanism and nothing more, and so very skilfully does he manipulate his literary colloids and diastases that when on the boundary of actual knowledge, he always finds some mysterious characteristic or combination of these substances ready to be conjured to his aid. Two sentences reveal his position in regard to important questions:

> We shall not therefore be astonished when we come to verify the marvellous phenomenon which governs the entire evolution of living beings: the heredity of acquired characters.
>
> A higher animal such as man is a mechanism of mechanisms of mechanisms.

In spite of the title of his book, Prof. Le Dantec systematically ignores the "origin" of life throughout. He concludes with these words:

> The problem of protoplasm synthesis remains what it was. But the time will come when methodic analysis will allow of a reasoned synthesis. When the effective synthesis is obtained, it will have no surprises in it—and it will be utterly useless. With the new knowledge acquired by science, the enlightened mind no longer needs to see the fabrication of protoplasm in order to be convinced of the absence of all essential difference and all absolute discontinuity between living and not-living matter.

The volume is worthy of philosophical consideration as advocating an unproved possibility, but the "light of new knowledge" will have to become much brighter than at present before one can pencil q. e. d. on the margins of many of the pages.

The sale of three diligently revised editions in less than a dozen years makes superfluous any extended notice of the fourth edition of Griffith's "Care of the Baby" (Philadelphia: W. B. Saunders Co.); the book has evidently found its place. The chief addition consists of an explanation of the principles of infant feeding, and directions for modifying milk in cases where the advice of a physician is not readily attainable. These directions also assume the presence of a very intelligent mother or nurse; for many families, some simpler scheme ought to be devised.

There seems no end to the strange diversity in habits of South American tree-frogs, and were the last account not vouched for by Dr. Emil A. Goeldi, director of the Para Museum, it might be used as an excellent example of a story by a "nature faker." This particular tree-frog, a species new to science, has aptly been named *Hyla resinifictrix*, and its habits are de-

scribed in the Proceedings of the London Zoölogical Society, for June, 1907. It is strikingly spotted, and banded with greenish-yellow, brown, and white; and it lives only in the tall trees of the virgin forest along the Amazon River. It makes its home in a cavity or hollowed-out branch, and little by little gathers the drops of aromatic resin which drip from the bark of the breo-brance tree, and with them thoroughly lines the cavity, making it water tight. The succeeding rains, instead of sinking into the decayed wood, form a permanent little pool in the tree top, and in this frog-made basin the eggs are laid. Here the tadpoles hatch and swim about and transform into perfect tree-frogs. They then go out into the world searching for a suitable place to form their own tiny lake.

The new British Antarctic Expedition, whose vessel, the Nimrod, of Newfoundland, 227 tons net register, has just sailed for New Zealand, is to establish its winter quarters on King Edward VII. Land. The party consists of twelve persons including its organizer, E. H. Shackleton, a surgeon, biologist, zoölogist, meteorologist, geologist and cartographer, with an equipment of twelve Siberian ponies, twenty-four dogs, and a motor-car. This has been specially constructed to run at very low temperatures, and will be provided with sets of runners for surfaces of varying softness; so there is a hope that the car will prove not merely a fanciful adjunct to the expedition. Though the main object is to reach the South Pole, explorations of the coast and into the interior of the supposed continental area will be made. After landing the shore party, Capt. England has instructions to carry a magnetic survey across the Indian Ocean, from Australia to the Mozambique Channel and up to Aden. If possible, soundings also will be taken along the edge of the continental shelf which is conjectured to exist off the patches of coast to the south of the Indian Ocean collectively described on the maps as Wilkes Land. Two other Antarctic expeditions are being organized, one by Dr. J. Charcot, to whom the French government has promised a grant of $120,000, and by M. Arctowski, who has already had experience in this region, having been a member of the scientific staff of the Belgica in 1897-9.

Drama.

Collected Works of Henrik Ibsen. Revised and edited by William Archer. Vol. X. New York: Charles Scribner's Sons. $1.

The adding of another volume, numbered the tenth, to the Scribner set of Ibsen's works, might be recorded in a few lines only, were it not that the publication of the revised translations of "Hedda Gabler" and "The Master Builder" has given the editor, William Archer, an opportunity to resume the search for "origins" of the plays as well as of characters contained in them. Much matter of actual interest in the two introductions is thus obscured by vain gossip as to whether this or that person, this or that piece of scandal, may have been instrumental in starting the current of ideas out of which finally grew the two plays.

Mr. Archer can hardly be reproached in this case, however. He is only following the example of one greater, from whom better judgment might be expected. George Brandes has furnished most of the facts and some of the mere rumors. To him it is owing that the dozen of rather insignificant notes written by Ibsen to a young German girl, then Fräulein Emilie Bardach, have been given to the public, together with a letter from Ibsen to himself, in which the playwright thanks the critic for his essay on "Goethe and Marianne von Willemer." This material serves Mr. Brandes as reason for more than insinuating an autumnal romance between the sexagenarian poet and his sixteen-year-old girl friend. And Mr. Archer uses the tempting gossip eagerly both for "Hedda Gabler" and for "The Master Builder." It is only just to add, however, that he conveys a small part of the interesting light shed on the entire affair by Dr. Julius Elias, the German executor of Ibsen's literary remains. But for that matter, the letters written by the playwright to the Viennese fräulein after their summer's friendship at the Tyrolean village of Gossensass tell the true story—tell it loudly between every two lines for anybody who cares to find the truth. There can be no doubt that Fräulein Bardach was studied eagerly by Ibsen, just as he studied scores of other women that came into his way with traits placing their characters outside the mere commonplace. And there can be as little doubt that she had the honor of furnishing some of the characteristics that serve to make Hilda so fatally attractive to old Solness, the builder of churches, of homes for men, and of castles in the air. Ibsen told Dr. Elias in so many words that he found two natures dwelling side by side in the young Austrian girl—two natures that seemed wholly incompatible with each other. That was the source of his interest in her. One of these natures prompted her to morbid coquetry, not with young men to whom she could become tied by lasting bonds, but with other women's husbands. To drag away a married man from his wife seemed to her the height of excitable "sport," Ibsen confided to Dr. Elias. At the same time she had much of a softer femininity, indicating that in spite of all she would probably some day (as actually has happened since then) make a good and faithful wife to a rather ordinary husband.

It was she who clung to Ibsen beyond the period his interest in her lasted. Gently but firmly he indicated in one brief and monotonously worded note after another that he had had enough of correspondence. At last he was compelled to tell her so in plain words, taking pains, however, to soften the blow by the addition of an ambiguous hint of regret on his part. Dr. Elias relates that about the same time Ibsen asked his wife to be kind enough to gather up whatever letters and photographs had been received from his persistent Viennese friend and to drop all of them in the wastepaper basket. His model wanted to become more than a model, and he resisted with that slight touch of peevishness that characterized him throughout life whenever anybody tried to break in on his artistic privacy.

Ibsen's reference in his letter to Brandes to Goethe's affair with Frau von Willemer is another story. "I may have read of it in Lewes long ago," he says, "but then I must have forgotten it, because the matter had no personal interest to me at the time. Now the case appears in a different light." Of course, Ibsen had not yet conceived "The Master Builder" when he read Lewes's "Life of Goethe." Having conceived the idea for that play, and emptied himself into the work, as was his wont, the similarity between the incident in Goethe's career and the rejuvenation of his own Solness by a belated love affair became at once "a personal matter" to him. If there be any assertion that can be made about Ibsen with complete safety, it is that he lived in his work, and that his work was his life. There he dreamed and loved, and suffered and failed and won. In ordinary life, he stood aloof, passive, reserved, a mere spectator, bent on seeing all and becoming involved in nothing. The sooner this fact is grasped, the sooner will the work of Ibsen be properly understood.

Music.

Joseph Joachim, the violinist, died at Berlin on August 15 after a long illness. He was born in 1831 at Kittsee, Hungary, the son of a merchant. Two years later his father moved to Budapest. None of the family had showed special aptitude for music, but when the boy was five he began picking out on a toy fiddle the tunes he had heard one of his sisters sing. He was then placed in care of the best violin teacher in Budapest, and at eight he made his début. In 1839 he went to Vienna where he became a pupil of Boehm and studied also at the Conservatoire. At twelve he was regarded as a full-fledged artist. He was taken to Leipzig, where Mendelssohn was so pleased with his playing that he offered to superintend Joachim's further education. Early in 1844 Mendelssohn sent him to London, where he appeared in the Drury Lane Theatre. Soon after he scored his first great triumph by playing the Beethoven Concerto at a Philharmonic concert. Returning to Leipzig, Joachim made that city his home for five years. He played in the Gewandhaus orchestra, and in 1849 he became leader of the grand duke's band at Weimar. While at Leipzig Joachim profited much from Liszt, especially in virtuosity. The modern movement in music, however, started by Liszt, and indeed the compositions of Liszt himself, were in the long run not congenial to the young violinist bred in the classical tradition. From 1854 to 1866 he was director of concerts at the court of Hanover. In 1868 he was made director of the High School for Music in Berlin. In that city he founded the famous quartet bearing his name. In 1877 the University of Cambridge conferred on him the degree of doctor of music; Glasgow made him an LL.D. ten years later; and Oxford followed the example of Cambridge in 1888. In 1899 the sixtieth jubilee of the violinist's first public appearance was celebrated in Berlin. An orchestra of two hundred musicians was gathered, all of the violins being his pupils who had come together from all parts of Europe. Not only as a player, but as a teacher and

founder of a system of violin technique, he won the highest repute. He was author of many compositions, but his greatest work is his Hungarian Concerto (op. 11) for violin and orchestra.

Admirers of Brahms are collecting a fund for building in Vienna a house which is to be a Brahms Museum. So far, $9,000 has been collected, but $5,000 more is needed to carry out the plans. Contributions may be sent to Dr. Erich Ritter von Hornbostel, Nibelungengasse 3, Vienna. The Brahms Society of that city has just issued a pamphlet reviewing its activity, with articles by Max Kalbeck and Julius Korngold.

Art.

THE SEVENTH INTERNATIONAL; VENICE.—II.

As for technic, a walk through the halls of the International reveals the rather stumbling eclecticism that is the most marked characteristic of the art of our times. There is nothing like a consensus of practice, every artist is a law unto himself. Most of them naturally feel the weakness of so isolated a position and betake themselves to Manet, to Whistler, to Puvis, to Monet, as their taste or vagary leads. The extremes are a blatant individualism such as one marks in a Mancini or a half-hearted discipleship such as one notes in perhaps two-thirds of the painting and sculpture in any great modern exhibition. A depressing sense of unreality pervades the Venetian as the other shows, because one moves not in the realm of achievement but of intention. Where there is no craftsmanship it is impossible that there should be art, and fine craftsmanship, which for three centuries was almost the rule in Europe, has come to be painfully the exception. One may study, however, in the present show the widening and, we believe, the dying ripples of that form of impression called *pointillisme*. Virtually dead in France, where it originated, partly repudiated by its inventor, Claude Monet, it is running a vigorous course in Italy, Germany, Belgium, and Russia. The Belgian Van Rysselberge, in the striking group of male portraits, Homage to the Poet Verhaeren even achieves the *tour de force* of a lamplit interior in iridescent dots. Only one or two of the Russians seem to me to draw much profit from the formula. I recall with keen pleasure Igor Grabar's extraordinary arabesque of iceladen willow twigs. In general this kind of impressionism seems to rest on a valid analysis of the effect of pigment, but unhappily also on a vicious use of the brush. A little study of such colorists as Veronese, Tiepolo, or Fragonard, not to mention Velasquez, would show that the *pointilliste* effects are compatible with a suave and generous handling. In fine, success in this technic seems to come not through, but in spite of the niggling which happened to be Monet's approach to atmospheric reality. If impressionism shall have served to clear up the muddy academic palette, it will not have come in vain, but even here its triumph is doubtful. The love of full vibrant color seems exceptional, and there is a pretty general tendeucy to take refuge in a tonality that approaches monochrome. This gain there is at least that the old waxy methods of the studios have fallen into general disfavor. There is abundant evidence of keen and loving observation of natural appearances, what is lacking is reflection and a workmanlike perception of the possibilities of oil colors on canvas.

Perhaps I should apologize for applying with undue iteration to the Venice International of this year a criticism that is true of every exhibition of painting for a half century past. In any case, I must no longer remain in generalities. In passing through the Italian halls one will be less impressed probably by the individual exhibits than by the interesting provincial flavor of certain displays. One finds the Piedmoutese, for example, following in the footsteps of Segantini in essaying their own Alpine panoramas. Maggi and Fornara do this with much taste, the defect lying in a certain inertness of contour. The Venetians, as if in loyalty to the memory of Canaletto and Guardi, preserve a certain level of taste, as shown in harmonious tonality. I find nothing of a remarkable sort in this section, though the contributions of Laurenti, Bezzi, Emma Ciardi, and Favai seem of a superior kind, but the school as a whole is evidently incapable of the flagrant eccentricities and vulgarities that mar the Italian section generally. Of the galleries representing Rome, Florence, Bologna, Milan, and Southern Italy, nothing can be said except that they reinforce the tedious lesson that the painter and sculptor may become an artist only by first qualifying as a craftsman. The confusion of counsels that afflicts modern art generally is here at its height.

To pass from the Italian galleries into the Russian exhibit, is like rushing from the tepidarium of a Turkish bath into the teeth of a nor'wester. There is an exuberant inventiveness about these Slavs that carries a wearied gazer quite off his feet. No more thrice-told tales here, no more mutual admiration societies, but a group of confident, restless spirits, grappling with the witness of its eyes and the difficulty of the medium; and conducting the fight with barbaric zest. What is Boris Kustodieff's Family Group (No. 19) except a Whitmanian yawp in paint, a glorification of the red Russian blood that courses in the good Russian air? His portraits of Counts Ignatieff and Witte, the latter a pastel, display his talent in a more conventional but still invigorating phase. Or take Seroff's portrait of the Painter Korovin, lolling in shirt-sleeved ease on a crimson striped cushion. How apparitional it is! a raw bit of life, but emphasized until it becomes significant. Space fails me to speak of Golovin's sketches for stage settings, of Ulianoff's Actress, seen through the eyes of Manet and Beardsley, but extraordinarily real, too; of Repin's sterling portraits; of the Sculpture of Steletzkz, and of Sudbinin, who presents a Rodinesque Gorky, but is better seen in the grotesques of the "Arte del Sogno." Grabar's fanciful landscapes have already been mentioned, and if only for the sake of record one must note Malavin's peasant girls, whose gowns are a perfect cascade of crudely dazzling local color. This is the old Slavic style, which seems to be giving way to more refined extravagances learned at Paris. It would be easy to exaggerate the worth of this incipient Russian art; it is so refreshing in the generally stale atmosphere of the show, it reveals so strongly the charm of archaic endeavor. All one can safely say is that it is an unspoiled art, that its borrowings are made for the sake of expressing something, and that its energy seems drawn from a true relish for natural appearances and its own dreams. It seems as if such an art might go far, but that we shall know better when it has passed out of the boisterous, adolescent stage.

Germany, England, France, Austria, and Belgium, among the foreign nations exhibiting, have arranged and decorated especial halls. The other countries either stand by former schemes, or are relegated to the international galleries. Thus the American exhibit is wholly lost. A pair of big canvases by Melchers, two vigorous studies by Augustus Koopman, three interiors by Richard Miller, comparatively a newcomer, who renovates skilfully the manner of Alfred Stevens, about completes the list. Mr. Sargent, we have noted, is shown with the English; the veteran etcher, Joseph Pennell, who exhibits, besides the remarkable panoramas of Rocamadour and Paris, a selection from the classic London series, is also reckoned as a Briton; while even the young American etcher, Ernest Roth, who sends two interesting Venetian subjects, is credited to Germany. Since Pennell has sold to the Municipality of Venice, and Roth to the Queen Mother, one may hope that these compliments at least may be transferred to a nation that in the present show sadly needs them. Some day we hope that an American committee will provide a really representative show at Venice. The attempt has been made, I believe, but under auspices unduly favorable to the product of our cosmopolitan or denationalized fellow countrymen.

A survey of the specially decorated halls and their contents need not long delay us. For England, Brangwyn has provided mural panels depicting labor in London and in Venice. The color is a leaden monochrome; the design is rather stupidly calligraphic. This gifted painter seems to have sunk into a lifeless formula, and yet it seems only yesterday that his fresh invention and barbaric color were carrying us off our feet. Good Laverys and bad ones, a Peppercorn marine, two spirited but rather painty canvases by Alfred East, are about all that one recalls in the English room. But Orpen shows in the first international gallery a half-clothed Spanish girl, which, if a bit brutal in mood, is uncommonly well painted.

A glance at the French display is enough. Carolus Duran is there in a perfunctory nude and in an admirable male portrait that recalls his better times. Besnard is empty and pretentious in the full-length portrait of Ambassador Barrère; Cottet's manner—he sends a view of Avila, a marine, and a portrait—becomes more lugubrious than ever; Gaston La Touche seems more factitious than before if that were possible; Sidaner, Signac, Ménard repeat themselves wearily. A group of Fantin's saves the show, though the sturdy academic merits of Laurens (portraits of his parents) and Dinet (Eastern Bathers) are positively edifying in this assemblage of

restless individualism. As much may be said of Lucien Simon's group which has been lent by the Luxembourg. In this company the golden mediocrity of Jacques Blanche fairly imposes itself as great painting, which emphatically it is not. It is, however, the product of a fine taste and of a discretion that perceives justly the limitations of the palette in relation to a given subject. In this sense it is highly workmanlike even if it does not attain to bold or exquisite craftsmanship. Here we have the much discussed Cherubino, and two female portraits, notably one in a strange mauve gown that seems impossibly difficult. In every case, excepting the highly sentimentalized page of Beaumarchais, the picture ought to be dull but someway escapes that abyss, which argues a high degree of taste and discrimination in the painter. In the single contribution of the engraver Lepère, one feels a greater spontaneity. Indeed, no landscape in the show has moved me more deeply than this romantic Sunset. A great buff cloud towers above a low brown hilltop, and out of the cloud the wide rays of the disappearing sun rake the moorland. The centre of the picture is dazzling, but to the right in the gloom one discerns a group of gypsies about a fire, while to the left a stretch of cool seacoast leads back again to the sky. Everything is of the simplest, the sentiment is fairly naïve, but what a sense of the surge of cloud and the movement of landscape. The habit of seeing these significant things and transferring them to the block or copper, has plainly been a useful training for this broader work.

The Belgian Government has put up a low-gabled stucco pavilion, containing four galleries besides the vestibule. There a fountain in yellow marble trickles invitingly. The halls are light in tone, with new art stencilings. Rectangular columns and pilasters, that support nothing, abound. The occasional patterns in friezes and elsewhere are based neither on nature nor on geometry. The painting of the façade on Emile Fabry's cartoons represents a revived Flaxmanism. A sense for simplicity and tastefulness has guided the work, but the endeavor has failed through the desire for novelty. However, this ineffectual bit of new art at least provides excellent galleries, and no nation is so generously housed as the Belgians. To be sure, there is nothing so good inside as the plasters of Meunier's Sower and Miner, which stand outside; but one finds Evenepoel and Baertson within; Rysselberghe's astonishingly well-drawn but unrestful portrait group; three beautiful studies of Bruges, practically in monochrome, by Fernand Knopff, which attain distinction by the most usual means; and a retrospective display of prints and drawings by that great technician and perverted talent, Felicien Rops.

The hall devoted to the art of the Dream needs only a warning not to take it seriously. A fair Anglada, a poorish Prometheus by Walter Crane, a cheaply hideous Salome by Franz Stuck—these, with a sprinkling of German, French, and Italian primitivisms and eccentricities, are the stuff out of which dreams are made. On the benches lie the Russian Sudbinin's bronzes, attractively horrible, like blobs of molten metal settling down into caricatures of the founder who has let them fall. These beautifully patined monsters belong to the art of the nightmare, and do much to justify an otherwise dull display. For, through some lack of dreaminess perhaps, I find even Tofanari's agreeable conceit of the giant hands of the Divinity squeezing the blood out of a writhing mass of miniature humans, less disgusting than merely dull. To shriek beyond the audible scale is the same as to remain silent.

If pale walls could blush, those of the hall decorated by the Vienna Hagenbund and the Manes of Prague would certainly do so. No one enters this silvery room without an exclamation of applause. It is all in a grayish white with slight decoration in a greenish gray. The pictures, which are frankly not much, are uniformly framed in narrow silver mouldings smoothly rounded. A touch of coral in the furniture is the only color. In so exquisite a place the official brass numbers have seemed amiss, so the committee has painted the figures on the wall under the pictures in the gray of the decoration. Small gray mats carry the tint over the floor. To an amateur of this sort of thing, the most interesting feature of the room is the velarium of plain muslin which is stretched at the height of the frieze. This cuts off entirely the cove and cupola, imprisoning a great amount of light between the glass and cloth and diffusing it delightfully through the hall. No gallery is so light. At all times the adjoining halls seemed fairly sombre, and during the gloom of a thunder squall the Austrian secessionists still were irradiated. I confess that the key seemed too shrill and insubstantial for oil paintings, but I can imagine nothing more charming for prints or drawings. The low velarium, too, should be a valuable device in ill-lighted galleries.

No space is left for sculpture, which, with Rodin's great Penseur in the lead, is of superior average quality to the painting, nor for black and white, in which Brangwyn, Zilcken (in large and cold Venetian plates) are prominent, while Legros, in two magnificent sepia drawings touched with color, lords it supreme. But any account of the International would be incomplete without a counsel to go to the Palazzo Pesaro and see the modern paintings that through gift or purchase the city of Venice has culled out from the six preceding exhibitions. There are Zuloaga and Sorolla in splendid examples, Cottet and Brangwyn before they had gone off, Knopff and Liebermann, Zorn and Lucien Simon, Gravesande and Whistler are there to represent etching. Rodin looms large in a full-sized cast of the Burghers of Calais. Such an excursion will do much to offset the inevitable impression of mediocrity gained at the current show. Exhibitions like nations are saved by their remnants, and the remnant that remaineth from half a dozen Internationals at Venice is more impressive than any yearly chronicler would have believed.

M.

By arrangement with British publishers, A. C. McClurg & Co. will bring out in this country "Thomas Gainsborough," by William D. Bolton; "How to Identify Old Chinese Porcelain," by Mrs. Willoughby Hodgson; and "Old Oak Furniture," by Fred Roe.

George Robertson & Co. of Melbourne have in preparation a comprehensive work, "Australian Architecture," by a leading Victorian architect. It will probably appear in November. The climatic conditions of Australia have developed several new architectural types and many varieties, such as should attract the attention of those Americans who are ever in search of new ideas.

A much damaged fresco, by Gianfrancesco Caroto, representing the Annunciation, has been discovered in the Oratorio of S. Girolamo at Verona, and is reproduced in the *Bollettino d'Arte* for July. This dignified composition, dated 1507, is the earliest known work of this painter. The same number reports the recovery from a parish church of a series of fine wall paintings by Sebastiano Ricci. These depict the life of Moses and were origiually made for the church of SS. Cosmo and Damiano, on the Giudecca. They are now destined for exhibition in the Accadémia, Venice. Unquestionably many other works of importance distributed to remote parishes during the Napoleonic régime may similarly be reclaimed in the Veneto. The authorities of the Uffizi have promoted from the storeroom to the galleries a remarkable Madonna with the Christchild and St. John, in which Pontormo appears in his most intimate and affecting mood. Besides the usual news of restorations, the present issue contains an elaborate and apparently exhaustive bibliography of Herculaneum, by Ettore Gabrici.

The dowager Countess de Mérode has at last allowed the famous triptych of the Annunciation to be exhibited at the Golden Fleece exposition in Bruges. This picture is the starting-point of a peculiar bit of reconstitution in art history, something like Wolff's effort in Homeric criticism, or the higher criticism of the book of Isaiah. In 1887 Bode of Berlin proposed that a certain number of paintings in Brussels, London, Berlin, and Madrid, should be provisionally attributed to an unknown master, whose typical work would be this Mérode triptych. He was to be known as the Mousetrap Master, because in the triptych St. Joseph is represented making such traps, with one hanging as a sign at the door of his carpenter's shop. The pictures and literature of the unknown master increased with the years, until, in 1902, he found a name at the exposition of Primitives at Bruges. It was then proposed to identify him with a painter of Tournai of the fifteenth century, a certain Jacques Daret; and now a book has been written about him, under that name, by Maurice Houtard. It seems there was such a painter, who studied at the same time with Van der Weyden. They began their apprenticeship the same year (1427). In 1468, at Bruges, Daret was charged with the decoration of the city for the marriage of Charles le Téméraire and Margaret of York; and he worked seventy-eight days, there being no further mention of him anywhere. Unfortunately, not one of the pictures of unknown masters appears in the scant records we have of Daret's existence. And now there is a quite new Flemish critic who is going to "prove" that the Mérode Annunciation is, after all, the work of Hubert Van Eyck. Luckily, all this threat of endless literature does not pre-

vent the painting being one of the best examples of the masters of the Primltive school.

A commission of experts has been appointed, of which Comm. Boni and Prof. Corrado Ricci form part, to draw up a project for continuing excavations beneath the foundations of the Palazzo Fiano. Here, about four years ago, the excavation was begun of the Ara Pacis, or Altar of Peace, one of the finest monuments of Roman art, decorative fragments of which have been found scattered in the Palazzo Fiano, the Vatican, the Villa Medici, the Uffizi, the Louvre, and in Vienna. The work of excavation was naturally one of great difficulty and expense, as the foundations of the Palazzo Fiano had to be safeguarded and water to be pumped out. Want of funds prevented the conclusion of the work. It has been estimated that £6,000 will be required to complete the undertaking, which involves the expropriation of the site. The present commission will make an effort to induce the commune of Rome to assist financially, so that this important work may be resumed next autumn.

In Austria the year 1908 is to be marked by a noteworthy art exhibition, in honor of the sixtieth anniversary of the reign of the present Emperor. In Vienna an association of artists, sculptors, and others has been effected to arrange for this exhibition, which is to include only pictures and other specimens of art that were created during these six decades.

From Paris comes news of the death of Adrien Jourdeuil, at the age of sixty. He was born in St. Petersburg, the son of French parents, and he studied under Bouguereau, Bonnat, and Tony Robert Fleury. For many years he had exhibited landscapes at the Salon; and he won medals in 1888, 1889, 1894, and 1900.

Finance.

THE MONEY MARKET DISTURBANCES.

In its fundamentals, the character of the present financial disturbances has been understood during many months; it was fairly summed up in this column a month ago, in a review of the diagnosis of M. Leroy-Beaulieu. The conclusion of that eminent economist was that the whole world was suffering because demands on capital by industry and speculation had become greater than the actual available supplies; that credit pure and simple had been carried as far as was prudent under such circumstances; and that the present halt in the forward movement, the present high money rates, and the present financial stress in the process of readjustment, were the inevitable result of an effort to bring supply and demand of capital to an equilibrium. In this diagnosis, practically all experienced financiers, on the world's great markets, now concur.

It was not until the present month, however, that the practical results of this process, pursued on all the markets of the world, began to show themselves. As a rule, a strain of this sort in the international money market does not exhibit its full effect until September or October, for the reason that in those months the gathering and moving of the great cereal harvests call peremptorily for large sums which, earlier, have either been lying idle or have been applied to other temporary uses. It would naturally follow that when this legitimate demand arises, and when the capital needed for the harvest country is withdrawn from other quarters of investment, the scarcity of capital and the consequent inability of less deserving borrowers to obtain the credits needed to sustain their own position, would disclose themselves definitely. In the present year —somewhat to the surprise of the financial world—this particular strain has begun in advance of harvest demands. Its occurrence in August is unusual; August is traditionally a period of dulness and inactivity in financial markets. Indeed, on numerous occasions recently, as in 1906 and in 1905, that month's events on the New York money market have not only given little clue to the grave disturbances which were to follow later, but have been misleading regarding the immediate future. This year, for the first time since 1890, the month—especially in the past week—has been characterized by alarming disturbances. Presumably, this early unsettlement has been due to the effort of all the markets to prepare for and anticipate the more serious strain expected in the autumn. To this extent the early occurrence may be described as reassuring.

Three incidents of last week may be taken as typical, each in its own field, of the general situation. On Wednesday, the Pope Manufacturing Company, an automobile and bicycle manufactory, with $21,000,000 capital stock, went into the hands of receivers. On Thursday, the Bank of England advanced its official rate from 4 to 4½ per cent. On Saturday, the New York Associated banks published a weekly statement, showing reduction in the loan account of $14,000,000 for the week—a total reduction of no less than $30,000,000 since the opening of August. A few words of explanation may make clear the exact significance of these three happenings.

The failure of the Pope Company, which at first excited acute alarm on the money market, was by no means a disaster of the type which produced confusion in the panic of 1893—a time when absolute wreck of confidence deprived of proper credit facilities dozens of normally solvent corporations, and dragged down both them and their creditors in a common ruin. A nearer analogy to this failure will be found in those overcapitalized and ill-organized industrial concerns which came to grief in 1903—bankruptcies which left no permanent mark on our fabric of credit. All that need be said at present is that the company in question, while its constituent manufactories enjoyed high prestige as industrial enterprises, was so grossly overcapitalized that it was driven, in order to conduct its trade, to repeated recourse to the money market under most disadvantageous circumstances. Companies thus equipped financially are necessarily victims of the first season of real stringency; but their downfall may, as in 1903, occur without any serious sequel.

The case of the Bank of England is in some respects peculiar. The 4½ per cent. rate of last Thursday is the highest ever fixed by that institution in the middle of August, since London's year of extreme unsettlement of credit, 1890. It compares with the rate of only 3½ per cent. a year ago—followed in the autumn by the 6 per cent. rate destined to be long remembered as the real signal of international strain on capital. The 4½ per cent. rate must therefore be described as abnormally high for the season. Furthermore, last Thursday's rate had not been in force four days before Lombard Street's private discount had advanced to 4⅞—a movement assumed by many observers to indicate a further rise in the London bank rate this present week. Yet, last week's rise in the rate was no response to a weak condition of the Bank itself. Percentage of reserves to liabilities was 50⅝, which is not only 10 per cent. above the traditional minimum, but is far above the average at this date in the past half-dozen years. The London market's explanation of the movement is that the Bank had found itself compelled to resort to drastic protective measures, with a view to preventing further extensive withdrawals of London capital and gold for the two unsettled money markets of Berlin and New York. On Saturday this action of the Bank

No. 59 Wall Street, New York

was followed by great uneasiness on the part of London private bankers, in the course of which decided measures had to be taken to avert a foolish sacrifice of credit.

The enormous loan reduction shown in last Saturday's bank return of New York city was, on the other hand, a sign that the process of forced liquidation had been effective in accomplishing exactly the end which had made it necessary. Confronted, as the market was not many weeks ago, with conditions in which the inadequate supplies of capital and credit were plain to every one, in which Stock Exchange values, though largely reduced from the level of a year ago, were still fairly high, and in which the withdrawal of cash reserves for harvest uses was imminent, the quickest and the most obvious measure of relief was reduction in loans and liabilities of the banks through heavy liquidation on the Stock Exchange. To put the matter simply: institutions and individuals, with money tied up in stocks at existing valuations, withdrew their capital through the sale of these holdings on the Stock Exchange, thereby equipping themselves with the ready capital for such other needs as were certain to arise. Naturally, the Stock Exchange has complained bitterly, Wall Street particularly devoting itself to explanations that no liquidation of the sort would have been necessary but for the baleful activities of Mr. Roosevelt. To the thoughtful man, it should be manifest enough, from the facts just reviewed, that the movement of liquidation was inevitable under any circumstances.

What, then, are we to say is the net result of this first week of trial in the strain of the autumn markets? The Pope insolvency has proved that ill-equipped corporations will have no comfortable time while the storm passes over; but the reassuring fact in that direction is, that since the warning of 1903, companies of this kind have devoted themselves in the main to putting their house in order, and have been enabled to do so through the great prosperity of the three ensuing years. The attitude of the Bank of England seems to indicate that the real embarrassment will not converge exclusively, and may not fall most heavily, on New York. By reason of the extravagant credit inflation of a year ago, the American market has been pictured as the conspicuous mark for financial lightning. This view was in most respects correct; it ignored, however, the enormous tangible resources of this country, which, if properly utilized, will go far to sustain the impending strain; whereas London, in so far as it, too, was bound to suffer from the lack the credit, was weakened by the fact that it had not in the past few years been able fully to make good its own losses incurred in the Transvaal war. The New York bank return, finally, showed that thus far, at any rate, American institutions have been following the line of safety. Of them it may be said, as indeed it may be said of the Bank of England's action of last Thursday, that the mere fact of such drastic action, at so unusually early a date, gives distinct assurance that such troubles as the autumn may have in store will at all events have been prepared for.

The Nation.

NEW YORK, THURSDAY, AUGUST 29, 1907.

The Week.

In his speech at Chautauqua on Saturday, Gov. Hughes spoke in his usual calm way. It was, however, a distinct programme of political activity which the Governor laid down. He is a thorough believer in reform and progress. To be conservative in the sense of refusing to do anything is no longer possible. Yet stability is necessary, and it is the peculiar merit of Mr. Hughes's speech that he sketched an ideal of advancement which shall be steady. When he dwelt upon the duty of public men to assert reason in the face of popular emotion and prejudice, to mark out a rational goal, and then press toward it without haste or rest, his hearers must have felt that he was the embodiment of his own doctrine. Without clamor or any kind of meteoric flashings about the firmament, he has indicated useful lines of public progress, and has steadily pursued them. His success has not been absolute, but has been very great. And it has been due largely to his method of persistent appeal to reason, rather than resorting to impetuous mouthings addressed to vague passion. If Gov. Hughes is more successful than President Roosevelt in hitting off the popular need just now, it is because he gives the impression of being a progressive man who does not lose his head or give rash rein to his tongue. There is a distinct place for a public man who can advocate reforms without foaming at the mouth, and secure them without destroying those necessary and precious things—confidence, a sense of security, the quiet ongoing of industry.

The season of the "straw-vote" begins at about the time the grain crops are harvested, a coincidence which it takes a rustic philosopher to explain. The most notable example thus far is the poll taken by the Chicago *Tribune*. This canvass, the result of which has been received with such delight by the friends of Secretary Taft, has recorded the preferences of 1,634 "Republican editors, legislators, and other political leaders in the Middle West." The absolute preferences in any unofficial count of this kind are not to be taken too seriously. At the same time, there are some points in the table which indicate peculiar and perhaps unexpected tendencies among Republicans. In the first place, while Taft has a marked lead over all others as first choice for the Presidential nomination, Hughes is the most popular second choice and also third choice in the Middle West. The Republicans in every one of the seven Taft States included in this poll have Hughes in mind as the next best thing to the President's own candidate. Wisconsin, with a favorite son for the first place, puts Hughes in second, while Illinois and Indiana, also with favorite sons, have Taft second and Hughes third. Still more remarkable is the discovery contained in the two general questions addressed to the participants in the poll. Only sixty-five answer "No" to the question, "Do you approve the progressive policies of the President?" When the *Tribune* asked, however, "Do you prefer a progressive or a conservative for his successor?" no less than 176, or two and a half times as many, replied, "Conservative."

Secretary Taft spoke to the people of Oklahoma Saturday in the rôle of an individual citizen who, if he lived in their community, would certainly vote against the new Constitution, and, by the same token, for the Republican ticket. His words are entitled to praise by contrast with those of the politicians of his party who have been for throwing out the new State, willy-nilly, ever since it appeared that it was certainly Democratic. But what are Mr. Taft's reasons for opposing the drafted Constitution? Various points he made against the anti-injunction clause, the multiplicity of offices, and the inadequate provision for schools. But the fact which he emphasized, according to the reports, was the existence of a Democratic gerrymander. He denounced the "hypocrisy" of the men who, in the sacred name of popular sovereignty, had "by the merest political trickery and chicanery adopted a plan by which there might be a majority of ten thousand for the Republican ticket in the State, and yet there would be a Democratic Legislature and Democratic Senators." Of course, Secretary Taft comes from a State where no such thing as political trickery has been heard of in the memory of man, and he is naturally shocked to find it rampant in Oklahoma. Yet we could name another State in which the chief city might have over half the voters, and every one of those voters cast a Democratic ballot, and yet the Republican party, under the State's extraordinary Constitution, would still have a majority in the State Senate, if it carried the rest of the State by the barest majorities. That State happens to be the home of the President, who has to determine "judicially" whether the Oklahoman Constitution conforms to that of the United States. It is one more proof of the difficulty of throwing a brick at Oklahoma without hitting some sister State.

Mr. Bryan is much pleased at being singled out by Secretary Taft for comparison with President Roosevelt. He announces that he will take up his old charge, that Roosevelt stole his clothes, and will have something interesting to say about it. Meanwhile, he emits a loud note about the dangerous "centralization" of the President's Provincetown speech. The plan of Federal incorporation is alarming to Mr. Bryan; it could work out only to the crippling of the States and the profit of the railroads. But all such protests come with exceeding ill-grace from a man who has advocated the Government ownership of the railroads. That should have forever closed his mouth about centralization. For Mr. Bryan to raise that cry against Mr. Roosevelt is for a man in the water up to his armpits to rail at one who is wetting his ankles.

Judge Parker's presidential address before the American Bar Association at Portland, Monday, touched upon the duties of lawyers as citizens. The burden of his remarks on this subject was that lawyers should realize more keenly their extra-professional obligations. It is their business as citizens, he argued, to cling to and defend sound principles of government and of public policy. In a phrase which is a favorite with Gov. Hughes, Judge Parker urged his brethren at the bar to stand for reason as against passion. That there are difficulties and even perils in such a course, he did not deny. He pointed out the new forms of intimidation and hounding which nowadays waylay the man who asserts what he thoroughly believes to be right and true, in the face of intense popular prejudice. Demagogues will denounce him; the yellow press will cartoon him; an insensate outcry will be raised against him. To withstand or defy this modern style of public terrorism, requires a fine type of civic courage. All the greater the demand, then, for men who will despise the swords of our latter-day Catilines. That there is peculiar fitness in calling upon lawyers to apply themselves to the correction of public abuses is clear when one notes their numbers and prominence in all parts of the government. In Legislatures and in Congress, they are more numerous than any other class. If our lawyers would only stand together, they could put an end to many an evil. For the plague of overlegislation, to which Judge Parker alluded, lawyer-legislators are more directly responsible than anybody else.

There is, however, a disrepute much more marked and peculiar attaching to-day to the legal profession, in the popular mind. We refer, of course, to the special relations of "eminent counsel" to the great corporations which wish to keep on the shady side of the law, and which retain lawyers, at enormous salaries, to advise them, not what the law is, but how it may be violated with impunity. It is lawyers of this kind who are more and more awaking popular suspicion of their whole class. To "hang all the lawyers" has been the first item in the programme of more than one people's rebellion; and if something of that sentiment is astir in this country to-day, the lawyers have themselves to blame for it. There ought to be some way of disciplining professionally lawyers who prostitute their talents in the service of corporations whose money-making depends upon "getting around" the criminal law.

There is now little doubt that the Interborough-Metropolitan directors are striving to repudiate the dividend guarantee on the Metropolitan Street Railway. Their reported plan of procedure is to throw into bankruptcy the New York City Railway, which owns the street railway company and directly guarantees its dividend, and which is itself owned, through an intermediary company, by the Interborough-Metropolitan holding company. As to the practicability of this scheme, we have our doubts; the courts have heretofore ruled, in leading cases, that one corporation which controls another, through ownership of its stock, incurs in law the duties and responsibilities resting on the company thus controlled. Any other interpretation of the law would, apparently, play directly into the hands of designing financiers who should acquire control of a company in order to appropriate its assets, wreck it, and buy it in for a song on foreclosure. But whatever may be the legal aspect of this expedient, we are certain that the people, the courts, and the Public Service Commission ought to hold the responsible parties to the strictest accounting. The Interborough directors, who, in last year's extraordinary "merger," sold their birthright for a mess of pottage, deserve almost as little sympathy as the conspirators and plunderers who brought the enormously lucrative New York Street Railway enterprise into its present condition of virtual insolvency. Some of the perpetrators of this financial infamy are dead; others are still within reach, and it will be a matter for regret if, now that their schemes must be brought before the courts, the full measure of justice is not meted out to them. The scandal is of nearly a decade's duration; the ingenuity of corporation lawyers and the influence of important banking interests have been successfully invoked, on repeated occasions, to shelter the guilty parties and to fasten their hold upon the property. If half the allegations made in well-informed quarters of the markets are true, the situation is one for criminal quite as much as for civil jurisdiction. We sincerely trust that the day of reckoning is near at hand for the gentlemen whose plots reached their climax in the insolent requirement that their shareholders "vote for the lease first, and discuss it afterward."

Everybody must have noticed that, as the interest rate has risen, talk about municipal ownership has subsided. Last week's decision to offer New York city bonds at 4½ per cent. was fairly forced upon our financial authorities. With 4 per cent. bonds selling at 96 on the Exchange, it was vain to try to dispose of more of them at par; and the city has simply been compelled to do what other borrowers have done—that is, pay the market price for money. Even at the new rate of interest, it cannot properly be said that the city's credit is impaired, as compared with that of other municipalities. Boston has been unable to place bonds at 4 per cent.; English cities have found themselves in the same difficulty. In Germany, municipal loans have fallen sharply in the market. Recent issues have, like those of New York, been marked up one-half per cent.; Berlin is now, we believe, obliged to pay 4½ per cent. New York, therefore, is not discriminated against. Probably no city could now float any considerable issue of 4 per cent. bonds at par. But this merely financial aspect of the new level of New York loans is not so interesting as its bearing upon mooted questions of public policy. The whole agitation for municipal ownership of gas, electricity, and transportation has gone upon the assumption that this city and others could borrow money indefinitely at 3 or 3½ per cent. That was one reason why municipal operation was to be so much more successful than private management. Cautious people pointed out all along that this financial premise might prove any day to be untrustworthy; and that, in the ups and downs of interest rates, the city might have to pay much more for money. That objection was, of course, brushed aside as contemptuously as all others; but here we are already having to pay 4½ per cent. Fancy what our plight would be to-day if we had gloriously set out in 1905 to acquire all our public utilities on a basis of 3½ per cent. for city bonds. Our "margin" would be depleted by about 30 per cent. It is an old question, which has never been answered: "Who will pay the bills of Socialism?" A new form of it suggests itself to-day with unpleasant force: "Who will buy the bonds of municipal ownership?" All theoretical and political considerations aside, the financial argument against such ventures has been powerfully reinforced by the course of events.

Secretary Cortelyou's plan of gradually depositing Treasury funds with banks, during several weeks, seems well considered and promising. It approximates, so far as our cumbrous fiscal system permits, the practice of other Governments. None of them pursues the tactics of locking up surplus receipts, until a nuge sum is first taken from the market that needs it, and then hangs over the financial world as a sort of combined terror and hope. Former Secretaries have permitted these large and unused accumulations in the Treasury, until a crop-moving demand or some other became acute, and then have been besought to come to the rescue all at once with millions of money put out in a lump. This system has been vicious in several respects. It has strengthened the mistaken conception of the Federal Treasury, as a kind of good uncle to whom bankers may run when in difficulties; and has also often made matters worse, instead of better, by heightening speculation, or facilitating the export of gold at the very time it is most needed at home. It certainly seems as if the method of quietly letting the surplus out in driblets would largely avoid these evils. It is giving the patient stimulants in light and successive doses, instead of waiting till he is in a state of collapse, and then pouring an entire bottle of brandy down his throat. At the same time, the Secretary's discretion remains unimpaired. He can suspend or enlarge his deposits at will; and if a great emergency arises, he would have a free hand to meet it. The Government ought to be entirely out of the money market, and Mr. Cortelyou's plan is commendable as an attempt to take it out as much as our unbusinesslike system will allow.

In agreeing to refer the Newfoundland fisheries dispute for adjudication to the International Tribunal at The Hague, the State Department and the British Foreign Office have hit upon a solution of this long-vexed question which commends itself from more than one point of view. An authoritative juristic decision upon the essential point involved—whether a government may indirectly supersede the provisions of a treaty dealing with the rights of aliens by enacting legislation inconsistent with the observance of the treaty, but justified on the grounds that it applies to citizens and aliens alike—would be of great use in future cases of the kind. In the specific instance, it is probable that the Newfoundlanders will

reconcile themselves more readily to a verdict by so high a tribunal as the Hague Court, than to any disposal made of their interests by the British Government. It is notorious that Mr. Bond's islanders regard the British Foreign Office with distrust because of its presumed readiness to sacrifice colonial interests to Imperial considerations. It is not likely, for instance, that any judgment of the Hague Tribunal could lead to such bitterness of feeling as followed the outcome of the Alaskan Boundary Arbitration arrangement with Canada.

Definite information concerning the nature of the American proposals for obligatory arbitration at The Hague is beginning to come in. At first sight, there is little to stir the friend of international peace to ecstasy in the list of subjects under controversy which the proposed treaty would submit for the consideration of the enlarged and permanent Arbitration Court. The horrors of war seem but remotely connected with "the measurement of ships, the international protection of workingmen, means to prevent collisions at sea, or reciprocal free assistance for poor patients." Yet among the enumerated contingencies are to be found more important matters, such as "the right of foreigners to buy and possess property," a clause which, liberally interpreted, could be made to include the entire class of vexing questions arising from the activity of foreign concessionaries in the various South American republics. Further than this, however, there is the blanket clause which assigns to the permanent court jurisdiction in all cases "regarding differences of an international character between sovereign states which cannot be settled by diplomacy." We miss the familiar and safe qualification, "except those involving the national honor or integrity." Should the proviso be omitted from the full text of the treaty as it is from the cabled summary, it would mean that the great Powers have imposed another restraint upon precipitate action, and given an additional hostage to public opinion. The small nations would probably be forced to submit their grievances to the court; and such is the force of imitation that the big fellows intent on making the little ones behave might fall into the habit themselves.

The reappearance of yellow fever in Cuba, after the energetic American campaign of some years ago, which was supposed to have stamped out the disease permanently, is attributed by Gov. Magoon to indifference and neglect on the part of the Cuban local authorities. To Secretary Taft he wrote:

> It is difficult to induce or compel native physicians to take the time and trouble to distinguish yellow fever from other fevers and make report thereon.

After the departure of the first American army of occupation, the sanitary work on the island fell largely into decay. It may be that a certain perverse ignorance has its influence over the natives of the island, similar to the superstitious submission to disease with which Great Britain has to contend in India, or the actual fanaticism which impels Russian peasants, in the famine and plague-stricken provinces, to attack the physicians and destroy their medicine cases. Or is it possible that the Cuban irreconcilables have reasoned it out that yellow fever may be turned into a strong guarantee of national independence? It doesn't bother the inhabitants, seemingly, and it does worry the Americans very much.

Last week we were told that the Government of New South Wales and the Government of the Commonwealth had joined sharp issue on a tariff matter, and that there was talk of revolt and of war. A day or two later came the reassuring statement that the premier of the Commonwealth decided not to call out the Federal troops after all, and that the question will be settled in the courts. It is difficult to see, however, whence the Federal Government would have drawn its "army" to combat obstreperous New South Wales; for, with the exception of a few thousand garrison troops, the forces of the Commonwealth consist of some fifteen thousand militia, distributed among the states according to population. The New South Wales militiamen could scarcely be called upon to take the field against their own state, and making use of the militia of the other colonies against New South Wales would be putting the bonds which hold the young Federation together to a severe test. There is as yet a good deal of grumbling in the different colonies over local causes. Western Australia is disgruntled because of the delayed construction of the transcontinental railway. Queensland feels the "white Australia" policy weigh heavy on her, because of the scarcity of plantation labor. In New South Wales the free-trade tradition is still strong, whereas the Commonwealth Government is increasingly Protectionist.

Even some of the anti-clerical papers in Italy deprecate the violent demonstrations against the clergy which have of late been so frequent. The attempt at Pisa to burn the Church of S. Francesco, the attacks on the Cardinal Secretary, as well as on priests and pilgrims, are strongly condemned by those who see the importance of a more cordial understanding between Church and State. These rough manifestations of hostile sentiment are due chiefly to the radicals and Socialists, who resent any attempt to heal "the open wound of Italy." They are as much opposed to a reconciliation as is the ultra-clerical party. Signor Enrico Corradini has been arguing that these acts of violence are contrary to the modern spirit. He calls them "the atavism of fanaticism." But even the study of history will fail to convince some men that no mere physical violence ever created or destroyed an opinion.

Dr. Dubois, a well-known neurologist of Berne, has successfully applied the principles of psychology to the cure of certain diseases. His theory has just been set forth in a small book entitled "The Influence of Mind on Body." For a number of years he has been reporting cases in the Swiss and French scientific reviews. Without entering into the discussion of the relation between psychical and physical processes, he goes directly to the treatment of disease by means of suggestion and the training of the will. Naturally, it is in the case of nervous troubles that he has been particularly successful. The neurasthenic, who is the most difficult to treat in ordinary ways, is the most susceptible to psychological influences. The restless hysterical subject who "is a virtuoso in the art of making the emotional lyre vibrate," is a familiar figure in modern life. It is not the importance of the idea or event which makes his emotions violent; his morbid states are excessive reactions to comparatively trivial stimuli. In popular language, he makes a fuss about nothing. A mistaken medical treatment may only aggravate these maladies; for no account is taken of the fact that a psychical process gone wrong is the cause, and that a psychical treatment may be a cure of the complaint. Now, instead of medication, Dr. Dubois adopts the method of suggestion. Setting out from the fact that the mind can increase or diminish the intensity of certain physiological processes, Dr. Dubois concludes that the will can, in many cases, control and even cure without the use of medicine. A characteristic mark of neurasthenia is irresolution; but even in the weakest patient there is a residuum of resolution, and it is with this residuum that the psychological method is concerned. The voluntary acts required are at first unimportant and easily performed. These show the patient that he has command of himself, and prepare the way for other acts of the kind, until complete self-control has been attained. The results of the method have been satisfactory. It is characteristic of the hysterical patient to simulate the maladies of which he has any knowledge; and hence the importance of knowing that many distressing disorders, although real, are curable by mental treatment.

MAKING AN IMPRESSION ON THE SOUTH.

It is evident, from Secretary Taft's speech at Lexington, that he means to essay a task which many Republican Presidents and Presidential candidates have attempted since the civil war. It is, by sweetly smiling to soften the heart of that cow. President Hayes was to have done it by withdrawing the troops and appointing a Southerner as a member of his Cabinet. Yet we do not recall that the South was any the less solid in 1880. McKinley was thought actually to have melted the too, too solid flesh of the South. One Southern State voted for him, under the expelling power of Bryan. Then there came the Spanish war, sent by Heaven to reunite the sections; and we had much mutual embracing and wiping away of tears of joy. But the perverse solidity recurred again in 1900. Now, it seems, the job is to be tackled all over again. Says Mr. Taft fervently:

> If only under the influence of President Roosevelt's Administration some of the Southern States, including Kentucky, could be led into the Republican column in accordance with the real sympathies of the voters of those States, it would be a crowning glory of his Administration.

Various motives are dangled before the South. The chief ones are political and selfish. It is such a grief to patriotic Republicans of the North to see the South, with all its talent and statesmanlike aptitude, shutting itself "out of the councils of the nation." That can only mean sharing in the Federal Administration; and, the argument is, voting the Republican ticket more freely, and carrying two or three Southern States for a Republican President, is the only way to do it. But let us see. If an appetite for Cabinet positions is to determine the South's political choices, to which party would this really, on a purely scheming basis of that kind, incline it to lean?

A careful weighing of the chances would, we think, keep the South Democratic. If a stray State or two went Republican, there might follow the offer of a single Secretaryship as a reward for good behavior. No more than that could be hoped for. And in the matter of minor Federal offices, the Republican State or States snatched as brands from the burning in the South, could expect nothing beyond their meagre "quota." In the event, however, of Democratic success, the South would stand to win at least four Cabinet portfolios, and would return to the councils of the nation with a rush. If politics, then, is nothing but a betting-book, any intelligent Southerner, looking at the horse which the Secretary asks him to back, would say that the true odds were on an animal of quite another color.

A subordinate part of Mr. Taft's Lexington appeal was, in effect, that a few Republican States in the South would mean more Democratic States in the North. If the latter were not "confronted with the solidarity of the South," there would be "much more independence of voting" in Northern States which are now kept Republican by the spectacle of a united South. If this is meant seriously, it certainly does furnish a basis upon which Southern Democrats could do business. They might see to it that Kentucky and Florida went Republican, with the result of provoking so much "independence" in New York and Illinois as to make those States go Democratic. That would be a neat exchange of eighteen electoral votes for sixty-six, which might easily of itself determine the election of a Democratic President who would surely welcome the South back to the councils of the nation! But we suppose that Secretary Taft scarcely intended this.

All these political blandishments are certain to fail with an incredulous and obdurate South. If it were simply to figure on the offices, it would find that, in the long run, the balance lies on another side of the account than Mr. Taft suggests. But the South has what it regards as a higher motive than any connected with parties. The Secretary spoke of the pity that citizens of the South should be "frightened at a mere ghost of the past." But it is a present and living terror which keeps the South solid—the obsession of race. So long as that persists in its acute form, it is perfectly useless to expect that Southern voters will be independent politically. Such advances as Mr. Taft makes, they will partly distrust and wholly repel. He may hold up before them as long as he pleases the hope of office through the Republican party, but something more powerful than office sways them, and will continue to do so until the race spectre vanishes from before their eyes.

This cannot happen, under a republican form of government, until the problem of the political relations of the races is settled in a spirit of equity. There is nothing like consciousness of having been unjust to a man, or race, to cause an uneasy dread. And this is why we are so much disappointed that Secretary Taft did not take a higher tone. He did, indeed, speak sympathetically of the hindered strivings upward of the colored men. He gave it as his opinion that there was an "injustice" in the Southern laws discriminating against them politically. But he did not point to the only remedy; he did not say that, if the two sections of the country would have what Cromwell called "peace without a worm in it," they must come together on grounds of fair dealing, with the removal of every such injustice as Secretary Taft spoke of, not its covering up in a wash of amiability. It was not necessary for him to lecture the South, but he might have spoken to its conscience, and the North's too, instead of resorting to what we can only call blarneying.

FRANCE AND MOROCCO.

The situation at Casablanca and in the interior has entered on a phase which, European opinion almost unanimously holds, leads inevitably to a war of conquest and occupation by France. The initial attack on the port town by natives may have been caused partly by the desire for loot; but brigands do not sit down to besiege a European army equipped with machine guns, nor do they charge with fanatical courage in the face of shell fire, except under the impulse of a higher and more unifying principle than mere robbery. Taken in conjunction with the general anti-foreign ferment throughout the region and the appearance of pretenders and prophets, the fighting at Casablanca seems to have been the first striking episode of the Holy War that has so long been expected in North African Islam, and especially in Morocco. Europe seems to be taking it for granted, and with good reason, that France will be free from international interference if near events, as interpreted by herself largely, should necessitate the practical abandonment of the agreement with Germany framed with such care at Algeciras a year and a half ago. The questions that arouse interest at present are how difficult France is likely to find the work that has been cut out for her and whether, having got through with it, she will think it worth while.

That a war of conquest in Morocco would be an enterprise of years and large expenditure, is obvious. At the same time, there is no reason to doubt the ultimate result. The Holy War, like the Yellow Peril, has been endowed with exaggerated danger for the Western mind. Experience has yet to show that religious fanaticism of the most exalted kind is proof against magazine rifles and machine guns, in the long run; the process of subjugation may continue for ten years or for thirty, and it may be interrupted by unpleasant incidents like the decimation of Hicks Pasha's army in the Sudan, or France's own affair with the Chinese in Tonkin, but it would be denying the entire course of history to assume seriously that in a conflict sharply drawn between Europe and the Orient, barbarism could hope for victory. Whatever danger or discomfiture has come to any one Christian Power from Holy Wars and Yellow Perils can be accounted for by the precious aid and comfort which Islam or Asia has received from other Christian Powers.

Assuming the reduction of Morocco as an accomplished fact, many political experts, like the author of a penetrating

article in the London *Nation*, see little profit that would accrue to the French people from adding Morocco to their North African domains. The argument is that the French are the "unexpanding" race, and that colonialism with them must be mainly an artificially stimulated movement, cherished by a comparatively small section of the country. It may be admitted that the entire prevalent conception of colony-grabbing for the sake of that fetich "expansion" is ignoble and in the last resort economically unsound. But in the game as it is being played by the Powers, France has by no means acquitted herself badly, in spite of a general impression to the contrary. Her Indo-China possessions are making unmistakable progress, and her West African colonies are being developed with fair speed, considering the difficulties of the task. The essential point, however, is that Morocco, like Algiers, would scarcely constitute a colony in the proper sense, situated as it would be only across the breadth of the Mediterranean Sea from the suzerain country. Frenchmen, it is true, do not choose to emigrate, as do England's teeming younger sons. Yet Algeria's population of five millions contains nearly three hundred thousand Frenchmen, whereas India, with her three hundred millions, is held for Great Britain by less than one hundred thousand Englishmen. Not only does this comparison favor France, but French expansionists can also urge that of Algeria's foreign commerce of 620,000,000 francs, France controls 80 per cent.

To a large party in France, a serious attempt to solve the Moroccan question will appeal because of the stimulus which the responsibility may be expected to impart to the national life. A campaign in Morocco would be almost worth while if it could convince people once for all of the stability of the Third Republic. The correspondent of the New York *Evening Post* in Paris has recently pointed out that the constantly growing victories of the present government *bloc* in the elections of the last six or seven years should leave no doubt of the weakness of the various anti-republican factions in the country and in Parliament. Yet the Nationalist and Monarchist plotters have been able to keep the nation in a continuous state of fret and anxious heart searching. Are our institutions stable? Can the army be relied upon? Is the young generation utterly gone to the dogs by the way of decadentism and absinthe, or is there health left in us to maintain the old national ideals? If decrepit dynasties have been able to keep themselves erect through foreign adventure, the republic may find at least one item of profit in an enterprise that would keep most of its hotheads out of worse trouble.

SCIENCE VS. COMMON-SENSE.

Prof. Hugo Münsterberg, several of whose random observations on the credibility of witnesses in the Haywood trial were recently spread broadcast in a highly distorted form, has set forth some of his matured reflections regarding legal evidence in an article in the September *McClure's*, "Nothing but the Truth." The only way to solve the problem of testimony in our courts, in his view, is to apply to witnesses the methods of experimental psychology, with a view to determining how far they are capable of reporting correctly the events they have witnessed. Science has learned a great deal about the fallibility of human testimony, even the laws that govern that fallibility; and for the tribunals which exist for the very purpose of ascertaining truth to ignore the discoveries along those lines, is, Professor Münsterberg contends, essentially as benighted as if our hospitals should refuse to practise antisepsis.

Professor Münsterberg makes out an interesting case for his specialty. His article is lightened by entertaining accounts of experiments upon his own students. Thus, a request for comparison of the apparent size of the moon with that of some object held at arm's length, provoked replies ranging all the way from the size of a pea to ten feet. The sound of a hidden tuning-fork was likened variously to a horn, a violin, a fog-horn, and the growl of a lion. Fifty black spots on a sheet of cardboard were set down as low as twenty-five and as high as two hundred. "And yet," says the author, "we should be disinclined to believe in the sincerity of two witnesses, of whom one felt sure he saw two hundred persons in a hall in which the other found only twenty-five."

No doubt, the official psychologist, a duly appointed officer of every court of record, could make important tests of the witness's sense-perceptions. In such a case as that reported the other day in which the disposition of a fortune depended on the order in which persons killed in the same automobile accident had died, there are laboratory methods which would reveal how far the spectator's eyes were to be trusted as observers of the particulars in a complicated and exciting occurrence, and their time relations. This, it may be added, would be almost as much a service to the conflicting witnesses thus acquitted of intentional misrepresentation as to the jury.

The suggestion is of interest not only in itself, but because it is the latest of the long series of attempts to introduce the methods of pure science into the so-called "practical" affairs of the world. Such attempts are always hopeful; they are backed up by arguments as plenty as blackberries, yet for some reason they do not achieve the instant and universal success to which most of them seem entitled. Indeed, there is at many points a reactionary tendency. The same issue of the magazine which contains Professor Münsterberg's article, prints another by Dr. Woods Hutchinson, who advocates throwing overboard the laboratory scientist's contribution to the art of eating and drinking. He says:

> Our earliest scientific studies have been chiefly confined to the positive side of a food's qualities, namely, its nutritive value and its digestibility. Does such and such a food contain so many calories per ounce? Is it digestible in the human stomach? asks the laboratory scientist. Then, if it does, it is a good food.

Fortified with such facts, the food-reformers have carried on the fight for lentils, nuts, beans, and the like as substitutes for meat. But, for all the demonstrations of the bean's engaging qualities, as Dr. Hutchinson remarks:

> Nothing will goad a grading gang or company mess to mutiny quicker than an excess of beans. They will take bread, bacon, "salt-horse," apple-sauce, potatoes, oatmeal, rice three times a day without a murmur; but let beans be served as the principal dish more than two or three times a week, and hear the "roar."

The laboratory scientist is now beginning to admit, says the writer, that he was wrong and the roustabout right. An aromatic oil and a bitter alkaloid have been discovered in the bean which prevent it from becoming a permanently satisfactory substitute for beef and mutton in spite of its high food-value and low cost. Plainly this is a vindication for the inherited common-sense modes of diet.

It is not our purpose here to pass upon the pretensions of either the scientific party or the rule-of-thumb party, which are contending along so extended a frontier. But it must be conceded that, in spite of sudden forays from one side and the other, the rule-of-thumbers are in general slowly giving ground, or rather borrowing from their advancing foes. This is not what the scientists want, and they are sometimes a trifle reluctant to admit the fact. Thus, to return to Professor Münsterberg's article, it is not true that only the experimental psychologist knows how to discount the testimony of honest men who disagree in their statements. Juries neither say nor think, "One of these witnesses says one thing, the other another; plainly one of them is a rogue and a liar." If that were the case, prosecutions for perjury would have to follow in the train of every civil or criminal trial. Nor is the experimental method unknown to up-to-date common sense. "How much time elapsed?" the attorney for the defence will ask of an important witness. "One minute." "Positive it was as much as that?" "Yes,

sir." "Rap on the table," says the lawyer, taking out his watch, "when one minute is up." When the witness gives the signal at the end of thirty-seven seconds, the point is made.

Where common-sense ends and science begins is not always easy to tell in these days. Great industries, common-sense to the core, like the modern creamery business and the chemical trades, are erected on ground that belonged absolutely to theoretical science a few years ago. On the other hand, all the discoveries of medicine have not materially weakened the hold of common-sense remedies like the great tribe of herb-teas, or superstitious remedies like madstones and stockings tied around the bedpost. But science, as a rule, goes farthest where it goes least ostentatiously. Let Professor Münsterberg's psychologists become regular parts of our judicial machinery, and before many years there would be magazine articles informing us how much better men could find out the truth unencumbered by all such mechanism. Everybody respects science, is fascinated by it, profits by it, yet when science comes close too suddenly we cannot quite get over the habit of bolting.

THE PHYSICIAN IN THE SCHOOL.

The International Conference on School Hygiene, held in London this month, raised many questions which should search the hearts of teachers, parents, and taxpayers in America. Some of these questions we have already been debating. In this city last winter Superintendent Maxwell urged that the eyes of school children be examined, and that glasses be provided—if necessary at public expense—for those whose sight is defective. The shortest way with such a proposal is to give it a bad name and damn it. Accordingly, the plan was received by a part of the press with jeers and cries of "Socialism!" Mr. Maxwell's reply was in effect that we are spending millions a year for teachers, buildings, text-books, and apparatus; and that it is worth while to lay out a little more in order to enable all the children to profit by these facilities. In an article in the *Nation* of April 25 he said:

> It seems folly to supply books to children who cannot read them, or to place children in classrooms when they cannot see what is written or drawn on the blackboard. If the sight is defective, the child is hopelessly handicapped. The expenditure of a few thousand dollars for glasses would enable thousands of children who are now unable to do their school work to stand on the same level with their fellows.

These words sum up briefly the whole argument for the physical examination of school children and the attempt to keep them in such health that they can fairly avail themselves of the advantages offered. Whether this be Socialism or not, we cannot dismiss the matter with a question-begging epithet. Our American school boards must consider the project on its merits, and decide whether in justice to the children as well as to the community as a whole we should not devote more attention to the physical well-being of pupils.

Not that this aspect of education is totally neglected. In a number of places in this country fairly elaborate machinery has been devised, not merely for suitable gymnastic exercises, outdoors and in, but for the supervision of pupils by regular physicians. These places, however, are oases. In America as a whole the majority, we venture to say, of our teachers, 90 per cent. of our school trustees, and 99 per cent. of parents and taxpayers are ignorant of the handicaps under which physically defective children labor, and the number of such defects. Under these circumstances, school authorities, even in some of our large cities, would not now be supported by public opinion were they to organize a really effective system for examining the children and correcting merely those defects the cure of which requires a minimum outlay of time and money. Some of the facts presented at the London Conference are startling. A Dr. Dukes gave the results of his physical examination of a thousand boys on their entrance into Rugby. Those boys he regarded as a special class—"strong, healthy, well-fed, and reared mainly in the country." Yet among them he found 445 cases of lateral curvature of the spine, 526 cases of knock-knee, and 329 flat feet. These deformities were not congenital, but acquired and preventable, "indicative of inferior systems of nurture and education" between the ages say of five and thirteen. From the extent of these maladies among "the most favored class of boys in Great Britain" (but 57 of them had neglected teeth); one can imagine the disabilities of less fortunate children.

Dr. Dukes's figures are not legal proof of conditions on this side of the Atlantic. No doubt, however, there are many such minor deformities among applicants for admission to our best secondary schools. So far as New York city is concerned, we are not forced to rely on conjecture. In the year 1906, some 78,401 children were examined. Among them were 29,177 cases of enlarged anterior glands; 1,096 cases of cardiac disease; 17,928 of defective vision; 39,597 of neglected teeth; 18,306 of hypertrophied tonsils. The total number found to require medical treatment was 56,259, or nearly 72 per cent. of those examined. Moreover, the great majority of these children who suffered from physical disability were backward in studies—from one to five years behind the grade in which their age would naturally place them. The statistics for New York cannot be very far different from those for Boston, Philadelphia, and Chicago.

Evidently, then, this is a serious business. We are fully committed to generous maintenance of public schools. The general diffusion of intelligence is—we are fond of saying on Fourth of July—the very cornerstone of this republic. As a logical extension of the principle of public education, many cities and towns now furnish text-books free. To regard the physical welfare of the children is a step in the same direction, but not a longer one. Physical defects, the experts assure us, are the real trouble in most cases which we inaccurately call stupidity, inattention, indifference to study, ill-temper, sullenness, malicious disobedience, and truancy. What the child who fails to keep up, who drops out, and takes to the streets and to crime—what he often needs is not extra tasks by way of punishment, the birch, or the discipline of a reformatory, but glasses to correct astigmatism, the removal of adenoids, or the services of a dentist. That he may obtain such medical attendance, it is neither necessary nor desirable to incur the heavy expense of enlarging our hospitals and dispensaries and increasing their staffs. Children are allowed to suffer, not so much because medical treatment is costly, as because parents are ignorant. We are persuaded that, if every school system had its physicians to report cases needing attention, much would be done by private initiative to relieve the sufferers from eye-strain and, from disorders of the digestive tract and of the respiratory organs, much to improve the discipline of our schools and increase their general efficiency, much to accomplish the true ends of public education—training our youth to become intelligent and useful members of the commonwealth.

BIBLIOGRAPHICAL NOTES ON DEFOE—III.

In this final instalment of these notes I shall enumerate the tracts which I think should be added to Defoe's list over and above those attributions to him by Lee and Crossley in which I concur, and also the items which I am very strongly disposed to assign to him, but which for one reason or another it seems best to group as tentative ascriptions only. I do not include here the few items I accept from Wilson and the British Museum Catalogue, nor do I even mention the names of a large number of very possible attributions which I am still investigating. Whenever I can do it briefly, I shall indicate some of the reasons that seem to warrant an ascription, but in the main I must content myself with the statement that I have subjected all these tracts to about twenty different tests derived from my study of Defoe's undisputed writings, and that in every case I have declined to admit an item in connection with which an unfa-

vorable result was obtained. In no case probably, could every test yield positive results, on account of variations of subject matter and because of Defoe's versatility of manner, but I have admitted no tract which did not yield a cumulation of favorable results with respect both to substance and to style. It has seemed to me that previous investigators have relied too much on mere verbal tests (cf. the curious list of words and phrases given by Lee in his Introduction), and that they have been too rash in attributing short tracts in which Defoe's peculiarities had no chance to show themselves in abundance. I ought to add that, although I have left no portion of Defoe's work unexamined, I have concentrated my attention on his political tracts, and that I have been able in consequence to make use of a variety of tests based upon his methods of arguing, his favorite ideas, his anecdotes, and a number of other special features, which cannot be detailed here, but which I hope to describe fully in my bibliography. I have utilized, of course, all the bibliographical helps known to me—library catalogues, Halkett and Laing, the anonymous books dealt with in *Notes and Queries*, the indexes of bibliographical journals and papers, and the like, and have gained, I trust, through the painful process sufficient wisdom and patience and modesty to be prepared for the detection of blunders, nay, even to be thankful to the detectors. And first of the more or less positive ascriptions:

(1.) "Lex Talionis, or an Enquiry into the Most Proper Ways to Prevent the Persecution of the Protestants in France" (1698). This tract appeared in the pirated edition of Defoe's works published early in 1703. As he declared in the Preface to his genuine collection of the same year that the spurious edition had included "Several Things" in which he had had no hand, and, as the genuine volume contained all the items of the fraudulent one save this tract and one apparently by Tutchin, "Lex Talionis" has naturally been omitted by previous Defoe students. Disowning genuine works and upbraiding pirates for misprints that cannot be discovered by modern readers were not, however, practices absolutely unknown in the reign of Queen Anne. Prior seems to have been guilty of them; and I am quite sure that Defoe indulged in them indirectly, with regard to "Lex Talionis." Possibly to republish such an attack on the Roman Catholics did not seem politic for an author about to be tried for libel; but whatever his reasons for suppressing it, the tract is in my judgment plainly his. As I have already said, I have a great respect for the ability of Defoe's contemporaries to ferret out his publications.

(2.) "A Short Letter to the Glasgow Men" (1706). I have never seen this tract, a copy of which is in the Advocates' Library. But I have read the reprint of it in the *Review* for January 2, 1706-7, and I knew previously from Defoe's correspondence that he had written the Letter and had had it printed in Scotland.

(3.) "Dyers News Examined as to His Swedish Memorial against the Review" (1707). This sheet is different from the item on the same subject given by Lee (No. 102), and is certainly by Defoe. I discovered it bound in with the British Museum copy of vol. iv. of the *Review*. It is not in the Museum Catalogue, but I found later that Mr. Aitken owned a copy, which he had, of course, attributed to Defoe.

(4.) "A Supplement to the Faults on Both Sides, etc." (1710). Both this pamphlet and the one to which it purports to be an addition have been attributed to Defoe, and the entire series of about a dozen tracts in answer to Hoadly's "Thoughts of an Honest Tory," etc., presents many bibliographical puzzles. I can here only express the strong conviction that Defoe did not write "Faults on both Sides," but did write the "Supplement," which contains many of his special ideas and phrases, and one peculiar use of a proverb taken from the Italian which I have found in numbers of his tracts, but only twice in other writers of the period.

(5.) "A Speech for Mr. D——sse Younger of Arnistown, etc." (1711). Attributed to Defoe in the catalogues of the Guildhall Library and of Yale. Defoe's correspondence contains proof that he was asked to write something on the row started by the acceptance of a Jacobite medal by the Faculty of Advocates, and it seems highly probable that this is his response—though perhaps not his sole one—to the request. It is almost certainly the work of an Englishman trying to write like a Scotchman, and it contains not a little of Defoe's irony.

(6.) "The Succession of Spain Consider'd; or, a View of the Several Interests of the Princes and Powers of Europe, etc." (1711). In style and substance this seems plainly Defoe's, especially in his reference to his relations with William III.—he liked to make such references, and was duly laughed at for them—and in his scheme for parcelling out the Spanish dominions.

(7.) "A True Account of the Design and Advantages of the South-Sea Trade: With Answers to all the Objections rais'd against it, etc." (1711). Given to Defoe by the Astor Library and by the British Museum. The latter, however, quotes the title page as reading "By the Author of the Review," words which would settle the authorship but which occur in no copy I have seen. I thoroughly concur in the ascription of this interesting tract, which comparison shows to be by the author of

(8.) "A Letter to a Member of Parliament, on the Settling a Trade to the South-Sea of America" (1711).

(9.) "An Enquiry into the Dangers and Consequences of a War with the Dutch" (1712). My attention was first called to this tract by Thomas J. Wise. It has so many special Defoe features that ascription to him seems to be thoroughly justified.

(10.) "The Justice and Necessity of a War with Holland, etc." (1712). This tract is simply crammed full of characteristic Defoe features, and the same is true of

(11.) "The Vallidity of the Renunciations of Former Powers Enquired into, and the Present Renunciation of the Duke of Anjou Impartially Considered, etc." (1712).

(12.) "Plunder and Bribery Further Discovered, etc." (1712). This seems to be certainly Defoe's, and a sort of sequel to the tract "The Re-Representation" of the year before attributed to him on strong grounds by Crossley.

(13.) "No Queen; or, No General, etc." (1712). This attack on the Duke of Marlborough, whether creditable or not to Defoe, is as clearly from his pen as almost any of the works attributed to him on internal evidence alone.

(14.) "Memoirs of Count Tariff, etc." (1713). From the excessive use made of this pamphlet in Defoe's *Mercator*, I was led to suspect his authorship, and a perusal of the tract speedily converted suspicion into practical certainty. I found later that Colonel Grant had previously made the attribution.

(15.) "The Reasons and Necessity of the Duke of Cambridge's Coming to and Residing in Great Britain, etc." (1714). This may very justly be called a rash ascription, since it is a tract in which the author takes the Government to task for the pardon recently granted Defoe for his offence in writing "What if the Pretender Should Come?" and his other so-called Jacobite pamphlets. I believe, however, that this reference was intended as a blind; that the tract, which was published without a bookseller's name, represented Defoe's real political opinions; and that his chief object was to vent his spleen on *The Examiner* and on Abel Roper. In style and substance it is Defoe's or nobody's—a temerarious statement which will not be taken too literally by persons who have had experience in attributing pamphlets.

(16.) "Impeachment, or No Impeachment, etc." (1715). This is one of the anti-Harley tracts attributed to Defoe by Boyer, and I thoroughly concur in the ascription. It may be worth while to add that Boyer enumerated fourteen items, and that Defoe replied, "of all that number, there is but one that I was sole author of, not above three that I ever had any hand in, and five or six that I never saw in my life." Crossley, writing to *Notes and Queries* apropos of the tracts on the Triennial Bill, took Defoe literally, and understood him to refer to "Advice to the People of Great Britain, etc." (Lee's list, No. 158), as the tract he wrote entirely, and to the three parts of "The Secret History of the White Staff," *Mercurius Politicus*, and *Mercator*—though the last, as Crossley admitted, was not named by Boyer as the three he had had some hand in. Curiously enough, considering his confidence in Defoe and his want of confidence in Boyer, Lee accepted six items of Boyer's list, and Crossley in his later list of sixty-one added two other titles given by Boyer. Thus these sturdy champions of Defoe's honesty, whether consciously or not, slowly came over toward Boyer. I go practically over to his side, for of the twelve items of his list that I have examined there is only a single one that I am not compelled to attribute to the evasive Daniel, and that one I strongly suspect him to have written. And I have good reason to think that one of the two items I have not seen was correctly attributed.

(17.) "The Folly and Vanity of Impeaching the Late Ministry Considerer'd" (1715). This is one of Boyer's fourteen, and is in my judgment certainly Defoe's.

(18.) "A Letter from a Country Whig, to his Friend in London; Wherein appears Who are the Truest Friends to their King and Country" (1715); and

(19.) "A Second Letter from a Country Whig, to his Friend in London; Relating to the Matter of Impeachments, etc." (1715). The second of these tracts seems to me for a number of reasons to be certainly Defoe's. I am less certain about the first; for, although that has many of his peculiarities, it is barely possible that for reasons of his own he stepped in and produced a continuation of a tract written by another. This is very unlikely, however, and I think that the pair of pamphlets should be unhesitatingly added to his long account.

(20.) "A Letter to a Merry Young Gentleman, Intituled, Tho. Burnet, Esq.; In Answer to One writ by him to the Right Honourable, the Earl of Halifax, etc." (1715). This attack on Burnet, who is attacked along with Bradbury in one of the tracts attributed to Defoe by Crossley, is full of our author's characteristics, both of style and of matter, and from the tone of its references to Defoe himself is plainly to be accredited to him.

(21.) "Some Reasons Offered by the Late Ministry in Defence of their Administration" (1715) is in my judgment clearly by Defoe.

(22.) "The Traiterous and Foolish Manifesto of the Scots Rebels, Examined and Expos'd, Paragraph by Paragraph" (1715). This is as plainly Defoe's as internal evidence can make it, a statement which may also be made of

(23). "An Attempt Towards a Coalition of English Protestants, etc." (1715).

(24.) "Bold Advice; or, Proposals for the Entire Rooting Out of Jacobitism, etc." (1715). I attribute this to Defoe, not merely on account of its many idiosyncrasies of style and substance, but also because it tallies with a passage in the *Review* with regard to a book Defoe declared he was preparing for the press.

(25.) "The Secret History of the Secret History of the White Staff, Purse, and Mitre. Written by a Person of Honour" (1715). This extraordinary performance was mentioned in the first instalment of these notes. It was ascribed to Defoe by a contemporary, was printed by his friend Keimer, and bears, in my judgment, every mark of genuineness.

(26.) "An Essay Upon Buying and Selling of Speeches, etc." (1716). Defoe's peculiarities even down to the most minute details, emerge so abundantly in this pam-

phlet that its ascription to him might be almost considered imperative.

(27.) "Some Thoughts of an Honest Tory in the Country, upon the late Dispositions of Some People to Revolt, etc." (1716). This seems clearly Defoe's, both from its style, and from its correspondencies with several of his undisputed pamphlets.

(28.) "The Triennial Act, Impartially Stated, etc." (1716), and

(29). "Arguments about the Alteration of Triennial Elections, etc." (1716). These two tracts were discussed in my first communication.

(30.) "The Conduct of Robert Walpole, Esq., etc." (1717), and

(31.) "The Conduct of the Lord Viscount Townshend" (1717). I have seen only the first of these pamphlets, but the similarity of titles, and the way the first tract advertises the second, make me feel very sure that both are by the same author. The first is unmistakably Defoe's in style and substance, and the second was directly attributed to him by Boyer, in the list of fourteen, nearly every item of which I believe to have been correct.

(32.) "Some Persons Vindicated against the Author of the Defection, etc." (1717). This pamphlet, in answer to a notorious attack on Walpole by Tindal, was fathered upon Defoe by the author of the "Memoirs" of Tindal (1733). It is clear that the legend "R——— W———, Esq.," where we should expect the name of the author of the tract, was a mere decoy, and I am entirely convinced that Defoe wrote the pamphlet. I am equally certain that he immediately turned round and wrote

(33.) "The Defection Farther Considered, etc." (1717), in which he took Tindal's side against Walpole. This tract is sometimes given to Tindal, but his biographer explicitly states that Tindal did not answer his opponents, Sewell and Defoe, and I am as positive as one dares to be in such matters that Defoe answered himself, as he was often accused of doing. If we are to give any tracts to Defoe on internal evidence, and a large proportion of the works accepted as his for a century and a half can have no other justification, we must give him both these pamphlets, however little credit they may reflect upon him.

(34.) "An Argument Proving that the Design of Employing and Ennobling Foreigners is a Treasonable Conspiracy, etc." (1717), and

(35.) "A Farther Argument against Ennobling Foreigners, etc." (1717). The first of these two attacks upon Toland's "State Anatomy of Great Britain," was, I believe, despite the views of previous students of Defoe, rightly charged upon him by Toland and Boyer. The biographers have rejected both pamphlets, because of the explicit statement made in the second that Defoe had nothing to do with writing the first; but his word is worthless in such matters, and his style bewrays him. It is little less than absurd to attribute the "Mesnager" book to him and to hesitate at these fulminations against a man Defoe constantly attacked.

(36.) "The Case Fairly Stated between the Turky Company and the Italian Merchants. By a Merchant" (1720). This is among the Defoe items in the Pearson Catalogue, but is not on Crossley's list. I am fully convinced that it is Defoe's, but I am not prepared to assert that he wrote a reply to it, also "By a Merchant," entitled "The Turkey Merchants, and Their Trade Vindicated, etc." (1720), which is likewise in the Pearson Catalogue.

This brings us to the mass of pamphlets dealing with the South Sea Bubble. Defoe is likely to have written more tracts on the subject than Lee has assigned him, and I have found several that I very much suspect to be his; but I prefer at this stage of my work to make no definite attributions. I shall now give a list of tracts which, if I may so phrase it, I have been and still am on the very verge of attributing to our voluminous author. It is needless to add that I am anxious to secure all possible information about them:

(1.) "The Case of the Dissenters, as affected by the late bill proposed in Parliament, for preventing Occasional Conformity. By a Gentleman" (1703). I have read this only in the "Somers Tracts" and judge solely from the internal evidence. Everything makes for Defoe's authorship, but there seems to be need of a greater abundance of characteristic features.

(2.) Some Conjectures Concerning the Causes of the Difficulties which the German Branch of the House of Austria meets with at this Time in their Way to the Crown of Spain" (1705). This is attributed to Defoe in a volume of tracts in the Yale library, and I am inclined to support the attribution, though I think the internal evidence somewhat insufficient.

(3.) "Remarks on the Letter to the Author of the State-Memorial" (1706). This was attributed to Defoe by the late Col. F. Grant, as I learn from a list of his attributions which was kindly given me by Thomas J. Wise. It is hard to resist the conclusion that the tract is Defoe's, and the occasion that brought it out was certainly one such a pamphleteer would have seized.

(4.) "The High-Church Mask pull'd off: or, Modern Addresses Anatomized, etc." (1710). This attack upon Sacheverell might very well, I think, be Defoe's.

(5.) "A Spectator's Address to the Whigs on the Occasion of the Stabbing of Mr. Harley" (1711). If this tract were only a little longer I should unhesitatingly attribute it to Defoe, and, as it is, I have scarcely a doubt of his authorship.

(6.) "Plain English with Remarks and Advice to Some Men who need not be Nam'd" (1712). It really seems to be an excess of scrupulosity to put this short tract here rather than among the positive ascriptions.

(7.) "An alarm to the People of England Sounded in an Oration from the Top of St. Paul's Cathedral, London" (1713). The disguise adopted, and the general tone, make me almost confident that this is one of Defoe's sermons, a form of discourse of which he was fond.

(8.) "The right of the Sovereign in the Choice of his Servants, etc." (1714). This pamphlet upon a subject on which Defoe often expressed himself is almost certainly from his pen, but it does him no credit, and it is chiefly on this account that I refrain from positive ascription.

(9.) "Whigs and Tories United; or, the Interest of Great Britain Considered, etc." (1714). After a little wavering and very careful study of this tract, I am compelled to regard it as almost certainly Defoe's.

(10.) "A Vindication of the Earl of Oxford" (1715). If Boyer had included this tract in his list of fourteen, I should have followed his lead. As it is, I hardly feel willing to attribute, without some contemporary backing, so meanly ironical an attack upon his former employer, even to such an intriguer and turncoat as Defoe; yet it would almost take a dozen well authenticated contemporary attestations of his innocence to make me give up the conviction I have that he wrote it.

(11.) "An Essay upon Divorcement, etc." (1715). This tract, which was first brought to my notice by Mr. Wise, is really little more than a reprint, whether in whole or in part I cannot say, of Milton's "Doctrine and Discipline," with adverse comments which certainly have much of the tang of Defoe.

(12.) "The Sighs of the Church of England" (1715). I can attribute this performance to no other author, but the elevated scriptural style affected, although sometimes used by Defoe, renders a very positive ascription unsafe.

(13.) "A Letter Concerning the Report from the Committee of Secrecy, etc." (1715). This short, ill-printed tract contains what seems certainly to be the "Letter from Robert Walpole, Esq.," which is one of Boyer's fourteen items and is plainly a forgery, whether by Defoe or by another. This forged letter, which caused some little stir, need not necessarily be assumed to be the production of the author of the main "Letter" that includes it, and although I very much suspect that Defoe wrote that main "Letter," and perhaps the forged letter as well, I must frankly admit that my suspicion is based upon internal evidence that might be stronger.

(14-15.) "A Letter to a Friend in Suffolk" and "A Second Letter, etc." (1716), already mentioned in the discussion of the pamphlets on the Triennial Bill. Both were attributed to Defoe by Colonel Grant on plausible grounds.

(16.) "A Short and Sure Method Propos'd for the Extirpation of Popery, in the Space of a Few Years, by a Person of Quality" (1716). This pamphlet is the most interesting of the additions I have to propose, because, if it be accepted, it furnishes us with the earliest of Defoe's recovered publications. It consists of a preface of thirty-five pages which ushers in a tract of less than half this length, ostensibly published in 1689 for the enlightenment of the Convention Parliament. The preface is so entirely in Defoe's general manner, though marked by fewer salient peculiarities than I could wish, that I have a strong inclination to ascribe it to him. Whether the tract proper, which purports to be by "A Person of Quality," is also by Defoe, is a point about which I am a little less sure, but it, too, is strongly marked by Defoe characteristics. The attitude toward Roman Catholics and the rather chimerical plan for getting rid of them are consistent with what we know of him, and he was in the habit of putting his materials to a variety of uses. The original tract was written to influence a new monarch, William III., but had been ineffectual; now the beginning of another reign, that of George I., seemed to offer an opportunity to put the schemes into practice. It must be added that the tract proper appeared in vol. iii. of the "Somers Tracts" (1751), and that both preface and tract appeared in vol. iv. (1751). This would seem to indicate that there had really been an edition without the preface, but the point is not clear. I must add that I am quite aware that Defoe declared that he never drew his pen before his satire "A New Discovery, etc." (1691)—a statement which contradicts others subsequently made by him.

(17.) "The Mercy of the Government Vindicated, etc." (1716)—very much in the manner of tracts on the late rebellion attributed to Defoe.

(18.) "An Essay Towards Real Moderation" (1716). So many of Defoe's peculiarities are packed into this little tract that it is with great hesitation that I follow my general rule of refraining from positive attribution in the case of short productions.

These are all the suspected items that I think it best to mention at present. There are several South Sea tracts, half a dozen attributions or suggestions by Mr. Wise and Colonel Grant, and some twenty-five pamphlets on miscellaneous subjects which I wish to subject to still further analysis. It remains only to sum up briefly the results of these Notes and to append a list of *desiderata*.

From the 254 items of Lee's bibliography I have subtracted for my own purposes 23 titles of newspapers, etc., leaving 231 books and pamphlets. One of these Lee acknowledged to be an error, another he would have acknowledged had he lived, and I think six other titles should certainly be taken from his list. This leaves 223 items, and from these I should personally subtract only six of the nineteen items which I have enumerated as more or less suspicious. To the 217 items left we should add, however, two Lee accepted in his lifetime and one he would certainly have accepted, since it was excerpted from an item still in manuscript when he made his catalogue. This leaves what may be called the revised Lee list of books and pamphlets standing at 220. To these

I add positively from Wilson's list two items, and from the British Museum catalogue three others, one of which, "The Trade of Britain Stated" (1708), is proved hy the *Review* to he Defoe's. To these 225 items I add positively from Crossley's list of attrihutions at least 28 titles, and to the 253 thus obtained I suggest the addition of 36 more. This hrings the number of books and pamphlets which I feel sure are nearly all ahle to stand the attacks of any doubter who is at the same time a competent Defoe specialist, up to the enormous number of 289. But some of Crossley's attributions I have yet to find; twenty of those I have found seem most probahly to be Defoe's, although I should like to suspend judgment until I can reëxamine them in the light of recent experience; there are at least thirty of the pamphlets included in my lists of strongly suspected and of less probable, but still very possible tracts which have to he reckoned with; and finally there are a dozen or more short performances in prose and verse attributed to Defoe in the catalogues of lihraries to which I hope to give some attention later. I should not like therefore to promise that I will stop the bibliography I am preparing short of 350 items, and there seem to be almost, if not quite, as many rejections to be enumerated. I really do not know who is most at fault, Defoe for writing so much or myself for spending so much time over these musty old pamphlets. Yet, if the truth needs to be told, I enjoy the task, and I hope that those readers of the *Nation* who are willing to humor a "crank," and are able to help him, will examine the following list of *desiderata*, and give any information they have about any item. It is only fair to add that the slight and vague character of some of the titles is due to the insufficient data given in the manuscript lists I have utilized, and also that in view of the hundreds upon hundreds of pamphlets I have had to examine, I may have passed over in some of the libraries and the catalogues I have used one or more of the items I am in search of.

I. Items from Crossley's List of Sixty-One Ascriptions:

I. "Wise as Serpents, or, an Inquiry into the Circumstances of the Dissenters" (Baker, 1712). There is a copy of this tract in the Advocates' Library.

(2.) "Continuation of Letters written hy a Turkish Spy" (1718?—figures hard to make out; the publisher seems to have been Taylor, who accepted "Robinson Crusoe").

(3.) "A Brief Debate upon the Dissolving the late Parliament" (Roberts, 1722).

(4.) "Royal Progress" (Roberts, Brotherton, and Dodd, 1724). A copy of this is in the Redpath collection in the library of McGill University.

(5.) "Some Considerations on the Reasonableness and Necessity of Encreasing and Encouraging the Seamen" (Roherts, 1728).

(6.) "Advantages of Peace" (Brotherton, 1729).

(7.) "The True State of the Case as relates to the South-Sea Trade" (Baker, 1711). This last is the tract which may possihly have heen confused with another given in Crossley's list.

II. Items from other sources:

(8.) "Ways for Advancing the Nation" (1702—attributed to Defoe by Isaac Reed).

(9.) "The Patriots—a Poem" (1702, folio).

(10.) "Tempus Adest, or a War inevitahle, etc." (1702—this seems from Wilson to he against, not by, Defoe).

(11.) "The Liherty of Episcopal Dissenters in Scotland truly stated. By a Gentleman (1703—in all the chief lists, hut I can find no clear evidence that any of the bihliographers has ever seen a copy).

(12.) "The Reformer Reformed" (1703).

(13.) "The Layman's Sermon upon the late Storm, held forth at an honest Coffee-House Conventicle, etc." (1704—in most of the lists).

(14.) "The Comical History of the Life and Death of Mumper, Generalissimo of King Charles the Second's Dogs. By Heliostropolis, Secretary to the Emperor of the Moon" (1704). I should very much like to know whether this book has ever heen seen. It seems first to have heen set down by Chalmers, who got the title from advertisements in the *Review*. But Defoe indulged in hoax advertisements, and Wilson, who entered the supposed hook in his list, confessed that he had never seen a copy. I rather think that it will be found only in some lunar lihrary.

(15.) "A Letter from the Man in the Moon, etc." (1705).

(16.) "A Second Journey to the World in the Moon, etc." (1705). These are the reprints from "The Consolidator" entered as separate entries hy Lee, though he certainly did not own them, and I suspect had never seen them.

(17.) "A Declaration without Doors, etc." (1705). I have read the suhstance of this in the *Review*, hut should like to see the tract.

(18.) "The Rahhler Convicted, etc." (1706)—a copy of this is in the Advocates' Library. It is attrihuted to Defoe on the authority of Wodrow.

(19.) "The Fifteen Comforts of a Scotchman. Written by Daniel De Foe in Scotland" (1707).

(20.) "Reflections on the Lord Haversham's Speech in the Committee of the Whole House of Peers, etc." (1707). Attrihuted to Defoe by Halkett and Laing.

(21.) "Account of the Speeches in the Scottish House of Parliament for the Week preceding the Union" (1707?).

(22.) "Dr. Sacheverell's Recantation; or the Fire of St. Paul's quickly quenched, etc." (1709). Copies of this must have heen used by Sacheverell bihliographers, but I have failed to find any, and should he specially glad of information on the point.

(23.) "The New Wonder; or a Trip to St. Paul's. By the Author of the True-Born Englishman" (1710).

(24.) "Law *not* a Bottomless Pit" (1712).

(25.) "View of the Dangers of the Succession from France" (1713).

(26.) "Some National Grievances Represented" (1717)—one of Boyer's fourteen attributions—which I am anxious to see. It is in the British Museum, but I carelessly took too late a note of it.)

(27.) "An Account of the Conduct of Lord Viscount Townshend" (1717). This is the other Boyer item that I have not seen.

(28.) "Case of Poor Insolvent Dehtors and Prisoners throughout England" (1720).

(29.) "Christian Conversation in Six Dialogues, etc." (1720). There is a copy of this in the Advocates' Library.

(30.) "*Flagellum:* or, a Dry Answer to Dr. Hancocke's Wonderfully Comic Liquid Book, etc." (1723).

(31.) "Mere Nature Delineated: or a Body without a Soul, etc., (1726). Almost certainly by Defoe. I very much wish to see a copy.

(32.) "*Dissectio Mentis Humanæ:* or a Satiric Essay upon Modern Critics, etc., etc." (1730, Warner). Apparently not Defoe's.

(III.) Items not dated:

(33.) "The Lunacy—a Poem."

(34.) "Hanging no Dishonor."

(35.) "Letter to the Duke of Argyle."

(IV.) Items from the Pearson Catalogue:

(36.) "Conference with a Jacobite" (1716).

(37.) "Essay on Puhlic Industry" (1724).

(38.) "General History of Revolutions" (1712).

(39.) "Interest of Holland" (1712).

(40.) "A Layman's Vindication of the Church of England" (1716).

41.) "Le Roy sans Foi not applicable to the French King."

(42.) "Luxury, Pride, and Vanity the Bane of the English Nation."

(43.) "A Most Advantageous and Necessary Project for England" (1725).

(44.) "Narrative of the Murder of Mr. John Hayes by Catherine, his Wife."

(45.) "Proposal for Paying off Public Deht" (1720).

(46.) "Proposal for Promoting Industry" (1732).

(47.) "Regular Government and Judicious Employment of the Poor" (1721).

(48.) "Secret History of the late Ministry" (1715).

(49.) "Tavern Scuffle, or the Club in an Uproar, etc." (1726).

(50.) "To the Queen: The Treasonable Supplication of Protestant Dissenters" (1714).

(51.) "True State of Puhlic Credit" (1721).

(52.) "Two Arguments never hrought yet" (1718).

It is, of course, not unlikely, in view of the hundreds of titles I have had to search for and of the fact that some searching had to be done for me hy others, that, as I have already said, one or more of the above tracts may be found in collections I have already examined. Any information I can get will be welcome, especially with regard to items accessihle in America, and also with regard to tracts assigned to Defoe by the owners, yet not given to him by any of the chief hihliographical authorities.

W. P. Trent.

Correspondence.

REVISION OF THE TARIFF.

To the Editor of The Nation:

Sir: During the Presidential campaign of 1904, when long suffering housekeepers, taxpayers, and consumers cried out for tariff revision and reduced cost of living, we were told hy those having authority that undouhtedly the tariff should be revised and would be revised; hut that the tariff must be revised hy its friends. We consumers waited and hoped—more or less.

In my recollection, the tariff had twice heen revised by its friends: in Harrison's Administration, when friendly revision resulted in the McKinley tariff; and in McKinley's Administration, when it resulted in the Dingley tariff. Since which, during the last ten years, the tariff has been in the hands of its friends, its best friends, and its friends alone. One is therefore justified now in drawing conclusions upon the results of this policy of leaving it and the consumer in the hands of the friends of the tariff.

Under their guardianship we have seen higher and higher protection.

The average consumer has no idea of the amount of the tax he pays for the benefit say of the glass manufacturers.

We have seen Trusts conceived, born, and grow to monstrous proportions.

The fortunes of the favored few swell until their power has become a menace to national life.

The cost of living mounts and mounts and mounts.

Under tariff protection from foreign competition, we have seen the iron, coal, oil, and lumber of our vast territory pass almost entirely into the hands of three or four monopolies.

Do the American people understand this peril and what it means?

We have gone on waiting with what patience we might, telling ourselves that

one general crop failure (a sore price to pay for even a great lesson) would teach our remarkable people that their wealth and prosperity was founded upon a firmer base than log-rolling; to wit, natural resources, pluck, and energy, not political sleight of hand; that their wealth was in spite of protective shackles, not because of them, just as their good health is in spite of their astonishing patent medicines, not because of them. But the crops have been bountiful, and the politicians apparently able to convince the voters that this bounty was possible under protected Trusts alone, one of those necessary evils without which the good must all perish so to sneak.

Next year the United States will again be in the throes of a Presidential campaign. Can we not fight to have "the tariff revised by the friends of *the people*"?

ELEANOR H. GLASS.

Geneva, Switzerland, August 14.

BALLAD ORIGINS.

TO THE EDITOR OF THE NATION:

SIR: In his notice of "The Popular Ballad," August 8, your reviewer, doubtless without design, gives his readers the impression that my "theory" of ballad origins is based on an impossible formula of the Grimms, and is a raft from the Romantic wreck to which I cling quite dolorous and alone. May I recommend to those readers, and incidentally to the reviewer, Professor Kittredge's explanation how *das Volk dichtet*, in his Introduction to the one-volume edition of Child's "Ballads"? This explanation is in expressed accord with the main doctrine which the reviewer regards as mere haze and delusion, and is set forth by a man not given to superficial studies of an important question. Taken in its Romantic form, the notion that a singing throng composed any coherent narrative ballad of the type, say, of "Robin Hood and the Monk," is as silly as to credit Johnson's Dictionary to an earthquake in the printing house. Nobody believes such stuff, nor should a modern writer be charged with believing it. Professor Kittredge has shown how a ballad like "The Hangman's Tree" could be improvised in a crowd, and by a crowd; and my object was to prove that the ballad structure itself is derived from choral repetition. Ballads themselves, however, are the outcome of tradition, which has handed down versions sprung from the most varied sources, arriving by every conceivable means at different degrees of poetic coherence and narrative art, and demanding separate lines of investigation. The inimitable note of balladry is due to the choral origins of its structure and to the impersonal tendencies of all traditional verse, but not to any miraculous or even mysterious element in its making. All poetry springs from the same poetic impulse, and is due to individuals; but the conditions under which it is made, whether originally composed in a singing and dancing throng and submitted to oral tradition, or set down on paper by the solitary and deliberate poet, have given birth to that distinction of "popular" and "artistic," or whatever the terms may be, which has obtained in some form with nearly all writers on poetry since Aristotle.

FRANCIS B. GUMMERE.

Haverford, Pa., August 12.

Notes.

The autumn announcement list of Charles Scribner's Sons includes "The France of To-day," by Prof. Barrett Wendell; "The Old Dominion," essays on the early life and history of Virginia, by Thomas Nelson Page; "Inquiries and Opinions," a volume of essays by Prof. Brander Matthews; "The Novels of George Meredith," a study by Elmer Ellsworth James Bailey; "Vers de Société," the fifth in Miss Carolyn Wells's series of anthologies; "The Call of the West," a presentation of America "in the process of revelation to sixteenth-century Englishmen," by Sidney Lee; "History of Babylonia and Assyria," by Hugo Winckler, translated by Prof. James A. Craig; "Paris," by Hilaire Belloc; "Chile," its history and development, natural features, products, commerce, and present condition, by G. F. Scott Elliott, with an introduction by Martin Hume; "The History of Mediæval and of Modern Civilization to the End of the Seventeenth Century," by Charles Seignobos of the University of Paris, translated, with an introduction, by Prof. James Alton James; "Marie de Medicis and the French Court of the Seventeenth Century," translated from the French of Louis Batiffol by Mary King; "Epochs in the Life of Jesus," by A. T. Robertson"; "Canon and Text of the New Testament," a new volume in the International Theological Library, by Prof. Caspar René Gregory; "The Messages of Jesus according to John," by Prof. James S. Riggs; "A Short History of the Egyptians," by Prof. James Henry Breasted; and "Source Book of Ancient Philosophy," by Prof. Charles M. Bakewell. The volumes to be added to the Original Narratives of Early American History are "Narratives of Early Virginia," edited by President L. G. Tyler of the College of William and Mary; "Bradford's History of Plymouth Plantation," edited by the Hon. W. T. Davis; "Winthrop's Journal," edited by J. K. Hosmer; and "Johnson's Wonder-Working Providence of Sion's Savior in New England," edited by Dr. J. F. Jameson. Among Scribner's illustrated books are "Holland Sketches," by Edward Penfield; "The Arabian Nights," rewritten by Lawrence Housman; "American Birds," photographed and studied from life, by William Lovell Finley; "The Matterhorn," translated from the Italian of Guido Rey by J. E. C. Eaton; and "Pioneer Explorations and High Climbing in the Mustagh Range," by William Hunter Workman and Fanny Bullock Workman. Under the heading of fiction are Edith Wharton's "Fruit of the Tree," F. Hopkinson Smith's "The Romance of an Old-Fashioned Gentleman," Prof. Henry van Dyke's "Days Off," A. E. W. Mason's "The Broken Road," Josephine Daskam Bacon's "The Domestic Adventurers," and Thomas Nelson Page's "Under the Crust." Scribner will also import "Napoleon in Egypt and the Egyptians of To-day," by Hajji A. Browne; "Rural Nooks Round London," by Charles G. Harper; "Venice on Foot," by Col. H. A. Douglas; "Studies in History and Criticism," by Prof. Pasquale Villari; and "The Life of Louis XI.," by Christopher Hare.

Houghton, Mifflin & Co.'s fall announcement list includes "The Familiar Letters of James Howell." In two volumes, with an Introduction by Miss Agnes Repplier; Thomas Hood's ballad, "Faithless Nelly Gray," with amusing illustrations by Robert Seaver; two volumes in the Hart, Schaffner & Marx series of prize essays in economics, "The Causes of the Panic of 1893," by William Jett Lauck, and "Industrial Education," by Harlow S. Person; Part i. of vol. ii. of Charles Sprague Sargent's "Trees and Shrubs"; a new series of popular poets, in leather binding, at popular prices, including Longfellow, Tennyson, Whittier, Emerson, Aldrich, Holmes, Lowell, Hart, and Sill; "The Old Peabody Pew," by Kate Douglas Wiggin; "Camping and Tramping with Roosevelt," by John Burroughs; and an autobiography by Gen. Morris Schaff. The last-mentioned book will consist of a revision and enlargement of the papers which Gen. Schaff has been contributing to the *Atlantic Monthly* under the title, "The Spirit of Old West Point."

The fall announcement list of John W. Luce & Co. of Boston includes an illustrated holiday edition of Longfellow's "Wooing of Hiawatha"; for children, "A Guide to Fairyland," by Dion Clayton Calthrop; "A Perfect Strength," a volume of poetry selected by Emily A. Maynadier; "Love Songs and Lyrics," by Jessie A. Middleton; Fogazzaro's "The Politician," translated by G. Mantellini; Petrarch's "On the Death of Madonna Laura," rendered into English by Agnes Tobin; "The Father," a tragedy by August Strinberg, translated by N. Erichsen; "From Carpathian to Pindus," by Tereza Stratilesco, a study of the Rumanian peasantry, with maps and illustrations; and "Friedrich Nietzche, His Philosophy," by Henry L. Mencken. The same firm is the American agent for the King's Classics, published in England by Chatto & Windus. This is a library of masterpieces of English literature, under the editorship of Israel Gollancz. Thirty-five titles are now ready and forty more are in preparation.

The Revell Company announces "God's Message to the Soul," the six lectures which Dr. John Watson ("Ian Maclaren") delivered in this country just before his death. The same firm will issue the "Rhodes Esperanto Dictionary," which is described as a large and comprehensive work.

Paul Elder & Co., in connection with Sisley's of London, are about to publish a handy volume series of standard works under the general title of the Panel Books. Twenty volumes will be ready in September, including "Don Juan," "Silas Marner," "Cranford," "Oliver Twist," "The Devil on Two Sticks," "Wuthering Heights," "Idylls of the King," "The Black Tulip," "The Maxims of Napoleon," the "Confessions" of Rousseau, Daudet's "Sapho," the Life of Beau Nash, Sheridan's Plays, Tales from the Decameron, "A Sentimental Journey," and Nelson's Letters to Lady Hamilton.

"The Quest of the Colonial" is the title of a book by Robert and Elizabeth Shackleton, to be published in the autumn by the Century Company. The authors record their experiences in searching for old furniture, brass, and china. The company also has in hand for fall publication Kellogg Durland's "The Red Reign," the story of a year's

travel, adventure, and observation in Russia. It is to be illustrated with over sixty photographs.

The following additions to the World's Classics are announced by Henry Frowde as on the eve of publication: Butler's "Analogy," edited by Mr. Gladstone; Cervantes's "Don Quixote" (Jervas's translation in two volumes), edited by J. Fitzmaurice Kelly; Smollett's "Travels through France and Italy," with introduction by T. Seccombe; Fielding's "Journal of a Voyage to Lisbon," with introduction and notes by Austin Dobson; and the first volume of the copyright reprints of Ruskin (Ruskin House editions, by an arrangement with George Allen), consisting of "Sesame and Lilies" and "The Ethics of the Dust." Galt's "Annals of the Parish" will be added to the Oxford Library of Prose and Poetry, and Dr. Todhunter's translation into English verse of Heine's "Buch der Lieder" will be issued in the Oxford Library of Translations. Palgrave's "Golden Treasury," with no fewer than one hundred additional poems (to the end of the nineteenth century), is being published by Frowde in the Oxford editions of Standard Authors. The whole of Fitzgerald's version of Omar Khayyám is given.

"Hymns Every Child Should Know," edited by Dolores Bacon, will be issued next month by Doubleday, Page & Co.

L. C. Page & Co. will add to their Travel Lovers' Library two volumes on Umbrian cities by A. M. and J. W. Cruickshank.

The Italian-American Directory Company of New York is preparing to issue in six large volumes, copiously illustrated, "The Catholic Church in the United States of America." The work is to appear in both English and Italian, in the early part of the coming year.

The next volume in Dr. J. Scott Keltie's Story of Exploration series will be "The Search for the Western Sea," by Lawrence J. Burpee, which the English publisher, Alston Rivers, expects to bring out in October. Mr. Burpee's book will appear in a more elaborate form than any of the preceding volumes. It will be a small quarto, with a number of special maps and about sixty illustrations, including some views of old trading forts never before published. The field covered in "The Search for the Western Sea" is that immense parallelogram forming Northwestern America, and Mr. Burpee's subject is the story of western exploration, with the long quest for a water or overland route to the Western Sea. Special arrangements are being made for a Canadian as well as an American edition of the book.

The *Century Magazine* for September contains an instalment of extracts from Horace Traubel's daily record of conversations with Walt Whitman in his old age at Camden, N. J.

Thomas Y. Crowell & Co. have just issued five small but clearly printed volumes of Thoreau: "Excursions," with a biographical sketch by Ralph Waldo Emerson; The Maine Woods," and "Cape Cod," with introduction by Annie Russell Marble; "Walden," with an introduction by Charles G. D. Roberts; and "A Week on the Concord and Merrimack Rivers," with an introduction by N. H. Dole.

From Lemcke & Buechner come four volumes in the tiny, yet clearly printed, Bibliotheca Romanica: Prevost's "Manon Lescaut," De Castro's "Las Mocedades del Cid." Dante's "Vita Nuova," and Villon's "Œuvres."

The Library of Congress announces a second issue of its "List of Works Relating to Railroads." This is a reprint of the list issued in 1904, with the addition of a "Select List of Recent Works Relating to Government Regulation and Government Ownership of Railroads," and the continuation of the articles in periodicals down to 1907. In this reprint are introduced some works showing the operation of government ownership in foreign countries both from a critical and a favorable standpoint. The agitation of recent years for government regulation brought forth a great body of writing, mostly published in periodicals. The present issue lists quite exhaustively these contributions to periodicals, and the select list of books gives a clue to the representative literature on both sides of the question. The legislation which resulted in the Interstate Commerce law of 1906 is represented in the Government documents listed. The List is mainly concerned with material in the Library of Congress on railroads in the United States in their economic and political relations. It embodies treatises on the theory and history of railroad combinations, governmental investigations, speeches in Congress, and reports on interstate commerce, with references to some judicial decisions. The Appendix is devoted to the Northern Securities case. The prefatory note calls special attention to the most important works on transportation, railroad combinations, and pooling, the farmer and the railroad, and legislation.

E. P. Dutton & Co. have reissued in a second edition the late Herbert C. Fyfe's "Submarine Warfare, Past and Present," revised by John Leyland. There is little to add to our notice of the first edition (1902) of this interesting and useful book. The Whitehead torpedo, in the meanwhile, has gained both speed and range, so that the later forms make over thirty knots for 2,000 yards, and are deemed effective weapons up to 4,000 yards. The submarine has increased steadily in size from the nineteen-tons of the Holland No. 3 to 800-tons in the latest French types. The additional speed thus secured, while still greatly inferior to that of the battleship, has been purchased at the cost of celerity of manœuvre, just as the porpoise is quicker than the whale. Practically no improvement has been made in the periscope by which the operator can see what is going on above the water. Subject to blurring spray, and to accident, it is yet his only means of vision when submerged. The submarine must come to the surface now and again to sight its quarry, and the latter must remain nearly stationary, else contact cannot ensue. Nevertheless, as discouraging close blockade and fostering, on the part of the non-combatant citizen, a sense of security against the enemy's naval attack, who shall say that the submarine is without value? Mr. Leyland's two chapters on "The Relative Value and Powers of Submarines" and "The Morality of Submarine Warfare" are up to date and very readable.

A popular book, "Costume: Fanciful, Historical, and Theatrical," compiled by Mrs. Aria and illustrated by Percy Anderson, is published by the Macmillan Company. Mr. Anderson has contributed sixteen full-page color-plates and perhaps three times as many text pictures, large and small. They are arranged, in a general way, chronologically from antiquity to the nineteenth century, and then, with a fresh start, according to the geographical disposition of the peasant costumes, the Oriental dresses, and finally the exceptional phenomena of festival dress and modern costuming. The text follows nearly the same disposition, although no special pains are taken to describe the plates in the text or to illustrate the text by the plates. The costume called the Seville Orange is a suggestive dress enough, and there is a word about it on p. 180, but this is followed by a "Botticelli dancing dress," in which one detects no special reason for the proper name, and concerning which we find no verbal explanation. Croatian peasant dresses, Greek nineteenth century costumes, and the Albanian dress for women and children are given in chapter xi., without—it may be said—an example of the Greek citizen's dress with the starched white kilt, the fustanella, but nowhere is there any explanation of the separate garments, their make and their material, how they are worn, and how they are washed. In short, the book is not a treatise on costume, nor is it of any historical authority; but it may be found suggestive. It may assist a lady to select a costume suitable to her style and to the occasion.

Excellent reproductions of some of the more interesting finds in ancient Babylonia and Assyria may be found in Dr. Albert T. Clay's "Light on the Old Testament from Babel" (The Sunday School Times Co.). The text, however, displays a vicious teudency to minimize the changes of opinion in the field of Hebrew history and religion made necessary by recent discoveries, and to gloss over the similarities and magnify the differences between Babylonian conceptions and those of the Biblical narrative. The statement that the resemblances of the Babylonian creation story and Genesis I. are "not remarkable, for we should expect them to occur in any two stories of the creation that might be written, although from entirely different quarters, and having absolutely no connection with each other," is quite too much for one's patience. Dr. Clay concludes similarly in regard to the deluge narrative that "it is not necessary to hold with certain Assyriologists that the Biblical writer must have had the Babylonian version before him," and from the parallels of the code of Hammurabi with the Mosaic laws he can conclude only "that the similarity of those laws must be ascribed to similar conditions which would give rise to them, no matter how far the one people was removed from the influence of the other." It is difficult to see how one can arrive at such conclusions.

The arguments pro and con regarding the authenticity and historical trustworthiness of the Gospel of John are stated with admirable clearness, conciseness, and impartiality by the Rev. Henry Latimer Jackson, B, D., Vicar of St. Mary's with St. Benedict's, Huntingdon, in "The Fourth

Gospel and Some Recent German Criticism" (G. P. Putnam's Sons). The author has evidently kept himself thoroughly informed on all phases of the debate over what Soltau calls "das Hauptproblem aller Bibel-Kritik," and he has taken great pains to be accurate and fair in presenting both sides of the question. His temper is conservative, and he is inclined to think that the Gospel was "probably" written by an eye-witness, who may "possibly" have been the son of Zebedee. On the other hand, the large subjective element in the Fourth Gospel, and its very free portrayal of both the acts and the teaching of Jesus, are frankly admitted. Mr. Jackson has opened up the question for English readers in an admirable spirit, and with far truer appreciation of the real problem than has been the case hitherto. The book is a valuable supplement to Ernest F. Scott's essay on the theology of the Fourth Gospel, which was recently noted in these columns, and which we observe has been pronounced by Holtzmann "the most complete treatment of the Johannean theology that the new century has produced."

It is an encouraging sign of the times to find a good text-book in ethics suitable for use in secondary schools. "Everyday Ethics," by Mrs. Ella Lyman Cabot (Henry Holt & Co.), has evidently been prepared with as much care and thoroughness as if the demand made of American high schools that they teach youth how to keep the commandments and behave were as insistent as the clamor for courses in commercial bookkeeping, and "How to Know the Song Birds." The problems of philosophical ethics are, of course, left to one side, since the author has in mind pupils from thirteen to eighteen, but such moral questions as are likely to be vital to high school youth are treated with clearness of principle and aptness of illustration. The success of the author in finding examples from real life is a chief merit of the book. A "Teacher's Guide" affords useful suggestions as to methods in teaching ethics, the difficulty of which is recognized, and also references to literature.

It is noteworthy that the most Biblical of Bible lands, Palestine itself, is practically the last to become the object of systematic work at the hands of the archæologist. While the Nile valley has for a hundred years and more, and the Tigris-Euphrates valley has for fully half that time, been thoroughly searched for the remains of the ancient civilization, it has been only about eight or ten years since the Turkish Government has given the necessary firman to do this work in Palestine also. It is equally noteworthy that the different nations of the West have harmoniously coöperated in this work, especially the Germans, Austrians, English, French, and Americans. An excellent account of what has been accomplished is found in the recent work of P. Hughnes Vincent, "Canaan d'après l'exploration réccnte" (Paris: Victor Lecoffre). The Germans have been engaged chiefly near Mt. Carmel, under direction of Professor Sellin of Vienna, and more recently have begun work on the ruins of old Jericho, in immediate charge of Prof. G. Dalman. Dr. Bliss and Prof. Flinders Petrie have investigated historic sites in the southwestern parts of Palestine; and the chief result of the work has been the demonstration of the fact that civilization and culture did not begin in Palestine with the advent of the Israelites; but that, antedating this period, an older type of civilization, chiefly along Babylonian lines, was widely spread in this historic land. Strata reaching back centuries before the era of Joshua have been found, even a few cuneiform inscriptions, proving still more fully what had already been seen from the Tel-el-Amarna letters, that in pre-Mosaic times the Babylonian was the international language of diplomacy throughout western Asia and northeastern Africa.

"Ignis Ardens: Pio X. e la Corte Pontifica" (Milan: Treves) in most respects is the regulation anonymous biography, but it speaks no evil of its victim. With a superfluity of gossip, apart from the theme, it even succeeds in giving a convincing likeness of the apostolic figure in the Vatican. We see him shattering the immemorial etiquette of the Pontificate, chatting in his dear Venetian dialect with peasant pilgrims from the Veneto, eluding his custodians in order to stroll in the Vatican gardens without an equipage and an escort—in general so scandalizing the officialdom of which he is the head that he and his young secretary find themselves almost as isolated as a captain in a mutinous ship. All this is told with some exaggeration, but truly in the main. The book abounds in amusing anecdotes of "Papa Sarto," but the abiding impression is a sad one. The struggle between the brute inertia of the Curia and the geniality and simple piety of the Pope is too evidently an unequal one. Furthermore these qualities, admirable in themselves, are a sorry substitute for statesmanship, and of this indispensable accompaniment it appears that the Pope has little. To be a reincarnation of the fisherman Peter, with the world for one's parish, is a beautiful ideal, but it has no relation with the hard realities of the administration of the Roman establishment. Throughout the conclave Cardinal Sarto honestly begged his colleagues to spare him the burden of the tiara. His struggle with the difficulties of his high office, his constant foible of treating complicated situations as if they were simple, show how well he knew his own limitations. No one can read this book without profound sympathy for the genial and devout soul thrust unwillingly into the murky labyrinth of Vaticanism.

An important contribution to the bibliography of fifteenth-century literature has recently been issued by Dr. Isak Collijn of the University Library of Upsala, under the title of "Katalog der Inkunabeln der Kgl. Universitäts-Bibliothek zu Uppsala." It is the second volume to appear in the series of catalogues of incunabula in Swedish libraries, which this diligent bibliographer has in preparation. Its greatest value lies in the authoritative descriptions, here for the first time given, of more than 320 incunabula not fully described in previous bibliographies. The remainder of the 1,528 books catalogued by Dr. Collijn have received only short entries, with references to bibliographies of Hain, Proctor, and others. The catalogue has further the distinction of being one of the first, if not the first of considerable proportions to make use of Habler's Typenrepertorium. The titles are arranged alphabetically by authors and titles, with geographical index. An interesting feature is the list of previous owners, especially interesting in the case of a library enriched by Gustavus Adolphus with spoils from his Polish and German wars. Among well-known men whose ex-libris are found in the volumes enumerated in this catalogue, Copernicus should be mentioned; sixteen incunabula from his library came to Upsala with the chapter library of Frauensburg. In several of them are found manuscript notes in the astronomer's own hand.

The late Cultus Minister of Prussia, Dr. von Studt, now succeeded by Dr. Holle, just before giving up his portfolio inaugurated a complete reorganization in the management of the Royal Library in Berlin and of all the university libraries in the kingdom. He placed them all under a common library council, called Bibliotheksrat. The chairman of this body is the general director of the Royal Library, Professor Adolf Harnack of the University of Berlin, and the other members are four specialists in library matters, already selected by the minister, together with a sixth member, representing the Government. This new council has not final power, but is an advisory body. All decisions of the minister in reference to these libraries will pass through the hands of the council.

The New Yory State Library Asociation will hold its annual meeting at Stamford, Delaware County, the last week in September. The general theme is to be the place of the library in our educational system. The principal features of the programme are as follows:

"The Library and the Normal School," by Mary W. Plummer.
"Instruction in Library Economy in Normal Schools," by Ida M. Mendenhall.
Address on the general theme, by Mr. A. S. Downing.
"Libraries in the Public Schools of Manhattan," by C. G. Leland.
"Work of the New York Public Library for the Schools," by Mrs. A. J. Denley.
"Work of the State Library for Library Extension," by E. H. Anderson.
"Some Recent Books of an Interesting Type," by A. E. Bostwick.
"The Physical Care of Books," by Cedric Chivers.

In recent years the meeting of this association has asumed an importance, both in size and representative character, second only to that of the national association, and in view of the fact that the national meeting this year was at such a distance that few librarians from this State could attend, an unusually large attendance is expected.

Dr. Henry de Beltgens Gibbins, recently appointed Principal of Bishop's College, Lennoxville, Canada, died August 13 in England. He was born in 1865, and educated at Oxford. He was author of "The Industrial History of England," 1890; "The History of Commerce in Europe," 1891; "English Social Reformers," 1892; "British Commerce and Colonies," 1893; "Industry in England," 1896; "The English People in the Nineteenth Century," 1898; "Industrial and Commercial Progress of the Nineteenth Century," 1901, and "Economics of Commerce," 1905.

The recent death of the Icelandic poet and scholar, Benedikt Gröndal, at the age

of eighty-one years, removes a rather picturesque figure from the Icelandic literary horizon. Although a son of the famous Icelandic philologist Sveinbjörn Egilsson, Gröndal devoted his early life to the study of natural sciences and philosophy, later turning his attention to philological research. His best known work, the one that will doubtless live the longest, is his "Clavis poetica antiquae linguae septentrionalis," a systematic key to the periphrases employed in old Icelandic poetry, based on and forming a kind of cross-reference index to his father's famous "Lexicon Poeticum." Gröndal was a lyric poet of considerable force and merit, and it is characteristic of the manysidedness which life in a small community produces that he was also a first-rate designer, and the chief calligrapher of the island.

STUDIES IN HISTORY.

The Union Cause in Kentucky, 1860-1865. By Capt. Thomas Speed, Adjutant Twelfth Kentucky Infantry, etc. New York: G. P. Putnam's Sons. $2.50 net.

No part of the story of the Civil War deserves to be studied more attentively than the record of the conduct of the Border States from 1861 to 1865. That Missouri, Kentucky, West Virginia, and Maryland remained, in general, true to the Union, was a factor vital to Northern success. It was no doubt due to Abraham Lincoln, in the main, that these States were held to their allegiance, and in no point of his policy was his wise statesmanship more in evidence than here. But even Lincoln could have done nothing had there not been in each Border State a body of Unionists in a high degree bold and devoted. The sufferings and perils of the Border States were far in excess of those in States farther North. Not only were they scenes of conflict between the regular forces of the two combatants, but they were also constantly harried by the irregular warfare of guerrillas.

It is of especial importance that this story of the Border States should be fully and truly told; and with the conviction that the whole case has not yet been presented, Capt. Speed, a Kentucky Union soldier, belonging to a family famous as the particular friends of Lincoln, has written this book. Its value and correctness are vouched for by Justice John M. Harlan, of the United States Supreme Court, in a cordial introduction, and it will be found useful by all who desire to understand the Civil War thoroughly. Though Capt. Speed has written other books, he has some things to learn as to bookmaking. The absence of an index is provoking; there is sometimes an introduction of irrelevant matter. Why should an entire chapter be given to a discussion of the comparative sizes of the Union and Confederate armies in general? The book does not tell a consecutive story, but is rather a not altogether well-assorted collection of fragments relating to men and events, sometimes only locally interesting. The information given, however, is often important; the reader becomes well aware that the author was a patriotic man, deeply involved in all that he describes; and that he has the worthy purpose to put in its proper light the heroism of loyal men whose work and worth have until now been inadequately celebrated.

Capt. Speed is, apparently not without reason, dissatisfied with the picture of Kentucky Unionism painted by previous historians. Among his predecessors is one man of great distinction, the late Prof. Nathaniel S. Shaler of Harvard, who once wrote a history of his native State, Kentucky. Shaler was a loyal Unionist and a good soldier, but, in Speed's idea, he quite overshoots the mark in assigning merits to his foes. With an excess of candor he exalts the character of the Kentuckians who took the Southern side. Speed rejects the assertion that the "blue-grass country," the finest region of Kentucky, and the seat of the best population, went for the most part with the South, while sympathy for the North prevailed mainly among the inferior population established upon "thinner soils." He shows elaborately that the quality both of Union leaders, and also of the rank and file, ought not to be belittled in any disparaging comparison. Though men like Albert Sidney Johnston, John C. Breckenridge, J. B. Hood, and Simon Buckner stood for the South, they weigh no more, contends Speed, than the Union champions, Robert J. Breckenridge, the Crittendens, father and son; James Speed, Benjamin H. Bristow, Thomas J. Wood, and Joseph Holt. Comparing regiment with regiment, the Kentucky troops in the Confederate service showed no valor or devotion not paralleled by their brethren who fought for the Union. Among the Border States, Kentucky, perhaps, through its position and character, counted for most, and Capt. Speed's book helps one much in gaining a correct idea of its attitude and service.

The Mecklenburg Declaration of Independence. By William Henry Hoyt. New York: G. P. Putnam's Sons. $2.50 net.

That a convention of "good people" of Mecklenburg County, N. C., met on May 20, 1775, and declared their independence of Great Britain in the language employed by Jefferson in the Declaration of July, 1776, constitutes the basis for the claim of the so-called Mecklenburg Declaration to historical notice. For nearly a century the claim has been discussed, and sporadic investigation has produced little result, except to leave a reasonable doubt and increase the bitterness of controversy. Local pride has fathered much evidence in favor of the convention, even to a list of the delegates, and has drawn extraordinary conclusions from that evidence. Jefferson becomes a plagiarist, his friends resort to dishonest methods to hide his theft, vital evidence is destroyed with deliberation, and a person who questions the authenticity of the Declaration had best keep away from North Carolina, where memorials in stone and bronze have been erected to perpetuate that alleged document and the memory of the framers.

Mr. Hoyt's book may be accepted as the final word on the subject. He began the study, believing that some of the reasons urged in favor of the Declaration were valid, but the results of his investigation destroy all the claims in its favor. Step by step he traces the origin of the "myth," its development, and the various stages through which it has passed in the ninety years of its existence. He has gone back to original sources, reproduces and analyzes the earliest manuscripts, and carefully applies historical tests to them. The details thus marshalled in regular sequence are so often self-contradictory that it seems strange the "myth" should have persisted as it has. No historian of note ever accepted it, but no amount of writing has convinced North Carolinians that their assertions in favor of the Declaration required stronger evidence and a better interpretation of that evidence. Even John Adams and Jefferson, when they first saw the alleged Declaration, at once recognized the weak point in the absence of contemporary evidence of either convention or its important manifesto. To this day not a line of such evidence has been produced. A sentence in a dispatch from the colonial Governor, and a general phrase in two or three letters of the day, have been used to bolster up the Declaration. Later proofs were based on the affidavits of very old men, on manufactured papers, and on garbled extracts.

No one denies that on May 31, 1775, a county convention at Mecklenburg did frame resolutions such as almost every county and town throughout the colonies were framing. They expressed discontent with ministerial measures and threatened action to obtain redress. All the real evidence used to favor a meeting on May 20 applies with equal force to the meeting of May 31, and Mr. Hoyt's summation of his studies is that the assumed resolutions of May 20 were but a "distorted record of a true manifesto of Mecklenburg County, clothed in language wholly different from that of the true manifesto, conceived in the imperfect memory of John McKevitt Alexander, and written twenty-five years after its alleged date." The book offers a very good example of an historical investigation, conducted in a judicial spirit, and carries conviction with its conclusions. The illustrations are excellent, but nothing can excuse the absence of an index.

CURRENT FICTION.

Darry's Awakening. By Dr. Helen Bouchier. New York: Frederick Warne & Co.

The fate of Anglo-Indian children, more or less misused and misunderstood by relatives at home, has possessed unflagging interest, from the time of Harry and Laura, in Holiday House, to the tragedy of Mr. Kipling's Dick and Maisie. Like Clive Newcome, Harriet Manners ("Darry") has a father in India (but hers is a bad man), and, with three cousins, she is brought up by a family of elderly, repressed Scotch people.

Aunt Rhoda plays Mrs. Crabtree's rôle of tyrant, but times have changed! No taws, no dark closet! Her worst act is to eliminate the tinned salmon from an olla podrida of mixed sardines, jams, jellies, cakes, junket, and other dainties, with which the cousins propose regaling their guests at an authorized child's party. After such a piece of despotism, the young people (and strange to say, the author) consider all "grown-ups" fair game. By the time Darry is eighteen, her sweet, frank disposition has been so warped that she becomes past mistress in every kind of deceit. All the

while, however, she succeeds in preserving a high-hred girlish innocence which permits her to accept a casual diamond necklace from the young Rajah of her father's district (this is after Earnest Manners takes his daughter back to India). Mr. Manners soon proves himself just one more unreasonahle tyrant; he makes her return the jewels. Upon this, Darry concludes that she must do violence to her native candor and keep him unenlightened about all minor matters—such as her engagement to a youth who seems only introduced to be cruelly slain (by cobra hite) at a rest house, where he and Darry have stopped on the night of their elopement. On emerging from the consequent brain fever, Darry listlessly marries the man of her father's choice. Although she has shown aversion to Mr. Cunningham by every possible means, and pointedly refused him, this perfect gentleman remains convinced of her love for him. Needless to say, there is the happiest kind of ending, with that sort of after-marriage courtship which has won so many friends for the Maître des Forges and the Duchess.

This might have been an innocuous hook for girls just turning up their pigtails, had not the author apparently helieved Darry's truthfulness justifiably wrecked for life hy the tinned salmon.

The Younger Set. By Robert W. Chambers. New York: D. Appleton & Co.

On the first page of Mr. Chambers's fluent novel Austin Gerard tosses up and catches a "glittering gold piece—souvenir of the directors' meeting which he had just left." On the second page "the boy nodded, and, drawing a gold matchbox from his waistcoat pocket, lighted his cigarette." The note which is thus struck with unmistakahle clearness at the very heginning continues resonant to the very end throughout a full symphony of dinner parties, self-sacrifice, power-hoat races, automatic elevators in new houses on upper Fifth Avenue, hridge, and hroken hearts in the tonneaus of imported motor cars. Nobody in the book has less than seven or eight thousand a year, and even the hero, Capt. Selwyn, is not poor in the ordinary sense. But he, too, towards the end, invents a terrifically effective gunpowder which the Government accepts after a prolonged test at Sandy Hook. This makes it necessary for Capt. Selwyn to take the Wall Street flyer to Sandy Hook every day.

Once only does the reality of privation enter Mr. Chambers's Phæacian pages, and that is when Capt. Selwyn's runaway wife whom he had allowed to ohtain a divorce on grounds destructive to his own character and career in the army, is abandoned hy her second husband while she is in the incipient stages of paresis. Selwyn places her in a villa with two trained nurses, a phaeton, and any numher of consulting physicians, and with hothouse grapes at two dollars a pound. As a result Selwyn is compelled to surrender his apartments, previously described as of Spartan simplicity and costing possibly eight dollars a week, for a hall hedroom costing that sum per month. Yet it would seem that the saving effected would scarcely count, in view of the enormous expense attached to that hospital villa on Long Island. However, on the last page he wins the wondrously beautiful heiress whose father and mother were directors of the American School of Archæology in Crete.

Pilgrimage. By C. E. Lawrence. New York: E. P. Dutton & Co.

The theme of "Pilgrimage" is a variant upon the ever fruitful one which has given us "Sintram," "Ahdallah and the Four-Leaved Clover," "Everyman"—the whole literature of mystical self-conquest.

Peruel, an angel of the Army of the Lost, seeks reëntrance into heaven. Being given a chance, through the influence of Azrael, he hecomes incarnate as a foundling baby in a country called Argovie. There he grows up as Luke, swineherd to the monastery of St. Dunstan, where the situation between some of the friars vividly recalls Browning's "Soliloquy of the Spanish Cloister." The entire book is devoted to Luke's spiritual struggles, his persecution by bigoted monks, by outlaws, and men at arms. He is beset by recurring moral crises, devils hover about him, voices in the air reassure him. He ends, triumphant, a leper in a lazar house. The story is quite serious, including the theological discussions upon the incompatibility of divine love and divine injustice; and it satisfactorily proves that a certain vague mediæval setting, however trying in some respects, is after all better fitted to the struggles of personal devils and angels than the contemporary staging so fashionable in novels of this mystical cast.

Bachelor Betty. By Winnifred James. New York: E. P. Dutton & Co.

This is an undeniahly entertaining hook in the genre of Mrs. Everard Cotes (when she was Sarah Jeannette Duncan), or the early days of Kate Douglass Wiggin's Penelope.

Coming from Australia, Betty might he twin sister to one of Miss Miriam Michelson's hreezy heroines. She rents a hachelor apartment in London and promptly acquires that throng of admirers which traditionally helongs to all young ladies who tell their soul's history in the first person. In other words, the framework of the story is perfectly hanal. What redeems it entirely from the commonplace, however, is the author's lively turn of phrase and fresh, untrammelled observation. Moreover, under thé froth of Betty's beaux and Betty's silk stockings, there is a serious attempt to picture the Australian temperament. But this effort is never allowed to he ponderous, witness the chapter where Betty reads an earnest analysis of Australian characteristics to a gathering of her fellow country people, and the humor of their outraged comments. Her view of the London dog of society (. . ."I am still rigid with astonishment at some of the things I have been learning about their private lives") tallies amusingly with certain recent English satire, such as Mr. Galsworthy's, upon the national attitude towards pets. Her snap shots are extremely happy, as the description of Mrs. Carlton Smyth, who ". . . looked like Queen Elizabeth on one of her bad days."

After relishing Betty's sallies, her racy Australian vernacular and high animal spirits, it seems the depth of ingratitude to notice that she appears to be a grossly material young person, and to confess that, if this represents the average Australian, it may not he without just cause that the old country occasionally finds the new one a trifle—common!

The Smiths. By Keble Howard. New York: McClure, Phillips & Co.

In "The Smiths," Kehle Howard shows a touching faith in the day of small things. Only think, what a spell Mrs. Gaskell threw over the trivialities of Cranford, and with what humhle material Jane Austen wove her masterpieccs! Consequently nothing can be too simple for the truly human-hearted novelist. One small point, however, has here been overlooked. Every one does not happen to he born Jane Austen or Mrs. Gaskell. Therefore, the record of two honest young people who marry on a small income and lead the uninspired life of the solid British middle class, may he quite as tiresome in print as it appears in its suburban villa. In treatment, "The Smiths" hark back at least to the eighteen-fifties. So old-fashioned a hook has not been written in years. The mother-in-law joke (quite free from rejuvenating touches) furnishes much of the humor, and even the satisfaction of seeing perils averted—hahy George's fever, Ralph's flyer in stocks—is denied the reader, since the most inexperienced person must see at a glance that from the very outset, "The Smiths" are hooked for a happy ending.

Devota. By Augusta Evans Wilson. New York: G. W. Dillingham & Co.

Miss Josephine Daskam once pointed out that successive generations of little hoys and girls habitually cried their eyes out over "St. Elmo." Inquiry at any circulating lihrary overwhelmingly confirms this fact. Without having read "St. Elmo," one may safely assert that not even an ornamental horder on every page, and illustrations of preternatural loveliness will quite bring "Devota" the vogue of its predecessor. It is the kind of story in which, on page one, the hostess says: "Tell Hansel to take the dog cart to the station . . . . the trap and the victoria are in the hands of the fishing party." The lady is an elegant talker! On page fifteen, she tells how "Fellow passengers shunned us as if we were lepers, and only the surgeon ventured to assist in caring for the stricken child." After this, no one will he surprised at the proud heroine's eventually surrendering with. . . "Roy, my own Roy, I am not worthy, but the world is empty and desolate for me without the love of my life."

The Human Element in the Gospels: A Commentary on the Synoptic Narrative. By George Salmon. Edited hy Newport J. D. White. New York: E. P. Dutton & Co. $4.50 net.

A pathetic interest attaches to this volume of the late Provost of Trinity College, Dublin. It consists of notes, apparently constructed lahoriously through a period of years in the writer's old age, of whose value and prohahle fate he was himself in doubt as he penned the Introduction in which his conclusions are emhodied. Evidently the work was hrought as nearly to

completion as the author's capacity allowed, for the major part is from a second and revised draft of notes. Dr. Salmon's problem was the relation of the first three gospels to one another, and to possible documentary sources. Working at this intricate question year after year through his old age, he copied in fair Greek script the entire text of the synoptic gospels, as far as they run parallel to each other, and he ingenuously recommends this labor to students. The larger part of the volume reproduces this parallel Greek text, in small sections, with Dr. Salmon's comments on indications of priority, interdependence, mutual use of common sources, and whatever might tend in any manner to solve the problem of the literary origin of the gospels. The work is therefore an essay in the higher criticism, and not a commentary in the usual sense.

On reading the editor's Preface and the author's Introduction, one is prepared for somewhat radical departures from the usual attitude toward the evangelic narrative. The expectation is created that a scholar known for caution and conservatism will be found in his old age, in a volume published after his death, to have gone over to the opposite critical school. Dr. Salmon seems to have felt sincerely, and somewhat sorrowfully, that he had been forced to something like a revolution from his early views. However that may be, the text and conclusions of the essay itself will not afford satisfaction to even the mildest appetite for heresy and radical opinion. The most that this treatise has to advance is that much time has been wasted on verbal comparison of one gospel with another, since both may be free renderings of a common original, and that where different evangelists narrate the same occurrence, they are not to be forced into agreement, but choice must be made as to which narrative is the more probable, preference being given to the account most in harmony with our ordinary experience. Such a conclusion can scarcely be called radical, or even startlingly new. It is something, however, that a man of the cautious spirit and unquestioned learning of George Salmon was willing to maintain it.

The theory of the literary origin of the synoptics here advanced is somewhat different from that now most widely current. Instead of holding Mark to be one of the sources of Matthew and Luke, Dr. Salmon finds evidence of a common source of all three, which he entitles Q, contending that Mark abridged this source in many places. The phenomena are more simply accounted for on the theory that Mark itself is the earliest source, that Matthew and Luke both had access to a collection of teachings of the Lord, and in addition each employed authorities unknown to the other. But whatever hypothesis may finally be established, the search for sources has put the question of the credibility of the record in a new light, and it is clear that the late Provost of Trinity gave his approval to the new point of view, after very patient, independent, and conscientious study, the results of which Canon White has done well to preserve.

Deutsche Literaturgeschichte. Von Alfred Biese. In zwei Bänden. New York: G. E. Stechert & Co.

Just why another popular history of German literature should be attempted in a field so preoccupied by Koenig and Leixner, and so closely following the appearance last year of Engel's "Geschichte," it is hard to say, but nevertheless the attempt has been made by Dr. Biese, and evidently as a labor of love. Professor Biese is not unknown to Americans, for so recently as 1905 there was published here his rather pretentious work, "The Development of the Feeling for Nature in the Middle Ages and Modern Times." Something of the same enthusiasm characterizing those essays marks the pages of volume i. of this history (the only volume issued, the second being promised for Christmas of this year), which deals with the origin of the German language and literature, and its development through the time of Herder. One gain effected at once over the histories previously named is the size and portability of the volume; for if there are few reproductions from manuscripts and title-pages, and few portraits compared to those making up the most important feature of Koenig and Leixner, there is compensation in a book that can be held out comfortably in one's hand, and this, too, although there are twice as many illustrations as adorn Engel's quarto pages.

This necessity for condensation has affected the style of the author; in 176 pages he disposes of the whole period prior to the *Volksepos*, or "Nibelungenlied," sketching rapidly the wandering German peoples and the growth of their hero-legends, the influence of early Christianity, and the assertion of Germanic forces. In the discussion of succeeding periods, Professor Biese's aim is apparently less to find new paths than to see that what is presented accords with the latest investigation of scholars. The student used to Scherer will miss the author's expression of himself; and yet, while there is perhaps less of human interest in Biese, there are touches sufficient of the philosopher and the artist, the philologist and the author, to afford even the advanced student a relish for the modest discussions of Luther, Gottsched, Klopstock, and others. The limitations of space prevent elaborate criticism, but there is a happy outlining of the work of Lessing, Wieland, and Herder, and a sufficient insight into the *Sturm und Drang* of their day.

As a "popular" history of German literature, the illustrations command immediate attention, especially since both Koenig and Leixner, in their voluminous collation of all kinds of portrait and autographic paraphernalia, have drawn so heavily on the treasures accessible. At first sight, the volume before us suffers through its plain half-tone reproductions of illuminated manuscripts, in comparison with both Koenig and Leixner, which offer in color, among other things, the Heidelberg MS. of "Walther von der Vogelweide" and "Das Wessobrunner Gebet." What value colors may have is shown also by a comparison of the Hartmann von Aue cut in Biese with that in Koenig, as well as the title-page of the "Faust" book of Johann Spies, in Ulm, issued in 1587. The half-tone has also degraded the impression of such old-time wood-cuts as the Strassburg portraits of Sebastian Brandt and Geiler von Keifersberg, so well reproduced in Koenig and Leixner. On the other hand, Professor Biese has secured a very interesting specimen from the text of Wolfram von Eschenbach's "Parzifal," a couple of curiously-illustrated drinking-songs, a facsimile of MS. D. of the "Nibelungenlied"—"Daz was in einen Ziten," etc.—and a new portrait of Luther, painted by Cranach in 1525, hitherto unpublished. Some excellent portraits—many from oils, instead of the conventional old engravings—of Gerhardt, Thomasius, Leibniz, Hagedorn, Bodmer Gellert and Claudius, as well as the Graff portraits of Wieland, Lessing, and Herder, add to the value of the volume. The study of Hans Sachs in his eighty-first year does not, however, suggest the mediæval flavor of the *Holzschnitt* by Hans Brosamer, carved in 1545, and although the portrait of Martin Opitz, photographed from the oil painting in the city library at Danzig, is much better than that in Leixner, it does not equal the copper plate made by Von Heyden in 1631.

Hunting Trips in North America. By F. C. Selous. New York: Charles Scribner's Sons. $5 net.

The author of this work is well known as a mighty hunter. His numerous books on Africa, which have gone through many editions, have won for him general fame as a naturalist, explorer, and sportsman. Bred in luxury, son of the chairman of the London Stock Exchange, Selous as a mere boy went out to Africa, and for years earned a good living as an elephant hunter. By his undaunted courage and his remarkable skill as a scout and explorer, he saved the situation for England in the well-known Matabele campaign. Moreover, there is one quality about all Selous's books which will win the attention of his readers: he is preëminently honest and sincere. There is no fine writing, no exaggeration; all his descriptions of adventures bear the hall-mark of truth. Though an excellent shot, he often confesses his misses and his failures. The present work on the big game of North America, while primarily a sportsman's book, will also be interesting to the general reader and the lover of nature from its admirable description of the habits of wild animals observed in their haunts by an intelligent naturalist. There are no less than sixty-five illustrations from photographs, some very good, others rather indifferent, but all interesting.

The first chapter goes over familiar ground, the hunting and shooting of some fine moose in central Canada. The rest of the book is divided between caribou hunting and exploring in Newfoundland, and very interesting accounts of trips to the Yukon and the little-known Macmillan River in northwestern Canada. Selous, as a born explorer, never cared to follow a beaten track, and in Newfoundland he laid out a line of his own into a part of the island never before trodden by the foot of a white man. Amidst these nameless lakes and vast barrens and mountains he found great herds of caribou. It is worth while to quote a characteristic

story of the fearlessness of these noble deer when undisturbed and unacquainted with man and his slaughtering gun:

While my men were bringing up the canoe, I walked three or four miles up the river. On my way I met a caribou doe and fawn coming down. At this point there was a space of about five or six yards of ground strewn with boulders and stones, between the running water and a high steep bank covered with dense forest. When I first saw the deer, they were about one hundred and fifty yards away, and as the wind was blowing down stream, they could not possibly scent me, so I sat down on a rock and waited for them. They came slowly along, picking their way among the stones, and every now and again halting to feed on the grass or the leaves of bushes growing on the bank. I sat in full view, about midway between the bank and the water, holding my rifle across my knee, and remained absolutely motionless. The doe never noticed me at all, and I am sure never for one moment imagined that I was not part of the stone on which I was sitting. She passed slowly between me and the bank, and at one time was certainly not four feet away from me. The fawn walked right on to me, and when its nose was almost touching my knees, I think must have smelt me, as it stopped and stood looking into my face with its nostrils twitching. Even when they got my wind they did not run, continually stopping and sniffing the wind and holding their absurd little tails cocked up.

One of the interesting subjects in this book is the comparisons made by the author of the several varieties of the North American caribou. Until recently, the finest specimen of the reindeer on this continent was Tarandus rangifer Terræ Novæ, the noble woodland caribou of Newfoundland. It must now, however, give way to the Osborne caribou, Tarandus rangifer Osborni, the great dark-necked caribou of the Rockies, whose distribution extends from the Cassiar Mountains of British Columbia to the Kenai Peninsula. The Osborne reindeer easily bears the palm both from its immense size and the elegance and beauty of its head and antlers. Selous had good sport in Newfoundland. He says of this almost unknown island, whose vast interior, larger than Ireland, is one great natural deer park:

I know of but one really wild country where big game is still plentiful, which can be quickly and easily reached, and where a shooting trip can be undertaken at a comparatively small cost, and that is the island of Newfoundland, while the trips to Newfoundland are comparatively easy and only involve a canoe journey up lakes and rivers with some hard walking.

Selous's expedition to the Yukon and the Macmillan River was quite a different affair—a long canoe journey of hundreds of miles and the climbing of mountains thousands of feet high. All this had to be gone through before the sportsman arrived on the real hunting grounds. The variety of game also in this far-away region is much greater than in Newfoundland. Moose, caribou, wild sheep, bears, and several varieties of wolves are all to be obtained by the daring and untiring sportsman. Poling upstream for hundreds of miles and climbing mountains six and seven thousand feet high is no work for the feather-bed hunter. Selous, though now past middle age, is, thanks to his rigidly temperate habits, able to do any amount of hard work, to carry a heavy pack all day, climb hills, and shoot straight. His experience among the great carihou of the Yukon seems a repetition of his adventures in Newfoundland. In these almost inaccessible regions of far northwestern Canada the deer were just as tame, evidently unacquainted with man. Selous seems to have had no difficulty whatever in getting his full number of fine heads of caribou. He found it harder to get good heads of moose. The complete failure was in the sheep hunting. Numbers of these most interesting animals were seen on the high mountains, but they were all ewes or lambs. One very rare specimen, the black wolf, was bagged, killed by a wonderful shot at four hundred yards.

The hardships undergone on these expeditions will not encourage wealthy lovers of ease to venture into these remote regions, but to all who are hardy and tough, like the author, who have the genuine sporting instinct strongly developed, this book will be an interesting and informing guide to Newfoundland and Northwest Canada. One last chapter is devoted to outfit, food, etc., all excellent practical hints.

A Historical Geography of the British Colonies. Edited by C. P. Lucas. Vol. vi. Australasia. By J. D. Rogers. Pp. ix., 308, 132. Oxford: The Clarendon Press.

The title and appearance of this little book and the fact that it is only one volume in a series which is intended to cover the historical geography of all the British Colonies, scarcely prepare the reader for the treat in store for him when he approaches Mr. Rogers's brilliant history of the Southern Continent and the islands of the Pacific. Mr. Rogers himself has apparently taken great delight in the writing of the book. Every page seems to he a labor of love, with its clever descriptions, witty allusions, apt quotations, Biblical and classical, and swift judgments of men, of policies, and of events.

Australian history had only just begun when the eighteenth century came to an end. But Mr. Rogers is not content with a history so devoid of roots in the past, and he gives a couple of pages at the opening of his volume to proving that Pliny, in the first century, had some accurate knowledge of Australia that could only have been obtained from travellers who had been there. Whether or not this thesis can be maintained, it is certain that Australia was absolutely unknown to civilized Europe until long after Pope Alexander VI. so generously gave half the unknown world to Spain, and the other half to Portugal. In the seventeenth century various expeditions, chiefly Dutch, did a little towards exploring the inhospitable coasts of Australia; and in the eighteenth the rivalry between France and England, which was so marked a feature of colonial history in America and India, also showed itself in the Pacific. Australian history, however, can scarcely be said to begin before the loss of the American colonies had closed one chapter of British colonial history; and in its first stages Australian history was more squalid than that of any other great British colony. New South Wales was colonized in 1788 simply as an overflow jail for the English criminal courts.

Mr. Rogers lays stress on two features of this phase of Australian history—features which may afford much comfort to genealogy hunters among Australian sons and daughters of—whatever in Australia corresponds to the American patriotic societies. First, few of these early and unwilling settlers were criminals in the present day significance of the word. Under the savage penal code of England in the later eighteenth and early nineteenth century, when there were one hundred and twenty-six capital crimes, the merest peccadillo was sufficient to earn a sentence of three or four years of transportation; and as there was no provision for repatriation, these convicts, when their sentences expired, settled down and formed, according to the evidence of King, the great governor, the most useful class in the new community. The second misconception swept away by Mr. Rogers is that many, if not most of the old families, if they examine their genealogies too closely, may discover some convict ancestor. Mr. Rogers points out that owing to the fewness of the women, whether convicts or free settlers, few of the ex-convicts were able to leave any families, and that except for the work they accomplished, the whole convict class practically disappeared, "amid the execration of those whom they had benefited."

Another point on which Mr. Rogers is at variance with the popular ideas of Australian history is the influence of the gold discoveries on population and industries in the early fifties. He declares:

A chapter might be written setting forth the effects which gold is supposed to have produced and did not produce upon Australian history. The belief that these successive gold rushes suspended industry still persists, yet figures prove that during the eight worst years Australian cattle, agricultural and wool exports doubled. . . . . Gold digging was a mere passing phase. The diggers were like gleaners, selfish, unskilled, and nomadic; but unlike gleaners they preceded the harvest, which required skill, coöperation, and settled industry. . . . At the end of the transition period, that is to say, about the end of the fifties, digging sank into insignificance, mining was one out of many Australian industries, and gold-hunting became a subordinate part of the general life of the community.

Biblical and classical allusions—much more correct than the average quotations by English members of Parliament on the floor of the House of Commons—abound throughout the volume; and if Mr. Rogers is a young man, as his book leads one to suppose, they offer a proof that the enrichment of the English language and English style from these two great sources does not altogether belong to a past or passing generation.

Making a Newspaper. By John L. Given. New York: Henry Holt & Co. $1.50 net.

Writing for the Press. By Robert Luce. Fifth Edition, Boston: Clipping Bureau. Press. $1.

There are so many sorts of newspapers in the United States and they are "made" in so many different ways and under such varying conditions that no book can describe the process to the entire satisfaction of the newspaper world itself. There have been many attempts, but all of them have been either quite academic or merely an account of the methods employed on the particular newspaper or newspapers with which the author is most familiar. Certainly the impossible task has never been so nearly accomplished as in Mr. Given's

"Making a Newspaper." To personal knowledge gained on a great New York daily, he has added an extensive study of methods and conditions in every part of the country. Mr. Given's style is clear and trenchant, his phrases well chosen, and the entire book is "good reading" for any one. There is probably not a newspaper man in the country but could find many things in it he did not know before, while the layman will discover that it opens up clearly before him a world hitherto confused.

Beginning with a general introductory chapter on "The American Newspaper," Mr. Given proceeds to explain the organization of the ordinary office, and then takes up consecutively the work not only of the various editorial and news-gathering departments of the paper, but of the business and mechanical branches as well. Chapters on "Qualifications for Journalism," "Preparing for Journalism," "Getting a Situation," and "The Prizes of Journalism" may prove of service to those looking forward to a journalistic career. They are unvarnished, sensible accounts of what is expected of a beginner, and what a beginner may expect if he persists long enough to become an old-timer. They are neither so golden as to mislead, nor so dark as to serve as a warning.

Of a very different character, but also valuable in its way, is Robert Luce's "Writing for the Press," which now appears in a fifth edition, largely rewritten. The book is a manual of instruction, rudimentary and advanced, for all sorts of writers for all sorts of publications, including in its scope not only composition and rhetoric but information on such subjects as copyright, the law of libel, proofreading, illustrating, and typography.

Science.

THE INTERNATIONAL ZOÖLOGICAL CONGRESS.

BOSTON, August 24.

The seventh meeting of the International Zoölogical Congress, held at the Harvard Medical School, August 19 to 24, was successful from every point of view. Six hundred and fifty members and delegates were registered, and over 300 papers and addresses were presented. All the important countries were represented by their foremost zoölogists, who will be fêted in New York, Philadelphia, and Washington during the coming weeks. President Alexander Agassiz in his opening address emphasized the new features which have come to characterize zoölogy—physiology and mathematics. He then outlined his three famous trips in the *Albatross*, and his studies on the coral reefs and marine fauna of the Pacific. When the regular sessions began, papers followed papers with bewildering rapidity, many of great importance and interest. The impossibility of hearing more than a little of these again made it clear that in such a congress the social intercourse and the friendships formed are the chief thing.

There were seven sections, and before each an address was given by some distinguished foreigner. Of the sections, that of Animal Behavior perhaps aroused greatest popular interest. S. J. Holmes of the University of Wisconsin advanced the theory that structure is dependent on movement, instancing the regeneration of part of a planarian, during which process it seems to pull itself into shape, the portion acting as the whole animal. After many ingenious experiments with regard to the effect of light on these same animals, Dr. L. J. Cole deduced the fact which may be of wide importance, that the reaction is not to the *direction*, but to the *intensity* of the light rays. Prof. H. S. Jennings of Johns Hopkins brought out some new and remarkable facts in regard to feeding and defensive reactions in a starfish. On the upper surface of a Pacific species are some 25,000 pedicellariæ, or tiny, clasping, beak-like organs. When touched by a crab or even a fish as large as itself, these tiny organs spring upward, hold fast to the crab or fish, and do not let go until the death of the creature, or until it is drawn around to the mouth as food. In righting itself and in freeing one of its arms from a rubber band, Professor Jennings believes that the starfish shows intelligent action, not mere trophism, or trial and error. This view, of course, aroused comment from the opposing school of Loeb's followers, but the point was ably defended.

Prof. A. G. Mayer of the Carnegie Institution's Marine Laboratory at Tortugas gave considerable additional data concerning the ever-interesting annual swarming and spawning of the palolo worm in the Gulf of Mexico, at sunrise, at the third quarter of the moon in midsummer. Experiments with large masses of worm-inhabited corals in tanks proved that tidal action is not a factor in bringing about the swarming, but moonlight is. The fact is inexplicable, yet the worms remain quiescent if kept in the dark, while even diffused moonlight will stimulate them at the proper time. If the eggs are accidentally liberated even six hours before the appointed time, they fail to become fertilized. Prof. B. G. Wilder of Cornell University told of a beetle which in a space of three minutes feigned death in two very different ways. When picked up in the hand, it drew in the antennæ and legs closely, feigning death and dropping helplessly to the floor. When seized by a tree toad, it instantly spread wide all its limbs, holding legs and antennæ out stiffly from the body, making of itself so inedible an object that it was promptly ejected by the toad, and walked away in safety.

Prof. F. H. Herrick of Western Reserve gave a detailed account of a careful study of a colony of herring gulls on the Maine coast. By living among them in a carefully concealed blind, he watched them at close range and found that each pair had its well-defined range or preserve bounded by logs or other marks, within which was the nest and regular feeding place. As long as the young remained within this little paddock they were safe, but as soon as they encroached upon a neighboring preserve they were driven back or killed. When the parent flies down to feed the young, it first picks up bits of grass and twigs and offers them to the young bird. This Professor Herrick regards as a kind of education, teaching the young gulls to pick up their food from the ground, for, until they can fly, they feed chiefly on insects.

One of the most notable addresses was by Sir John Murray of the classic "Challenger" expedition. He dwelt upon the wonderful advances made by Americans in oceanography. It is now known that there are ninety-one places in mid-ocean which are more than 3,000 fathoms in depth, while more than two-thirds of the Pacific is over two miles deep. Shallow submarine ridges are known which, like lofty terrestrial mountain ranges, offer absolute barriers to the dispersal of organisms. So cold are the Arctic and Antarctic Seas, and so slowly do life processes move in these regions, that the tiny animals dredged from the sea, which in the tropics are but a few days old, may in the cold frozen seas be ten or more years old. Thus the life cycles of animals there may be many times longer than in the tropics.

"The Problem of Organic Development: Facts and Theories" was the subject of the address of Prof. C. O. Whitman of the University of Chicago before the Section of General Zoölogy. A well-maintained point was that there is no real transference of inherited qualities, as each daughter cell is an *actual part* of the mother cell. Reviewing the three main theories of evolution now in the field, Professor Whitman holds that mutation stands for gaps and no bridges; that selection follows chance advantages and cannot explain useless structures; while the orthogenetic theory gives opportunity to trace past sequences of characters and to prophesy future development. It accounts for parallelisms occurring under radically different conditions.

The lecture room was packed to the doors during the address of Prof. Jacques Loeb of the University of California, on the "Chemical Character of Fertilization." The wonderfully close approach of his researches to actual origin of life gave to them deep interest. By immersing unfertilized eggs in a hypertonic sea-water, a process of oxidation is set up which actually inaugurates and successfully completes the process of normal fertilization. Prof. R. W. Tower of the American Museum of Natural History told of his success in producing a new type of beetle *rotundus* from a brood of normal *Septinotarsa decemlineata* by a change of 12 per cent. in the humidity of the environment. The widely important fact, however, was that the change began with a very slight difference in the young larva, which gradually increased until the apparent mutation of the adult form was reached. There was, contrary to the ideas of De Vries, *no discontinuity*. Variation is a process, not a product. Another address which aroused the enthusiasm of all was that given by Prof. W. Bateson of Cambridge University of England, on "Facts Limiting the Theory of Heredity." He announced that at last the differentiation of sex in the germ had been established as a fact, for he had discovered in the female eggs of an insect an extra chromosome which was lacking in the male eggs.

Prof. H. F. Osborn of Columbia delivered an address on "Evolution as it Appears to the Paleontologist," in which he enunciated some general laws of great significance. Starting with the very beginning of the life of an organism, there are four inseparable factors which interact on each other and influence the organism. These are heredity, ontogeny, environment, and selection. A change in any one of these factors produces a change in all. A paleontologist can never prove discontinuity owing to the

chance of the intervening links being undiscovered. One of the most interesting facts thus far established is the strange directional potentiality of evolution, as, if a fruit-eating monkey should become herbivorous, cusps would appear on the molars, the position of which could be foretold.

Prof. A. A. W. Hubrecht of the University of Utrecht addressed a section on the larval envelopes of vertebrate embryos, and laid stress on the remarkable similarity of the early stages of all vertebrates. The embryos of man and the hedgehog are especially alike.

Among other valuable papers were those by Prof. E. G. Spaulding on "Postulates and Results in Treating the Problem of Conduct"; Prof. J. E. Reighard of the University of Michigan, Prof. H. B. Ward of the University of Nebraska, on the distribution of parasites, and President D. S. Jordan of Stanford University on the value of systematic zoölogy.

Among The Century Company's educational issues this autumn will be a new and revised edition of Dr. Alexander Smith's "Laboratory Outlines of General Chemistry," prepared in collaboration with Dr. William J. Hale, of the University of Michigan.

A great many interesting facts are given by Profs. Otaki, Fujita, and Higurashi, in their beautifully illustrated work, "Fisbes of Japan, an account principally of Economic Species." This has been appearing serially in Tokio, and has recently reached completion. Only a certain number of species come within the scope of treatment, and these are not taken up systematically, but their ecology is considered with unusual thoroughness, accounts being given of distribution, habits, propagation, economic value, and modes of capture. The text is in both English and Japanese. As one among many other valuable food fish, the catch of tunny in 1899, amounted to 79,124,002 pounds valued at about $1,570,000. Most interesting of all and especially esteemed for the table is the ayu, or Japanese samlet (*Plecoglossus altivelis*), a kind of dwarf salmon with delicate flesh of delicious taste and odor when fried or broiled. This fish it is which furnishes the best sport with the captive fishing cormorants. Certain places in the province of Mino have been noted for this mode of fishing for over 2,500 years.

The title of H. Charlton Bastian's "Evolution of Life" (E. P. Dutton & Co.) is misleading, for instead of considering evolution on a wide scale, it is merely an elaborate and detailed attempt to prove the reality of archebiosis or spontaneous generation. The overwhelming evidence against such a theory leaves one with hardly an unbiassed mind to criticise a volume on the subject. It will suffice to state that Dr. Bastian claims that ordinary bacilli, as well as vibriones, cocci, streptococci, torulæ, and other germs of fungi, appear almost regularly in his plugged, experimental vessels after they have been heated for from ten to twenty minutes to temperatures ranging from 115 degrees to 130 degrees C. He then naïvely adds: "These organisms which we have seen to be living —which developed and multiplied—must, therefore, have been evolved *de novo*. What other answer is it possible to give?" With practically all the eminent bacteriologists of the world flatly denying such a postulate of spontaneous generation, we can only add, in deference to Dr. Bastian's evident sincerity, that his experiments must be at fault in some way; there is some loophole unguarded.

The third edition of Pyle's "Manual of Personal Hygiene" (Philadelphia: W. B. Saunders Co.); is enlarged by a section of ten pages on home gymnastics, one of fifty on domestic hygiene, and another of about thirty on "hydrotherapy, thermotherapy, and mechanotherapy" (tempting the uninitiated to do too much), and also on "first aid." Much of the new matter is good, but many of the suggestions are too vague for the readers for whom the book is intended. This is particularly the case with the discussion of foods, cellars, drainage, heating, and ventilation, where decidedly more definite explanations or descriptions are needed to make the work really helpful. The advice on the management of emergencies is in the main sound, but the use of the stomach pump requires far more explicit directions to make it safe or effective, and the treatment of poisoning by oxalic acid (p. 427) is confusingly inconsistent with that of the later list (p. 429). There is also a new glossary with no indication of the pronunciation and containing not a few superfluities. A glossary that, to give one example almost at random, defines "excrescence" and omits "fomites" fails of its purpose.

In "Practical Health" (The Metaphysical Publishing Co.), L. E. Whipple, "principal of the American School of Metaphysics," seeks to simplify the application of doctrines presented for some years past in several editions of his widely read "Mental Healing." The supremacy of mind, the influence of "images" for good or ill, the fact that "the healing power of genuine ideas, thus rightly applied with definite purpose, is irresistible" (p. 193), would seem to be the central doctrine of the book. Thought transference is accepted as essential to all systems of mental healing, and is held to exist "at least sub-consciously among all people," and to be common among animals as far down as fishes "of the larger type," and even among insects. While no one familiar with disease will doubt that the essentials of mental healing may bring relief or recovery in certain special cases, by no means infrequent, it is interesting to observe the attitude of the author and his school to the larger problems of human ills. This seems to be well indicated in a single paragraph (p. 52):

> The fact that the microbe is present together with a given disease has led to a supposition that it was the cause of that condition. This, followed by experiment, has led to the acceptance of the theory. If the experiments had been conducted under a different expectation of thought it is safe to say that the results would have been correspondingly different. In subconscious action the human mind can both make and destroy microbes and bacteria as easily as it can build and animate cells in the human body, or control the thinking of other men, acts which to-day no well-informed person will attempt to deny. Bacterial parasites are not the work of God, but the legitimate outcome of man's own destructive thought. He makes and *he* can destroy them all. It only requires a knowledge of the kind of thought which produces each species.

An international conference on plant hardiness and acclimatization will be held in this city on October 1-3, under the auspices of the Horticultural Society of New York.

Drama.

In the Mermaid Series (imported by Charles Scribner's Sons), volumes are in preparation containing plays of Lyly, Peele, Greene, Kyd, Goldsmith, Sheridan, and Bulwer. There will also be a volume of plays preceding Shakespeare.

To commemorate the two hundredth anniversary of the birth of the dramatist Goldoni, the Municipio of Venice has recently published a book, "Della Vita e dell' Arte di Carlo Goldoni." This volume reflects great credit upon the Istituto Veneto di Arti Grafiche, by which it was printed, but it will not win an authoritative position for Giuseppe Ortolani, by whom it was written. It is true that Goldoni's works have not yet been properly edited (though a limited commemorative edition is now well under way); nor have we accurate information as to Goldoni's manuscripts or the printed texts; but the author of this *Saggio storico* (whom difficulties of such a sort do not concern) has failed to avail himself of the materials at hand, and has written a book in which many good ideas occur as if by chance amid countless inaccuracies. The *indice* is merely a brief list of chapter-headings; there is no genuine index; and we are asked implicitly to take the author's word for whatever statement he may see fit to make. As G. G. Coulton has so vigorously said in his book "From St. Francis to Dante" (p. 9), whatever a writer's prepossessions may be, "he can count upon a sympathetic public of his own, and upon comparative immunity from criticism; since his separate blunders, unsupported by references, can be traced and exposed only with the greatest difficulty; and in the present state of public opinion, nobody thinks the worse of him for making the most sweeping statements without adequate documentary vouchers." This is a slight exaggeration, but Mr. Coulton's invective applies none the less to the author of the present book. It is easy enough, however, to point out some of the worst errors. For instance, Signor Ortolani declares (p. 18) that the mediæval stage had not strength enough to fecundate "either here [in Italy], or elsewhere, any masterpiece." The justifiable inference is that he had never heard of "Robin and Marion," or of "Maître Patelin" (either of which will bear comparison with any of Goldoni's comedies), or of "Everyman." The author's sketch of the Italian stage before Goldoni is the work of one who gallops by night because he is not wise enough to go deliberately by day. There is still room for an accurate study of the life and works of Carlo Goldoni.

A Society for the Suppression of Useless Knowledge would find a good field of activity in the "Goethe Jahrbuch," of which the twenty-eighth volume has just been issued. Gleaners have been active so long that little but straw remains to be raked up. Some kernels of wheat, however, may

be found in eacb of these volumes, of which Ludwig Geiger is the editor. Probably the most interesting of the newly discovered documents is a letter written shortly before the poet's death, addressed to a Prussian official. He writes:

Twenty years I was director of a theatre, and my efforts were rewarded with applause, . . . But this extended experience convinced me that perhaps no other business is so dependent on what the moment brings. . . . Everytbing is so uncertain and fleeting that one never knows up to the day, and the very hour, wbat one should decide to do.

Concerning the question of autbor's royalty he makes this sensible suggestion:

He should be allowed the full receipts of the third performance, and of all later repetitions a percentage. . . . In that way both sides have an advantage; the director gives a royalty only for plays that succeed, and it is the author's affair to gain tbe public favor at once and to retain it.

The "Jabrbuch" also contains some jottings made by Goethe for the continuance of his autobiography beyond the year in which it breaks off; they were discovered in the Weimar archives by Kurt Jahn.

Music.

Simple Counterpoint in Forty Lessons. By Friedrich J. Lehmann. G. Schirmer.

The Art of Counterpoint. By C. H. Kitson. Oxford: Clarendon Press.

Until about a thousand years ago, music was purely melodic. None of tbe ancient nations had what we call harmony—the deliberate sounding together of two or more tones of different pitch, other than the octave. Then came the crudest form of polyphony—the singing by monks of the same melody in parallel fourths or fiftbs. From this horrible practice was gradually developed the art of counterpoint—the free invention of counter-melodies to a given melody. The harmonies resulting from this interweaving of melodies were at first merely accidental, and it was not until several centuries later that harmony was aimed at for its own sake.

Although counterpoint thus antedates harmony, in modern courses of instruction the student of counterpoint is supposed to have previously mastered harmony. This is the case with Mr. Lehmann's book, which is also otherwise strictly conventional. He follows the antediluvian custom of classing major and minor thirds and sixths as "imperfect" consonances. However, in three- and four-part writing, he allows, "in certain ways" tbe unprepared seventh and ninth, and the six-four chord, which is really most kind. His volume was written primarily for the classes at the Oberlin Conservatory of Music, and tbe autbor claims for it that it affords more than the usual practice in combining species, which is true.

Dr. Kitson's "The Art of Counterpoint," we are pleased to say, is not one of the many treatises on tbat subject wbich are based on previous treatises. He is rigbt in maintaining that in tbese text books, theory has been built upon theory and personal bias, until tbe original musical basis has been forgotten, the result being a system of counterpoint which has little connection with the past and none with the present, containing a code of arbitrary rules which do not represent the technique of any period of musical art:

To pretend that such a system has a certain disciplinary value, implies a low view of the purpose of contrapuntal study. Moreover, a discipline which forbids the student to write wbat is correct both from a relative and an absolute point of view is illogical and useless. The true province of contrapuntal study is the attainment of tbe art of pure vocal part-writing.

This art reached its perfection in tbe works of Palestrina, and it is tbence that our author directly derives his rule. After making the student conversant with the five orders of counterpoint, he shows him how to study Palestrina for himself. As a matter of course, other composers are not ignored; on p. 230, *e. g.*, references are given to modern examples of eight-part work by Parry, Lloyd, Harwood, Bach, Wesley, Mendelssobn. The concluding paragraph of this scholarly book is worth quoting:

The counterpoint of Palestrina has formed the harmony of Bach; the counterpoint of Bach has enlarged tbe harmonic resource of the modern diatonic scbool. The counterpoint of tbis school has formed the harmony of Wagner, Dvorák, Elgar, and Strauss. In this way bas the unessential merged into the essential; and tbe student may await with interest further developments of tbis nature.

Those who regard music as a factor in national development will be glad to hear of the formation of a Welsh Folksong Society, for the collecting and preserving, and in some cases for the publishing of Welsh folksongs, carols, ballads, and tunes. The first meeting in connection with it was held at Carnarvon during tbe National Eisteddfod of 1906. It resulted in the appointment of a committee consisting of the two originators, Sir Harry Reichel of tbe Bangor University College, and A. P. Graves, the inventor of "Father O'Flynn"; Sir William Preece, the Right Hon. D. Lloyd George, M. P., etc., to draw up a constitution and rules, these to be submitted to the subscribers at tbe Swansea Eisteddfod this autumn. In the opinion of tbe founders of the society, the study of the native melodies may be expected not only to throw ligbt on the past of the Welsh people, and to help to maintain the continuity of its ideals and culture in tbe future, but also to be a starting-point for the creation of a national school of music. Just as Grieg breatbes the spirit of Norwegian folklore, Liszt of tbe Hungarian, and Villiers Stanford of the Irish, so a school of Welsh composers, if it is to have a vigorous life, must be based on the musical genius of the Cymry, as seen in the "Alaw Gymreig," sacred and secular. That the society aims at influencing Welsh education is sbown by the fact that, besides thirty-nine from the thirteen counties, the General Council is to include members appointed by the tbree University Colleges, the Eisteddfod Association, the National Union of Teachers, the Association of Headmasters of County Scbools, etc. Intending subscribers, five shillings per annum, honorary subscribers, ten and six, should communicate with the secretaries, J. Lloyd Williams and L. D. Jones, University College, Bangor. It is hoped that Welsbmen living in America will give help both by becoming members of the society, and by drawing on the memories of other settlers from the Principality. It is noteworthy tbat a large body of Irish music was collected from Irish emigrants by Mr. O'Neill, for many years the chief of police in Chicago.

During the opera season at Covent Garden, London, which closed late in July, Wagner and Puccini were as usual in the lead. Wagner had twenty performances, Puccini nineteen. Together they had thirty-nine of the eighty-five performances. Beside their works, the list contained "Traviata," "Cavalleria," "Pagliacci," "Rigoletto," "Hänsel and Gretel," "Bastien and Bastienne," "Aïda," "Lucia," "Carmen," "Ballo in Maschera," "Fédora," "Andrea Chénier," "Loreley," "Faust," "Merry Wives of Windsor."

Paris is to bave in addition to its two older opera houses, the Grand and the Comique, two more, the Théâtre Lyrique International and the Théâtre Lyrique Populaire. The Populaire is to have five hundred ten-cent seats. Tbe repertory will contain works of the French school cbiefly, such as "Dame Blanche," "Fra Diavolo," "Zampa," "La Juive," and "Le Propbète.

Art.

Glass. By Edward Dillon, pp. xxviii., 374. New York: G. P. Putnam's Sons. $6.75.

Tbis book is the latest addition to the Connoisseur's Library, that interesting series which we have treated in these columns on several occasions. Mr. Dillon has contributed one previous volume, the book on porcelain, 1904; and we have for purposes of comparison these two books by the same author, dealing with two branches of decorative art, one tbe best known and tbe other the least known of all. Ceramic art, if not porcelain properly so called, is the most generally popular among collectors, great and small, the most studied, and of all the arts of decoration the most sure to interest outsiders. Glass, however—who knows anything about glass? Who collects or studies or has studied the glass vessels of antiquity, of tbe middle ages, or even of modern times? Tbere are a few enthusiasts in this way, and any one of those will tell you that he finds but little admiration for his possessions and little sympathy for his pursuit.

The museums of Europe and some of tbose of America sbow great collections of glass found in graves on the Mediterranean sbore. Tbese pieces have one admirable quality, diversity of graceful form. They have one less artistic but equally interesting quality, the charm of unexpectedness in their simple metbods of added decoration. Tbus a glass vial found in an island of the sea, or one of those brougbt to market to-day, dug up from the sands of the Asiatic Levant, is adorned by the application of from two to eight or ten handles, useful or ornamental, and by purely ornamental zigzags and scrolls, all made of thin strips of glass pulled out and applied when hot. Others, again, have no adornment further than a thread of glass wound round stem, or neck, or body. Otbers, again, are modelled in relief, probably by having been blown in a mould, whose forms the hot glass takes very readily. Again some are

decorated in color by the application to a pale blue, grayish green, or wine-colored body, of strips of more vivid color. As a general thing these ancient glasses are thought precious for the beauty of their superficial iridescence; and the result of this preference is that the lover of the classical forms and of the purposed decoration of the pieces may often buy, cheaply enough, those vases which have not suffered that decay from which the iridescence comes. This matter has been well explained in the book before us; chapters iii. and iv., with plates vi. and vii., present the simple glass vessels which we have tried to describe very briefly, and treat of the iridescence, its cause and its nature. One is glad to see, as on pages 16 and 17, the complete examination of the changes which take place in a solid wall of glass, by means of which its surface becomes brilliantly colored indeed, but also soft and pasty. This curious process of decay would be less attractive, perhaps, if it were understood how much the nature of the material had changed in putting on the brilliant hues.

On the other hand, the mention of modern attempts at procuring that iridescence by technical means and without weakening the material, has received inadequate treatment. In the brief chapter on contemporary glass the fact of such imitation is mentioned, and is ascribed to "Messrs. Tiffany, the well-known goldsmiths of New York." The artist who actually introduced and still makes the Tiffany Favrile glass would be as much surprised to hear that statement of its origin as he would be disturbed at finding no mention at all of his other experiments in coloring surfaces. Not "artificial iridescence" alone, but a whole system of decorative coloring in waves, in zigzags and scrolls, in clouds and spots, makes up the chief beauty of the Favrile glass; and this has been successfully repeated, though on a smaller scale, in Vienna and Paris at least—undoubtedly in other European cities as well. Now this modern surface decoration is not of the greatest charm, because it is not placed on the vase or the bowl with deliberate care. It is left, as it were, to expand, and the surface is thought sufficiently adorned if the clouds and waves of color spread over it without much control. In these respects this glass is as different as possible from the enamelled; nor has the process anything to do with enamelling in the strict sense of the term. And yet as a fairly representative piece of nineteenth century decoration the Tiffany Favrile glass and the similar glass made in certain European capitals are important—that century had so little to show of independent and novel design in handicraft.

Very recent experiments in glass decoration have been but slightly touched upon in this work. The wonderful effects got by Rousseau of Paris in laying coat upon coat of varied colored glass and cutting through in the manner of cameo-engraving but with curious differences which cannot be described here; the admirable enamelling on cold, or finished, glass by Brocard of Paris, and others, a process familiar to some through the wonderful imitations of famous Saracenic mosque lamps, but also to be found in wholly modern pieces intended for modern uses; the beautiful drinking glasses which were exhibited in the Austrian department at the Paris exhibition of 1900, and which, as it appears, were brought to the United States—all of these are left without mention in this volume. Now, we cannot blame a book or a work of art for not being what it does not pretend to be, but a large volume with the general title "Glass," may be called to account if it gives no hint of the interesting things which are being done in our times. Rousseau, Brocard, and, in a way, Louis C. Tiffany have, indeed, been named in the brief final chapter, and with them Gallé of Nancy, and Cros, but nothing is said to tell the reader what is really attractive about their work.

Otherwise the book is what one might expect from a conscientious workman. One collector will be disappointed, another will be pleased. The writer of this review is distressed to find that Mr. Dillon has cared so little about the Roman glass with *fiori*, as the Venetians call them, flower-like scraps of color in the translucent body. That ware also has been copied in modern times, though feebly and with limited success. Those solid pieces, thick and heavy castings as they seem, have been accused by some students of being, in their conception, foreign to the true nature of glass. They are, indeed, very different in character from the light and delicate spun, twisted, and blown vessels which for twenty-five centuries have delighted mankind; but if glass is so metallic in its nature that it may be treated in that more ponderous as also in the lighter way, why should not this way be accepted as another fashion of treating decorative glass? The same question applies to the glass vessels which are made beautiful by their spirals and zig-zags in inlay of opaque glass of vivid colors, such as are given on plate ii. of Mr. Dillon's book. That also is an art which seems contrary to the true nature of the material; but so is enamelling upon glass. In the latter process you take the transparent vessel completely shaped, and apply to it ornaments of colored paste which might equally well have been put upon a body of metal or of porcelain. In this connection it is interesting to consider what the Chinese have done in glass, for they are fond of it as of an artificial stone, semi-precious, hard, of beautiful colors, and taking a high polish. Considering it in that way, as an artificial rival to jade and to crystal, they carve it into simple or complicated forms, and one is glad to see that plate xlix. of Mr. Dillon's book is devoted to those Far Eastern pieces.

There are forty-nine plates, many of them in color. The subjects are well chosen, with some apparent care to omit all well-known individual pieces, and even well-known types. The Index, though a dozen pages long, is far from complete. The student is so often surprised by meeting, in the text, with that which he has sought in vain in the Index, that he learns to work with the list of chapters and the list of illustrations, and to find his way by slow turning of the leaves.

In the Library of Art (imported by Charles Scribner's Sons) the volume "Rembrandt," by Prof. Baldwin Brown of Edinburgh will soon be ready. The new volume in the Langham series of art monographs is "Pompeii as an Art City," by E. V. Mayer.

The *Burlington Magazine* for August is largely given over to Claude, twenty-two of his drawings being reproduced, accompanied by an intelligent and pleasantly written analysis of his art by Roger E. Fry and notes on the individual drawings by C. J. H. In the result one finds Claude a more interesting and original artist than one had imagined him, many of the drawings having a surprisingly modern air as to both vision and handling. They show how much the Lorrainer could see and feel that he did not deem suitable for elaboration in his limited, if exquisite, manner. Of the other contents of the number, the most interesting is a reproduction of Van Dyck's portrait of the Marchesa Giovanni Battista Cattaneo, recently acquired by the National Gallery, a fine and sober work of the artist's Italian period, showing, so far as one may judge, little reminiscence of Rubens and nothing of his own later affectation. The section on Art in America is devoted to two Cassone fronts in the Jarvis collection at New Haven, written of by W. Rankin, and to an account, by Kenyon Cox, of the union of the National Academy of Design and the Society of American Artists and the consequent liberalization of the constitution of the Academy, concluding with an appeal for the increased gallery accommodation so urgently needed for the proper exhibition of the work of our artists.

In the course of preparation of one of his vast and comprehensive works, a "Repertoire de peintures," Salomon Reinach found himself the possessor of a number of photographs of pictures of different epochs, the reproduction of which in anything more than outline had been abandoned as impracticable for that publication. A number of these photographs he has now published, through Lévy et Fils, in a thin quarto, entitled "Tableaux inédits ou peu connus tirés de collections françaises." The fifty-six plates reproduce the complete compositions, and some parts of compositions on an enlarged scale, of forty-eight pictures of various schools, and of dates ranging from the fifteenth to the nineteenth century. Many of them have a real beauty, but almost all of them have an interest of mystery—they are ambiguous productions, possessing analogies with the work of more than one master, or even of more than one school—difficult to classify, therefore, and of uncertain attribution. In many cases one is inclined to think that the puzzle interested M. Reinach more than the picture, which does not of itself present any great charm or decided merit. In his notes he is, as was to be expected, admirably lucid, and quite impartial, giving all the facts, and stating all the difficulties, hazarding a conjecture now and then, but rarely drawing a definite conclusion. The phototype plates are not all equally well executed, but most of them are at least passable. Plate xiv., however, is very poor, and it may be the fault of the reproduction, rather than that of the original, which inclines us to doubt the attribution of this Portrait of a Man to Rembrandt.

In 1896, the Macmillans brought out, in

three heavy volumes, a translation of Richard Muther's "History of Modern Painting," the most elaborate and generally useful history of painting in the nineteenth century. Now E. P. Dutton & Co. give us, in four lighter volumes, the same translation, revised by the author, and brought down to the end of the century. The revision includes omission as well as addition and rearrangement, and certain rather long-winded passages which have been excised will hardly be missed. But it is in its illustration that the new edition differs most widely from the old. This has been done entirely anew, not only as to execution, but, often, as to choice of examples. There are probably fewer illustrations in the present volumes, but they are generally larger, and, almost invariably, better done. One of the innovations is the inclusion of a considerable number of reproductions in color to which we cannot give very high praise. On the whole, however, the book is improved in its new dress.

The latest issue of the *Mitteilungen* (No. 33) of the German Orientgesellschaft is a richly illustrated report of the archæological researches in the society's two great fields of operation, Assyria-Babylonia and Egypt. Near the city walls of Assur, Dr. W. Andrae has discovered the historic New Year's Festival House, which was erected by King Senharrib after the destruction of Babylon in 689 B. C., for the glorification of the Assyrian national divinity. This structure, so famous in ancient times, turns out to be highly important for our knowledge of Assyrian architecture. In Babylon the investigations were conducted by the chief of the expedition, Professor Koldewey, who has an exceptionally huge pile of ruins to deal with. His most interesting find has been a building from the period of Artaxerxes, ornamented with many colored enamelled brick. In Egypt the society has continued its researches in the pyramid field of Abusir er-Rirah, near Cairo, and can report among other things a group of large and beautiful reliefs from the fifth dynasty. The full account of the society's excavations at the pyramid and the temple of King Ne-user-re, in so far as they belong to the old kingdom, has now been published by Hinrichs of Leipzig, as the seventh volume of the Scientific Reports of the Orient Society, prepared by the leader of the Egyptian expedition, Professor Ludwig Borchardt.

On the east side of the Theseion in Athens, one of the best preserved temples of antiquity, the Greek Archæological Society has undertaken excavations for the purpose of laying bare the old Agora of the city. Foundation walls have already been found, which probably belonged to the *peribolos* of the temple, which evidently was similar to that of the temple of the Olympian Zeus in Athens. As soon as the surrounding land can be purchased, these excavations are to be continued. Dr. Dörpfeld is of the conviction that in this neighborhood the remnants of the Royal Hall will be found.

M. de Morgan, in his report of last winter's excavations at Susa, speaks of the discovery of numerous and important inscriptions concerning the history of Elam and Chaldea, "the cradle of our civilizations." Among the art objects there is an alabaster statue of King Manichtusu, with its date (4000 B.C.) practically authenticated by an inscription. There is also a superb specimen of painted ceramics of the same century, found at the depth of twenty-five metres amid the ruins. M. de Morgan believes this, with the ante-historic pottery of Egypt, to be the forerunner of the potter's art in Mediterranean countries.

The eighteenth annual exhibition of the New York Water-Color Club will be held in the galleries of the American Fine Arts Society, No. 215 West Fifty-seventh Street, November 2 to 24.

Finance.

REDUCTION OF A DIVIDEND.

The reduction of its semi-annual dividend by the Southern Railway, last Friday, was an incident in the rapidly unfolding financial situation which, for several reasons, has attracted particular attention. During all of the commotion of 1903, the important and reassuring fact was that no great railway gave any sign of financial weakness. Such dividend reductions as did occur in that period, fell almost exclusively in the ranks of industrial corporations which were recognized as experiments. The announcement therefore that this important railway, which has been paying five per cent. annually on its preferred stock since 1901, had reduced its rate to a three per cent. basis created some little consternation in the market. The news was followed, naturally, by another decline in prices, which seriously dampened the better feeling, which had developed on the markets during the previous week's pause in Stock Exchange liquidation.

Before passing judgment on the exact meaning of this reduction, and especially before drawing any conclusions as to whether further incidents of the sort are likely to follow, it will be necessary to examine the circumstances which led to it. In the first place, the action was not unexpected; in the second place it occurred, not as a consequence of declining revenues, but as a direct result of the existing peculiar conditions in the money market. In the fiscal year ending June 30, 1906, the Southern Railway, after paying the $3,000,000 called for by the five per cent. dividend on its preferred stock, reported a surplus of $2,229,000. In the fiscal year ending with last June, gross earnings were $3,016,000 greater than in the preceding twelve months, yet operating expenses increased so heavily that net receipts actually decreased $1,909,000. This decrease in net income was, it will be seen, nearly enough to offset the surplus which had existed the previous year, before payment of the dividend. When it is added that the year's payments for interest and rentals were $1,400,000 above those of the fiscal year 1906, it is plain that, in the present year, the five per cent. dividend simply was not earned. Even after the cut of last Friday, which reduced the payment for the whole past year to four per cent.—the full semi-annual rate having been paid last April—a deficit is left after paying the dividend just declared. The balance available for dividends, after paying expenses and interest, was $2,209,000, against $5,229,000 the year before, and a four per cent. dividend called for $2,400,000. A full year's dividend, at the three per cent. rate now established, would have left a moderate surplus.

Why should net earnings have fallen in this way, when gross receipts were mounting so handsomely, and when transportation rates have been maintained? The answer lies mainly in the fact that the company found itself confronted with the need of large expenditure to keep its tracks, stations, and rolling stock in order—this at a time when the money market simply refused to take new securities on reasonable terms. The result of this deadlock of credit was that the Southern Railway did what any prudent company would have done—it appropriated unusually large sums from current income to provide the money for improvements. For instance, the increase in expenditures on tracks, as compared with a year before, was $537,000, and on equipment $987,000; while to this had to be added the enormous increase of $3,130,000 in what railway men call "cost of conducting transportation"—this increase being chiefly attributable to the rise in wages. In announcing their dividend reduction, the directors gave out a formal statement that they "were influenced by consideration that the income account for the year reflects such abnormal and extraordinary conditions as may not reasonably be expected to recur." On this point there will be rather general agreement. That the present blockade of credit facilities cannot possibly last indefinitely, all experienced financiers believe. Mere accumulation of new capital will settle it in time. But the matter of higher wages, at a moment when the price of the finished product—in this case transportation—cannot be raised proportionately, is one of the formidable problems brought before the whole community by the present abnormal economic situation.

When, however, one comes to the larger question whether the Southern Railway incident is or is not likely to foreshadow similar occurrences, one may answer without great difficulty. There are doubtless some railways which, like the Southern, have been handicapped by lack of working capital, and by the poor condition into which their plant had been allowed to fall before the enterprise was established or reorganized. The Southern Railway is a salvage from one of the numerous wrecks of 1893—wrecks which involved not only companies whose financial weakness has been more or less continuous, but also railways of such present enormous strength as the Union and the Northern Pacific. Such companies as those last mentioned had the double advantage of being organized at a time when they could be so adequately capitalized as to start with a well-filled purse, and of running through a country where the movement of material prosperity during the decade past has been most decided. The Southern Railway was reorganized in 1894, before markets were fairly on their feet again; it comprised in itself a group of exceedingly ill-equipped and run-down lines, traversing a section which was the last to reap the benefits of the prolonged industrial

boom. The result was that provision for expenditure on plant was ill-made at the start, and that the need for such expenditure was greater than in most other companies of its size. But the very facts here reviewed go to show that the case of the company is by no means a fair measure of conditions in American railways generally. The majority of the greater companies have been able, during the period of prosperity, to make such provision for the future, in the way of accumulated surplus and expenditure on the line, as would easily avert even such moderate embarrassment as has been suffered by the Southern.

As to the relation of the Southern Railway's action to the market as a whole, investors need be reminded that the reduction of a corporation dividend, especially when made for temporary causes, may at times be not only prudent in itself, but may be distinctly reassuring as a sign that the management is taking no risks in a doubtful crisis. Ideas occasionally grow confused among people who look at railways from the point of view of Stock Exchange quotations and the investment list. One need, however, only ask what would be thought of a manufacturer who, when his company was short of money and improvements were immediately needed in the plant, should go on paying a maximum dividend while borrowing at extortionate prices on his notes, or while letting his property deteriorate. Nothing is commoner among private business men than reduction of such annual distribution for exactly the purposes announced by the Southern Railway.

Nor can it safely be assumed that this particular reduction, even if it were to be followed by some others, would have any serious meaning to the financial future. There need only be recalled such episodes, in the similar stringency of 1903, as the entire cutting-off of the dividend on United States Steel common stock, the abandonment for a year of the 7 per cent. dividend on Republic Steel, for two years of the 4 per cent. dividend on the American Car and Foundry, and the cutting in two of dividends on half a dozen other important companies. In these very cases, the United States Steel has restored one-half of the dividend then abandoned; the Republic Steel has in recent years not only resumed its old rate of payment, but has paid back all previous shortages from the original 7 per cent. rate; while most of the others are paying at the same rate as prior to 1903. Meantime, the general situation, far from having been injured by the prudent action of these companies, was greatly strengthened by it, and the companies placed in a position where they were able thereafter to look forward with equanimity to another financial storm.

BOOKS OF THE WEEK.

Abbott, David P. Behind the Scenes with Mediums. Chicago: Open Court Publishing Co.
Adams, Samuel. The Writings of. Edited by Harry A. Cushing. Vol. III. Putnams. $5.

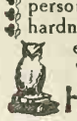
Miss May Sinclair's First New Novel Since "The Divine Fire."

THE HELPMATE

$1.50

This is the very human story of a young married couple and their friends. Perhaps its keynote is struck where the husband thinks his wife "too perfect to be the helpmate of his imperfections." The tale makes a moving plea for tolerance and sympathy.

"A noteworthy book. . . . There are things said in these pages and said very plainly which need to be said, which are rarely enough said—almost never so well said. The book contains unforgetable scenes, persons, phrases, and such a picture of the hardness of a good woman as exists nowhere else in our literature."—*New York Times Review.*



HENRY HOLT & CO. 29 W. 23d St. NEW YORK

Memoirs of Henry Villard

Journalist and Financier

1835-1900

Two volumes, with Portraits and Maps. $5.00 *net*. Postage, 35 cents.

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 5, 1907.

The Week.

Certain dark oracles were uttered by Vice-President Fairbanks at the Irrigation Congress in California on Monday. He referred to unnamed "doctrinaires" who are "encouraging commercial unrest," and mysteriously hinted that "unwise policies" might result in "arresting" business. He also dwelt upon "confidence," and warned his hearers against any rash man who should try to "undermine" it. Now, whom or what could the Vice-President have meant? If he had not expressly declared that he was not talking politics, we should have known what to suspect. If a Democrat had said these things, we should have understood the references. But it cannot be that things have come to such a pass that a Republican aspirant to the Presidency should even allude to Mr. Roosevelt as a "doctrinaire." The right to hurl that adjective is exclusively reserved to the President: to apply it to him, is almost as bad as calling him a nature-faker. Can it be that the "woolly horse" of Indiana is taking his revenge? Or has Taft's complete identification of himself with Roosevelt compelled Fairbanks to stand apart? One mistake the Vice-President certainly appears to have made. He said that we have "a surfeit of politics," and now need "more business and less politics." That will seem a hard doctrine in Indiana. There they eat, drink, and sleep politics.

Speaker Cannon's interview, published very widely last week, is worth the careful attention of every man who would know what chance the President has of obtaining from Congress the "more drastic" laws which he has declared to be necessary. As Speaker, which he surely will be again if he lives, he will have enormous power in shaping the legislative action of the House, and his ideas of what that should be he gives in words that cannot fail to be taken at Oyster Bay as a threat. Premising that the session of Congress beginning next December will fall at a critical time, both financially and politically, Speaker Cannon emits this warning note:

> If Congress does not act wisely at the next session; if it is not actuated by calmness and patriotism; if it makes great mistakes and fails to meet the approval of the reasoning American public, there will not be much need for the election of delegates to the next National Convention of the Republican party.

That may seem very general and orphic, but further on in the interview Mr. Cannon becomes more precise. "It would be a crime," he declares, "if Congress should do anything at this time to upset business." This might seem only an echo of the familiar cry of the lotus-eating tariff beneficiaries: "Let us alone." But that cannot be what the Speaker means this time. It has been generally agreed by high Republican authorities, including Lodge, Taft, and the President himself, that nothing shall be done about tariff revision either this year or next. So the "crime" which is troubling the spirit of Uncle Joe cannot be the laying of a sacrilegious hand upon the ark of the high tariff. The President's thoughts are all of making old laws more stringent, and getting new ones. And there can be little doubt that all this is clearly in the Speaker's mind when he says that Congress must give its strength to the passing of the appropriations, and refrain with a holy horror from making any of the "mistakes" which would upset business and the Republican party at the same time.

If additional evidence were wanted to disprove the "absolute necessity" of our fleet's presence in the Pacific, it may be had in the growing tale of Japan's difficulties and misfortunes. Her financial condition is serious, with taxation mounting to the maximum of endurance and the national credit showing signs of exhaustion in a period of tight money markets. The two years since the close of the war have been marked by a succession of internal disasters. The treaty of Portsmouth had scarcely been signed when news of the devastating famine in the northern provinces began to replace the bulletins of Japanese victories in Manchuria. Famine, at the present moment, is again threatening the country; Hakodate, laid low by fire, has 60,000 homeless sufferers; Tokio alone shelters 80,000 victims of recent floods. Much nearer home than San Francisco or the Philippines, Korea calls for attention on the part of the Government; and the increase of anti-Japanese feeling among the Europeans in China, not excluding the subjects of friendly and allied Great Britain, is a factor which any prudent government would consider before setting out to pick a new quarrel. Japan is now busy paying the price for her new dignity as a great Power, and, in all human reason, should have had enough of greatness for a while.

The desire for a Democrat who has "carried" some necessary Northern State is partly responsible for the mention of Lieut.-Gov. Chanler as a Presidential possibility. Thus we find that, while no one appears to have anything but a good word for "New York's dark horse," the real reason for his availability is contained in the figures which show how far he ran ahead of Hearst last fall. Democrats with qualifications of this sort did not figure to such a degree in the canvass of 1904. Parker's own sweep of New York State had been in an off-year, as far back as 1897. To-day there can be enlisted, if not a regiment, at least a good corporal's guard of Democrats who have won fights in the enemy's country. While New York has a Republican Governor with a complement of Democratic State officials, there are seven States in which the conditions are just reversed. Chamberlain of Oregon, Toole of Montana, Sparks of Nevada, Burke of North Dakota, Folk of Missouri, Johnson of Minnesota, and Higgins of Rhode Island all were elected in the face of opposition strong enough to carry all or part of the other State offices. The wonder is that with this unusual, if not unprecedented, condition, any Democrat can hold the view that there is only one available candidate, and he the twice-defeated Bryan.

In his attack on the courts at the Jamestown Exposition on Monday Mr. Gompers betrayed a one-sided habit of thought. As a labor leader, he was, of course, bound to rail at the writ of injunction, yet he gave strange reasons for his opposition. He said that it deprives "the laboring men of our country of their Constitutional guarantee, before the law; it is an indirect assertion of a property right in men when these men are workmen engaged in a lawful effort; it never was intended and never should be applied to deprive men of their personal rights or the right of man's ownership of himself." These objections, even granting that they were well founded, are precisely those which the non-union worker urges against the acts of the union. It deprives him of his liberty and tells him: "Your attempt to work in opposition to our fiat is unlawful. You do not own yourself; we own you."

The decline in the price of British consols, and the high rates paid by New York city for money, are two among many symptoms of the demand for new capital. One of the best evidences of its magnitude is afforded by the statistics, just made public by the British Board of Trade, of the organization of stock companies in Great Britain during the past twenty years. It appears that the number of "going" companies, after throwing out those which have disappeared as the result of incompetent or

dishonest management, increased from 10,494 in 1887 to 23,728 in 1897, and 43,038 in 1907. The increase in numbers, however, is less significant than the increase in amount of paid-up capital. This stood at £591,508,692 in 1887, £1,285,042,021 in 1897, and £2,061,010,586 in 1907. It would be misleading to interpret this remarkable increase as an accurate measure of the growth in industry. While such a growth is a factor in the increase in corporation capital, the larger part undoubtedly represents the conversion of private partnerships into joint-stock companies. British industrial enterprises, therefore, have appeared in the money market during the past twenty years with an average annual appeal for about £70,000,000 of new capital, the actual needs being probably larger in the last few years than in some of the earlier years. It is not surprising that with this demand for company capital encountering demands from the Government for about $800,000,000 in new consols and similar securities since 1898, there was sharp bidding for the supply in the market. Consols suffered in price, and rates for money rose. This acute demand for capital has not been limited to Great Britain. The computation which is made annually by *Le Moniteur des Intérêts Matériels* of the output of new securities throughout the world placed the amount of such issues in 1906, outside the United States, at $4,350,000,000, subject to reduction by refunding and conversion operations to about $2,500,000,000. If to this is added about $1,000,000,000 for the United States, the net new issues of 1906 stood at about $3,500,000,000. These figures in themselves are a sufficient explanation of the scarcity of capital at the present time, and the difficulty of floating new enterprises. Other influences may have accentuated the disturbance in the stock markets, especially in our own; but even very favorable political conditions would be incapable of calling out capital adequate for meeting recent demands.

The action of the Erie Railroad directors, in the matter of dividends on the stock, calls for a word of comment. The case of the Erie is in some respects similar to that of the Southern Railway, which recently reduced its semi-annual dividend from 2½ to 1½ per cent.; that is to say, in each case the company was capable of earning and paying its usual dividend, provided it could borrow on reasonable terms the money imperatively needed for work on road-bed and rolling stock. Unable thus to procure the money—which would have been a proper enough charge on capital account—the Southern used for the purpose so large a part of its actual revenues that the surplus left after paying interest charges was too small to provide for the usual dividend disbursement. The Erie actually earned a surplus large enough for the purpose, though this may conceivably have been because its appropriation from earnings for improvements was less liberal than the Southern's; but it was nevertheless equally confronted with the dilemma of providing for future expenditure on property. Rather than omit the dividend, or reduce it like the Southern, Erie's directors resorted to an old-time expedient whereby dividends at the previous rate are paid to shareholders, not in cash, but in "scrip" or "warrants," bearing 4 per cent. annual interest, and redeemable in cash ten years from now. This action, we think, is open to serious criticism. The fundamental fact is that the company is borrowing to pay dividends, and at an hour when use of credit ought to be cautious in the extreme. Even if the operation is conceded to be, as Wall Street describes it, a mere forced loan from the company's own shareholders, at a lower rate than the general money market grants, that does not alter the fact that Erie is going in debt unnecessarily, and is laying on its future resources a burden of $1,600,000—the amount of the dividends declared—in order to avoid the unpleasant duty of cutting down payments to the shareholders. The expedient is no doubt ingenious, but to test its validity, one need only ask what the consequences would be if all of the railways were to adopt it. The resulting situation would be as mischievous as absurd, and it could end only in the entanglement of railway finance and the discredit of the companies.

While Gov. Hughes is explaining in speeches his idea of regulating corporations through a Public Service Commission, that Commission itself is illustrating the method by action. The orders which it has just issued for the betterment of transit conditions in New York are to be put into effect only after a hearing. If the companies can show that the increase of cars and trains is physically impossible, then the orders will not be enforced. This is reasonable and fair to all concerned. Investigation has preceded the step now contemplated, and the traction managers are, out of abundant precaution, to be allowed to consider the matter, and to present their side of the case. Anybody can see how far superior this plan is to the old one of going to the Legislature to get separate bills passed for the relief of passenger traffic in this city. That meant a struggle at Albany over two or three measures, with more or less success, and then an end for a year of all attempts at improvement. To-day, however, we have a body continuously sitting, clothed with all the power of the Legislature in transit matters, and able to hear complaints, study remedies, and issue orders, year in and year out. There is promise in this of regulation that regulates.

In deciding to contest in the courts the power of the Public Service Commission to order the Interborough-Metropolitan to open its books, the lawyers of that corporation have acted after the manner of their kind. They see "a chance" that the law may be declared unconstitutional, or that it may be technically defective as regards a holding company, and so they are for a legal fight over the question. They may be right, from the professional point of view, but we are convinced that the course they advise is exceedingly unwise? If their contest reveal a flaw in the statute, the Legislature will be certain to mend it next winter. Should the whole measure be declared unconstitutional, we should say that an investigation by the Legislature of the whole unsavory past of the Metropolitan would surely follow. But leaving all these hazards out of the account, how mistaken and impossible is the policy of secrecy as respects a public-service corporation like this. Its future stability and success will depend almost wholly upon public confidence, and how can that be won if the accounts be concealed, and the impression given that the books will not bear inspection by the Commission? Absolute frankness and entire publicity are now the only course for such companies, and counsel who advise anything else give bad advice, no matter how "eminent" they may be.

Canada is fast taking rank with the Australasian Colonies of Great Britain as an almost hysterical champion of the "all-white continent" idea. The immigration of some two thousand Japanese in the course of a year has been sufficient to throw British Columbia into a fever of protest which is said to be quite as intense as our own San Francisco upheaval. The anti-Japanese agitation tends to assume more and more the character of an epidemic, since it is inconceivable that Canada, with her vast empty spaces, should so soon begin to protect herself by raising barriers against immigration. British Columbia has a population of less than half a person to the acre; it is admitted that the Japanese would be useful in connection with the extensive railway-building operations now under way; the country has not seriously felt the curse of Asiatic immigration; yet "there is a feeling among the inhabitants generally that there is a menace behind the movement." If the menace consists in the fact that, in view of Japan's prestige, Canada will not be able to avail herself of the Japanese laborer to a certain point and then turn upon him as we have done upon the Chinese, that may

be true. But as for his underbidding the white workingman, there is ample authority to show that the Oriental quickly learns to rise to the highest prevailing scale of wages. "There was a time," so runs the complaint, "when the white man and the Indian were employed in the fisheries of the Fraser River, but they have been crowded out by the Japanese." Since Canada is conceded to be enjoying uncommon prosperity and has no threatening idle class, this can only mean that the Japanese have crowded the white fisherman into more remunerative employment.

This is a day for giving thanks that we are not like our British cousins who tolerate a war secretary who buys 400,000 horseshoes in another country, for no other reason than that they are "satisfactory, both as regards price and efficiency.". If we let price and efficiency govern our buying, Heaven only knows what would become of our government contracts. But there is something uncommonly queer about Mr. Haldane's contemptible horseshoes. They were not made in any of the countries which on the maps of our protectionists are blocked out in the tint which stands for "pauper labor." In fact, they were made in the United States of America, where wages and the standard of living are higher than anywhere else in the world. Thus, after confessing by a tariff of one cent per pound that our own horseshoemakers are unable to withstand free competition with other nations, we see these same horseshoe-makers getting the business of a foreign government—which, more than a private customer, would give the benefit of every doubt to the English bidder—in the face of that same open competition. The product in question is not a large factor in the industrial world, yet there is one famous parable which begins with a horseshoe and a horseshoe nail and ends with the loss of a kingdom.

The passage of the Deceased Wife's Sister bill was sure to cause serious trouble in the Church of England. The Archbishop of Canterbury and the Bishop of London have forbidden their clergy to celebrate or recognize such marriages. On the other hand, the Assistant Bishop of Manchester takes a directly contrary view, holding that any kind of social or religious boycott of those who with a clear conscience take advantage of the amended law would be unjust. In case a clergyman of the Canterbury province disregarded the warning of the Archbishop, he would incur no penalty but a reprimand for performing a perfectly legal act. If, however he followed the Archbishop's advice, he would be within his rights, as no clergyman is bound to read the marriage service on demand. Yet it surely cannot help the Church to place herself deliberately in opposition to the law of the land. And if the refusal of some clergyman to perform a legal marriage ceremony should be brought to the attention of the Prime Minister, he might imitate the letter which Lord John Russell wrote to the Dean of Hereford, who had informed him that he would not vote for Dr. Hampden (accused of unorthodoxy) as Bishop. It ran:

> SIR: I have had the honor to receive your letter of the 22nd inst., in which you intimate to me your intention of violating the law. I have, etc.,
>
> J. RUSSELL.

An all-inclusive benignance irradiates the German Emperor's address to his Westphalian subjects at Münster. Catholics and Protestants, farmers and industrialists, workmen and burgesses are told that they are equal sharers in their monarch's affection and devoted service. There is no denouncing of selfish interests, no riding down of rebellious Social-Democrats. This a great change from the purple passion of less than two years ago, when the loosened sabre was constantly being rattled in its case, the powder was continually being reëxamined to make quite sure that it was dry, and Germany, like a man suffering from the mania of persecution, was everlastingly facing the world, "hand on hip, eyes straight to the front." The Emperor's new attitude is indicative of the general relaxation in the strain of European politics. The Continent seems to have awakened from an evil dream of plots and ambuscades, the bitter aftertaste, no doubt, of the war between Russia and Japan. Passions have subsided, and why should not the Kaiser grow affable? England, instead of being the arch-plotter of Germany's ruin, has recently shown, through her King, a desire to arrive at an amiable understanding. France, with her new problem of Morocco, can harbor no evil designs. The Social-Democrats have been beaten and, chastened by defeat, promised at their recent Congress to be good in the matter of rendering loyal military service.

A sharp controversy has been raging in the European press over the question whether Gambetta secretly visited Bismarck in 1878. Francis Laur, Gambetta's literary executor, has published an article asserting that he did, and giving details (rather vague, it must be admitted) of the conversation between the two statesmen. But he offers not a scrap of documentary proof. He is not even sure whether the interview took place at Friedrichsruh or at Varzin. This is rather disconcerting, especially in view of the fact that Bismarck never made the slightest reference in his reminiscences or letters to the visit of Gambetta, if it occurred, and that the minute Busch never mentioned it. Indeed, Count Herbert Bismarck did not know of the affair, and now roundly asserts that M. Laur is building upon nothing but conjecture. That Gambetta made several tours in Germany *incognito* was well known before. It is wholly possible that he may have passed through Friedrichsruh as one of many unknown travellers. But that he actually saw Bismarck and had a confidential three hours' talk with him, cannot yet be regarded as established. What M. Laur makes perfectly certain, however, is that Bismarck came to feel more kindly towards Gambetta, as towards the French republic, and that he would have welcomed a better understanding with France. To Gambetta's credit also must be set down the fact that he discarded the policy of implacable *revanche*, and saw the advantage of getting on good terms with Germany long before the possibility of such a thing was conceded by the vast majority of Frenchmen. On the other hand, M. Laur admits that Gambetta did not foresee at all the alliance with Russia, which was so soon to become the fixed policy and hope of France.

The anti-clerical agitation in Italy, while losing nothing in effectiveness, shows signs of recovery from the hysteria evoked by the charges brought against the Salesian brothers at Varazze and against religious institutions elsewhere. Over the testimony of the boy Besson, a pupil of the Salesians who has given circumstantial accounts of the most shocking practices in the Cloister School where he was a student, a warm controversy is now in full tilt. A part of the press, supported by the opinions of "experts," asserts that the lad is the victim of his own delusions and that his stories regarding the celebration of the Black Mass were derived from the edifying "revelations" of Leo Taxil. But the more respectable section of the radical press has gone on from the discussion of isolated scandals to urge a thorough investigation of all the institutions maintained by the Salesians in Italy. These are some eighty in number, and include academic institutions, trade and art schools, and printing establishments. The vows of poverty imposed by the founder of the order, Don Bosco, are, according to the *Vita* of Rome, flagrantly violated. High fees are charged to outside pupils, while poor boys, taken in by the brothers under the guise of charity, are in reality shamelessly exploited, being compelled to perform hard labor in return for the barest sustenance. From the printing-press of the order, continues the *Vita*, issue edifying works in which Jews are represented as cutting open the veins of helpless Christians and drinking their blood.

TWO YEARS OF THE LIBERALS.

The proroguing of Parliament invites to a taking of stock of the Liberal party, after two years in power. First, as to leaders, present and prospective—always the most interesting question in politics. How are the old men faring? What new men are coming forward? Of the Prime Minister, it must at least be said that he has held his own. Sir Henry Campbell-Bannerman was at first thought of as a mere stop-gap Premier; he has shown himself a unifying and directing force in his party, for whom it would be very hard to find a substitute. His bluff vigor, Scotch wariness, and personal kindliness have enhanced his authority. He is, however, well stricken in years, and his health is none of the firmest; so that he can scarcely be expected long to bear the burdens of the party leadership.

Next after him comes Mr. Asquith, the Chancellor of the Exchequer, a cool head and powerful debater; but there are both personal and political reasons why he could hardly be expected to succeed Sir Henry. Mr. Haldane, the War Minister, has shown marked ability, and has carried a bill for army reform through Parliament in a way greatly to heighten his prestige. But he is not thought of for the party leadership. No more is Mr. Birrell, who has filled two difficult offices and adorned them by witty and pregnant speech such as might have been expected from this lit'ry feller in politics. Mr. Morley has seemed almost buried in the India Office. Winston Churchill, on the contrary, has often been to the fore. His aggressive and somewhat bumptious manner, his hard hitting in debate—he is said to be the only Liberal who could stand up and give Chamberlain as good as he got from him—and his keen instinct for what is popular with the masses have given him the reputation of a man who has risen fast, but may easily go far. Another of the young men of great promise is Lewis Harcourt. He had charge of the land bill in the Commons, and conducted it to passage with such skill as to win praise from his adversaries. Lord Rosebery, as a brilliant free lance, has apparently taken himself out of the running. If the party leadership were now to fall vacant, Sir Edward Grey, the Foreign Secretary, would be preferred before him.

Turning to "measures, not men," there is necessarily a sense of disappointment in weighing Liberal achievement against Liberal hopes and promises. This, however, is nearly always the case when a party comes into power with a great majority. It expects to make all things new, but the tough old world refuses to be altered while you wait. The Liberals have had two peculiar difficulties in the way of carrying out their programme of legislation—the Lords and the Irish. The former have got in the way of educational and electoral and land reform; the latter have wrecked the Irish Councils bill. Yet a calm estimate of the whole legislative record would show a respectable balance in favor of the Liberals. They have been a working government. They have put through a large number of bills for legal and mercantile and social reform. Their land bill, though but a modest beginning, may prove epoch-making. And in the conduct of foreign affairs they have been eminently successful.

Trouble is plainly afoot in Ireland, but this will not necessarily mean disadvantage to the Liberals as a party. They have tried conciliation, but it has been rejected by the Nationalists; now if they are called upon to put down sedition, they will surely do it with firmness, and thereby rob the Tories of a favorite weapon. Nor is the lot of the Irish themselves altogether happy, except as they are happiest when in a turmoil. Mr. Redmond is having to defend himself from attacks in the rear. The new Sinn Fein party in Ireland speaks as bitterly of the Irish Nationalists as the latter do of the English. The tactics of the Sinn Fein movement, which appears to be making rapid headway, is to withdraw the Irish representation at Westminster altogether, as an idle farce which merely serves to keep certain politicians in office, paid out of the Irish Fund, and to set up a sort of National Council of the people's own in Ireland. This, of course, would be extra-legal, but its decisions might be binding on Irishmen. It is proposed, also, to establish tribunals for the settlement of civil disputes, leaving the English judges in Ireland with nothing to do; to encourage a sort of passive resistance to taxation; to keep Irishmen from enlisting in the army, or taking service on the police; to buy only articles of Irish production or manufacture, and, in a multitude of ways, to make Ireland look to herself instead of to England. By such means, the leaders of the Sinn Fein party argue, Hungary attained her national recognition, and wrested the *Ausgleich* from Austria. Something of that kind is aimed at for Ireland. It will scarcely come in that way, but the striving for it will mean great bitterness and disturbance among the Irish factions. The Liberals can afford to await the outcome.

A few months ago, the Conservatives were talking with great confidence of an early Liberal break-up and their own return to office. Of this less is heard recently. The Liberals have a good deal to show, and are going about the kingdom saying, with much plausibility, that they would have had much more had it not been for an obstructive Tory House of Lords. This looks like a good card, as may be seen by the nervousness which Mr. Balfour and Lord Lansdowne betray over its production. Furthermore, the swelling of the Socialist and Labor vote at bye-elections, if it means fresh demands upon the Liberals, bodes no good to the Conservatives. Hence the sober opinion of the cooler-headed Tories is that the Liberals are pretty sure to remain in power at least two years more.

SOCIALISM GROWING SOBER.

That Socialism is becoming conservative is a fair statement of the impression produced on the outside world by the International Congress which met at Stuttgart during the week of August 18-25. The practical spirit manifested in the resolutions adopted by some nine hundred delegates from all the six continents, is not an entirely new phenomenon in the Socialist movement, for it is no paradox to say that both the recent triumphs and recent defeats of the party have served to endow its leaders with a sense of responsibility that we are not accustomed to associate with the utterances of the extreme collectivist partisan. On the one hand, if Socialists feel convinced, as Eduard Bernstein declared at Stuttgart, that their "world-parliaments are becoming increasingly the arbiters of the casting vote," the pressure of practical considerations would act in the direction of a wise self-restraint. On the other hand, if the German Social Democrats, as frankly avowed by Bebel, have learned from this year's Reichstag elections that the spirit of nationality cannot be antagonized without serious consequences, that, too, would be a powerful argument for moderation. Evidently, the Socialists are discovering that like every other party or creed they must take public feeling seriously into account.

Of the questions which the Stuttgart Congress took under consideration, the four most important were anti-militarism, colonization, freedom of emigration and immigration, and the policy that should govern the relations between Socialists as a political party and the labor unions. The question of anti-militarism was of great importance to the French Socialists, whose ranks it has badly disorganized. Hervéism, as the movement is called in France after its most uncompromising exponent, teaches that it is the duty of the working class to make war impossible by all means in their power—refusal to serve in the army, insubordination, armed strike, and, in the case of the actual declaration of hostilities, by armed insurrection. The anti-militarist agitation has placed the French Socialist leaders in Parliament in an extremely difficult position. M. Jaurès has dared neither to break with Hervé because of the latter's powerful following, nor, for obvious reasons, openly to embrace his views. His attempts at compromise have not

been conspicuously successful, and the congress of French Socialists which met several weeks ago at Nancy adopted a resolution which is conceded to have been in part at least a triumph for the anti-militarists. "I see," a French paper makes an honest citizen say, "that Jaurès has rejected Hervé's views." "Yes," replied his neighbor, "with open arms."

Hervéism, at Stuttgart, was bitterly assailed by the German and English Socialists. To the latter it was, possibly, more or less an academic question, but to the Germans the matter was vital. If we should adopt the anti-militarist propaganda, Bebel declared in substance, our three million Socialist votes would disappear. In other words, close as the Socialist creed may be to the heart of the average German Social-Democrat, it cannot as yet venture to disregard such elementary sentiments as national and local patriotism. Hervé, with the terrible logic of the fanatic, demanded of Bebel what the German Social-Democrats would do if war was declared between Germany and France, and the French Socialists should rise in insurrection. Bebel did not reply. But when Hervé asked again, "For whom shall we, then, be fighting?" the Belgian leader, Vandervelde, responded, "For the King of Prussia!" The Congress thought so, too. It passed a resolution calling upon Socialists to exert their influence to prevent war, but—significantly—if war did exist, to labor for the re-establishment of peace; a declaration which any middle-class congress might have adopted.

The English Independent Labor party had submitted to the International Socialist Bureau an amendment abolishing the requirement that trade unions invited to participate in the international congresses must be "formally based on the principle of class struggle." The bureau recommended that the amendment be rejected. The Congress adopted a resolution declaring for the establishment of close relations between the various national Socialist parties and the labor unions. The latter, it went on to say, could not, unless imbued with the Socialist spirit, take effective part in the regeneration of the working class. This may be called a moderate declaration because it is capable of being variously interpreted. In Germany, where the Socialist party and the labor unions work hand in hand and are equally Marxian in their tendencies, it can work no particular change. In Great Britain, where the trade unions are "imbued with the Socialist spirit" without being quite prepared to base themselves "formally on the principle of class-struggle," the resolution does not compel them to a formal pronouncement, comprehensiveness, and not rigid orthodoxy, is the keynote of a policy that hopes, as M. Vandervelde declared, to conquer the world as primitive Christianity did.

In the matter of emigration and immigration, the Australian and American delegates argued for a policy of restriction. Socialists though they were, they could not escape the limitations of their environment, which in Australia calls aloud for an "all-white" Australia and in San Francisco professes fear of a yellow peril. The Congress declared against the importation of foreign laborers "as strike-breakers," a formula which the restrictionists could accept with perfect good grace on the principle that exclusion by any other name is just as sweet.

Only on the question of colonization did the radicals carry the Congress. Colonialism was condemned *in toto*, but only by a bare majority of nineteen, and after a commission had reported in favor of a moderate declaration on the subject. Both sides agreed that colonial expansion brought no direct benefit to the working class, which had to bear the cost of foreign adventure in money and lives. But whereas the minority maintained that external growth on the part of a nation was, after all, in line with the general course of history, their opponents successfully upheld the thesis that civilized society must first establish justice at home before it set out to teach justice to the heathen.

REAL UNIVERSITY EXTENSION.

A notable conference was held at Oxford last month, attended by delegates from two hundred working-men's organizations, to discuss means of bringing the university into closer relations with the laboring classes. These, as the Bishop of Birmingham pointed out, are now the governing classes in Great Britain—a truth strongly emphasized by the huge Liberal majority in Parliament, and by the radical measures, such as old-age pensions, urged by the present Government. Within two generations the extensions of the suffrage have slowly but surely transferred the power from the aristocracy and the upper middle class to the millions of wage-earners in the big manufacturing cities. In the meantime Oxford and Cambridge, true to their tradition as the home of lost causes and forsaken beliefs, have continued to educate the youth of the nobility and the well-to-do. This aloofness of the universities from the masses of the people has recalled Lord Sherbrooke's exhortation, "Educate your masters"; and the London *Spectator* anxiously asks:

> Now that the centre of power is moved, are Oxford and Cambridge prepared to meet the new state of things as they met the old? Are they prepared to render the same service to the governing class of the present that they so long rendered to the governing class of the past? Or, rather, since it would be idle to expect them to make bricks without straw, are they willing to make the changes in their machinery which are indispensable if workingmen are to become students and to take degrees?

To turn from England to America—the problem of our universities is obviously far different. In all our States the public schools, primary and secondary, furnish to all comers a free preparation for college. Throughout the West the State universities offer the higher instruction also free, or for a merely nominal fee. In the East the privately endowed colleges grant many scholarships to promising boys and girls; so that most of these institutions can boast, as Harvard does, that no youth of intelligence, ambition, and character need stay away because he lacks money. Thus it is that our colleges are remarkably democratic. Even the richest and most fashionable of them enroll many children of poor parents; and the son of an unskilled laborer may, if he have brains and pluck, rise without great difficulty to one of the learned professions. But the very fact that a college education is within such close reach, that there is no wide gap between gown and town, has perhaps made our college authorities too easily contented with existing conditions. In spite of all, then, we may well consider this English movement and seriously put the question whether we in America have really adapted the machinery of our univerisities to the needs of the community and are utilizing it to the full.

We would not for a moment suggest that a college education is the thing for everybody. On the contrary we are persuaded that our colleges, with misdirected kindness, sometimes make it too easy for stupid or lazy boys and girls, who are incapable of profiting by advanced study, to waste four years. We should like to see more rigid standards maintained, so that the energy of teachers and the income from endowments shall not be squandered on incapacity or idleness, whether among rich or poor. Indeed, we believe that in most high schools also, too much tenderness is shown to dullards who are unable to enjoy the advantages so generously held out to them. But granting all this, we urge that every possible opportunity be afforded the ambitious and the capable; for here, as in England, we must heed Lord Sherbrooke's warning to educate our masters.

To this end it is that we have so generally established night schools for the many boys and girls who are forced to become wage-earners and work by day before they have acquired the education they may reasonably desire. The night high school—comparatively speaking an innovation—is the logical sequel of the night grammar school. The utility of this night high school is already fully

demonstrated; no important city which has once established it would think of abandoning it. Thus far, however, our colleges and universities have not taken the next step beyond the high school, but have confined their evening instruction chiefly to the so-called extension lectures. These lectures are often excellent in their way; they may be both informing and stimulating. But, as Sir Robert Morant said at the Oxford conference, what is wanted "is not mere lectures, but real solid work in small adult classes with teachers who know how to teach." In this utterance he only echoed no less an authority than Cardinal Newman, who in his "Idea of a University" denounced the common delusion that "acquaintance with the learned names of things and persons, aud attendance on eloquent lectures, . . . and the sight of the experiments of a platform and the specimens of a museum"—that all this is intellectual discipline. In fine, extension lectures, however entertaining, are no substitute for the drill of hard study.

There is, we admit, ground for the objection that a college educatiou in the best sense of the term, can hardly be had without those years of residence, of contact with fellow-students aud teachers, of reading in the library, of play, of sauntering, and of reflection, of the almost indefinable influences which—as we grow older—seem to us so precious a part of our irrevocable youth. Yet because these pleasanter paths to the summits of learning are in the nature of the case barred to the man who toils in the shop by day and studies by night, that is no valid reason why the more laborious ways should also be shut. Hundreds of students—say at Harvard and Columbia—who are denied the joys of residence and sauntering, manage to secure an adequate education. It would therefore seem eminently fitting for universities in large cities to give well-organized night courses leading to a degree. Such courses would not fail to attract eager pupils. The experiment has, indeed, already been tried in several places; but most of the night instruction has thus far been tentative and rather unsystematic. The difficulties of the enterprise are obvious; though existing facilities in libraries, laboratories, and lecture-rooms might not require duplication, much money might be needed for a larger corps of teachers, for a night shift as well as a day shift. Here, then, is a practically untrodden field for philanthropist as well as educator. An endowment for the maintenance of a night college in New York, Boston, Philadelphia, or Chicago would not be thrown away, and it might achieve results of incalculable beneficence.

THE SECLUSION OF AUTHORS.

Between the traditional fate of the prophet and that of our average successful novelist there is one distinction to be drawn. The prophet carries on his work in his natal valley, and is refused honor there, while the author of a best seller enjoys honor and profit in the country of his birth, but writes most of his fiction abroad. The kinsmen of Virgil and Dante are growing accustomed to have their villas and palaces taken possession of, not only by iron, oil, and wheat kings from across the seas, but by the prosperous young story-tellers of *oltremare* who minister to the taste of the youngest of barbarian nations. The ordinary practising author or journalist of Italy, with his income approximating half the annual wages of his Calabrian compatriot digging ditches in the highways of New York, must rub his eyes and shake his head to see our Tarkingtons and our R. H. Davises flashing across their old Roman roads in expensive motor cars that Mæcenas, for all his good will, could scarcely have afforded to bestow on Q. H. Flaccus, his friend and client. John Smith, author of "Helen of Transcaspia," has a palace not so very far from where Soracte stands tall and white with snow; only Thaliarchus, instead of generously replenishing the wood fire, probably turns on the steam, when it grows too cold.

But in reality it is not osteutation that drives our writers abroad to dwell in marble halls, but quite the opposite desire for retirement. Marion Crawford, it would appear, escaping from crowds of American admirers who persist in invading his palace at Sorrento, has been compelled to flee for refuge into remote Calabria. There, in a deserted tower, in the very heart of the region made famous by the deeds of the dread bandit Musolino, he can find the seclusion so seemingly essential to his work. It is rather ominous, of course, that the reporter whom no one escapeth should have followed the novelist into his lonely tower, but that was possibly due to the relentless exigencies of the publishers' side of the business. In the same manner, Jack London, plunging independently into the mystery and charm of the South Seas, is compelled to get into touch now and theu with a cable station and to let an anxious world know about his latest fight with Chinese pirates and copra raiders. That in a way is the tragedy that ever besets the prominent writer in search of seclusion. Whether he crosses the ocean or endeavors to lose himself in the forests where rolls the Oregon, whether he avails himself of the railway or motor car or canoe, Horace's Black Care, in the form of the press agent, squats always behind him on the crupper.

The question arises, then, Why does the wielder of the pen go away at all? Why does he with blind faith strive, summer after summer, to disappear from the public eye, only to find himself dragged back within the range of that mighty organ by cable, telephone, or wireless? Here a distinction is in order. Marion Crawford and Jack London are really imperfect examples of the type, because their travels are largely undertaken in the legitimate pursuit of exotic copy. But why does Mr. Jones conceal himself in the Maine woods to write his novel, "The Earners," dealing with the life of employees in a New Jersey glass-factory? Why does Miss Robinson go to Alaska to complete the "Chronicles of Samantha," the scene of which is laid near Dedham, Mass.? Why does Henry Wadsworth Taylor leave Pittsburgh for the Adirondacks to work on his long-awaited story, "Thou Shalt Not," treating of the divorce problem? It cannot be just the desire to be alone with one's work that sends the literary craftsman into exile or back to Nature, since it is demonstrable that many an apartment in New York is more safe against unwelcome intrusion than a bungalow by the sea. Whoever invented the tradition that "Nature" is a friend to hard work, is responsible for much wasted effort. Nature is never so quiet as the four walls of a room are with the windows closed. Nature is always fidgeting, gossiping, chirping, buzzing, and moaning, chafing her leaves against each other, making her waves boom against the rocks. It is a question whether any really great books have been written close to her heart.

There is, besides, a respectable tradition in favor of pursuing one's literary labors in a crowd. The great Elizabethan drama was almost born and nurtured in the taverns where Marlowe and Greene and Nash caroused and fought and scaled the heights of poesy. And if the greatest of them all did not do his best work at the tavern, he probably did in the greeuroom of the theatre, with the actor folk crowding about him and the mob in the pit yelling for the show to begin. The age of Charles, of Anne and of the Georges did not differ in this respect from the age of Elizabeth, except that the coffee-house replaced the tavern. Villon did not write in cloistered chambers. Rabelais did not shrink from contact with the world; their descendants of the seventeenth and eighteenth centuries thought out their masterpieces amidst the rapid-fire conversation of the salon, and their descendants of the nineteenth century still show a remarkable fondness for the drawing-room, the foyer, the coulisses, and the cafés. So there is ample authority for maintaining that crowds and noise are not inimical to literature.

Not that there is lack of good testimony on the other side. To take two

of the very greatest contemporary figures, Ibsen lived away from Norway, his constant subject, during practically all of his productive life, and Turgenieff recreated Russia for its own people and for the outside world while a resident of Paris and the German watering-places. A strong case could be made out for the great advantage which a fair degree of remoteness from a subject may confer in the way of emphasizing outline and correcting perspective; and from that point of view our writers are quite justified in exiling themselves from the United States or from New York in order that they may understand and depict these States or New York the better. If only we could be sure that seeing a particular phase of life clearly and completely depended on distance away from it, it would be rather profitable than otherwise to have Mr. Davis write his books in the Congo, or Robert W. Chambers take his stand in Mars.

RICHARD MANSFIELD.

Richard Mansfield was unquestionably the most successful American actor-manager of his time. He had the good fortune to come to the front at a period when the old order of things theatrical was changing into the new and the production of first-class actors had been stopped by the gradual development of the star system. Mansfield started from small beginnings; but he was furnished by nature with artistic instincts and a resolute temper, and, moreover, had powerful financial influences back of him. His mother was Madame Rudersdorf, a great singer in her day, and it was to her that he owed the musical ability and the fine singing voice that led him naturally to seek first a career in the field of light opera.

His first great success in America was in "A Parisian Romance." The part of Baron Chevrial, which he played repeatedly for the rest of his life, he first essayed in the Union Square Theatre, under the management of A. M. Palmer, in January, 1883. Up to the evening of the first performance he was practically unknown; on the following morning he was on the road to fame and fortune. All the theatrical world was talking of the hit he had made. There can be no doubt that he turned a doubtful or very moderate success into a triumph. His make-up of the old Parisian profligate was a magnificent bit of artistry. It was difficult to credit that behind that wrinkled, pallid, leering, cynical, and hardened visage lay the rosy blooms and rounded contours of youth. Nor did the audience know that much of the Baron's manner was the manner of the actor. But the simulation of age was excellent, and the sudden death stroke interrupting the ghastly gayety of the ancient reprobate was given with a remorseless realism worthy of Novelli himself. The effect was electrical. The audience broke out into enthusiastic cheers, and Richard Mansfield's fortune was made.

We cannot trace here in detail the career which followed. Mr. Mansfield, although an intelligent, original, attractive, and popular performer, was not, except in a rather narrow range of eccentric parts, a great or even a remarkable actor. His intense egoism rendered him impatient of all reproof or instruction, and after his first triumph as Chevrial it seems never to have occurred to him that there could be anything further for him to learn in the way of acting. As a natural consequence, he soon became the victim of confirmed mannerisms and never, apparently, exerted himself in the least to veil his own individual personality beneath that of an assumed character. No matter what part he was playing, in voice, gesture, carriage, and progression, he was always Richard Mansfield, one and unmistakable. It is only fair to add that in the tricks of stage disguise he was an adept, and it was only when he spoke or moved that his identity was betrayed.

Magnificent as was his voice, his lack of elocutionary skill made him ineffective in the rendering of verse. In Shakespeare the faults of his delivery were peculiarly fatal. But he possessed in a remarkable degree that magnetic or sympathetic quality which holds an audience in thrall and renders it oblivious to technical defects or mere faultiness of impersonation. In his Richard, apart from its vigor and intensity, there was scarcely a redeeming point. T. P. Cooke himself could scarcely have expressed it in terms of lower melodrama, yet his performance of the part delighted the crowd and found favor even with more judicious observers. It is true that into characters with which he was temperamentally affiliated he occasionally threw striking and vital expression. But it was only in a limited range of eccentric character that he really excelled.

It was as an actor-manager rather than as an actor that he made himself famous. He did, indeed, make terms with the Theatrical Trust at a time when his opposition to it might have been of inestimable benefit to the American stage, and he adopted the star system in all its viciousness—except in its interminable runs—but he escaped from the hopeless groove in which most managers are caught, cut out a path for himself, and opened up to his patrons new and old fields of drama which otherwise they could never have entered. It cannot be asserted that his productions were all of equal interest or value, but most of them were distinguished by some solid qualification. A repertory that included works of Shakespeare, Molière, Hugo, Ibsen, Rostand, and Bernard Shaw was undeniably catholic. Mr. Mansfield offered much that was inspiring, little that was altogether trivial, nothing, so far as present memory serves, that was altogether base. Of few managers could so much be said. If he was not always a great artist, he sought at any rate the guidance of artistic instinct. That his death should seem to leave such a void is perhaps less a tribute to his greatness than a witness to the decline among us of the actor's art.

OUR CLASSICAL BELT.

When Secretary Wilson, the other day, ordered the Latin or quasi-Latin mottoes "Fructus," "Cereales," "Forestes," and "Flores" erased from the shields before the new Agricultural Department building, and their places filled by plain English, he probably did not realize how far he was failing in with a prevalent fashion. Doubtless, classical scholarship is achieving great results in this country; more of us than ever before are studying Greek and Latin. Yet at the same time the dead languages are losing even the last of their ceremonial uses. Banished from the college diploma and the legal document, they found, or at least Latin had found, a last refuge in the sculptured tablet, and now this is to be taken away.

The classical name in this country today is, in fact, very often a souvenir of one of the most curious periods in this country's history, the period when classicism of a sort pervaded the new country as French influence had still earlier, and was accepted with the same ingenuous enthusiasm. It is a period which has but small place in our literature. The late H. C. Bunner, however, was one who treated it with a light and sympathetic touch. An old white house, with tumble-down Greek portico, in one of his tales, "seemed to protest against modern contempt as though it said:

> I have had my day. I was built when people thought this sort of thing was the right sort of thing; when we had our own little pseudo-classic renaissance in America. I lie between the towns of Aristotle and Sabine Farms. I am a gentleman's residence, and my name is Montevista. I was built by a prominent citizen. You need not laugh through your lattices, you smug new Queen Anne cottage, down there in the valley! What will become of you when the falsehood is found out of your imitation bricks, and your tiled roof of shingles, and your stained glass that is only a sheet of transparent paper pasted on a pane? You are a young sham; I am an old sham. Have some respect for age.

That pseudo-classic renaissance in America which belonged to no particular locality nevertheless left its memorials distributed in a singular way. A population which is growing in a certain direction creates as it grows geographical zones which correspond like rock strata to the period of time within which they were developed. And so the classical obsession left behind it, like

fossils, the towns that it had named. They are not scattered at random through the country, but conform to a regular law. There are 27 cities and towns named Troy in the United States, 19 named Athens, 17 Uticas, 16 Alexandrias, 15 Romes, and 12 Carthages, not to speak of 7 Atticas and 7 Syracuses. The post-office, if nothing else, sees to it that there are no duplications within the same State. In fact, only two States, Indiana and our own New York, contain towns bearing all eight of the classical names just referred to. Ohio and Missouri contain seven each. These States are widely separated, yet if we mark off on the map all the States which have used more than half of the town names in question, they are no longer segregated, but form a compact belt or zone. A straight line drawn from Albany to Richfield, Kan., roughly measures its greatest length, and a similar line from Copper Harbor, Mich., to Memphis, Tenn., its greatest breadth. It includes Pennsylvania, Kentucky, Tennessee, Michigan, Illinois, Wisconsin, and Kansas.

Around this belt is a sort of fringe of States which have dabbled in the classical dictionary. Mississippi, Iowa, and Nebraska are almost entitled to inclusion. But the oldest States and the newest alike had no part or but small part in that enthusiasm. Six of the thirteen original States, Massachusetts, Connecticut, Rhode Island, New Jersey, Maryland, and Virginia, do not embrace a single Carthage or Rome or Athens or Attica or Troy or Utica or Syracuse or Alexandria. In the far West, likewise, there are eight States and Territories without so much as a freckle of the glory that was Greece and the grandeur that was Rome. The fashion ended as abruptly as it began.

The study of place and personal names has been rather on the increase. Clues to the deepest philological, archæological, and historical mysteries are found by learned men in the homeliest bits of nomenclature. In America we borrowed our names and borrowed them frankly. Never perhaps was there in the world a heavier draft on the visible supply of any commodity. But for the very reason that the choice of names by our pioneers was always a conscious process, it has a special interest of its own. There are many obscure factors. Why, for example, did the foreign immigrants in some sections name their towns after places in the old country, and in others take the most undistinguished titles in preference because of a supposedly superior local application? Does the distribution of Indian names on the map bear any relation to the friendly or hostile attitude between Indians and whites at the particular times when settlements were made? Did the Indian wars possibly make Indian names unpopular, as we know the revolution did such titles as King Street, which was here changed to Liberty Street? What of the habit of using the names of public men in their own lifetimes for towns and streets and squares? What is the connection of our Biblical designations with the "Great Awakening"? There is quite as much to be gleaned from this field as from some of the others over which candidates for the doctorate are toiling.

ROMAN ITALY IN THE NORTH.—VERONA.—III.

Passing eastward from Aosta and Ivrea across the base of the Italian lakes, around and above which were the nests of many unsubdued tribes in early Augustan times, we reach the opening of the next great Alpine pass at Verona.

The Verona of the Middle Ages strikes so dominant a note with its S. Zeno, S. Fermo and the Cathedral, with its S. Anastasia, its castle and tombs of the Scaligers, that it takes some time to realize not only how much of the Roman period still survives, but how vividly the ruins tell the story of a really great and rich city of the Augustan age such as Strabo and Tacitus lead us to infer. The immense amphitheatre—one of the half-dozen largest and best preserved—the recently excavated theatre, the two city gates called Porta dei Borsari and Arco dei Leoni, the piers of the *ponte di pietra*, the numerous sculptures and inscriptions in the two museums, form a rather imposing if somewhat disconnected total. If Roman Verona has hardly been taken at its real value, it is possibly because its purpose and history in the light of its monuments have been misinterpreted. Its amphitheatre is early, yet has been ascribed to Diocletian (about 290); and its two city gates are assigned to Gallienus on account of his restoration—inscription of 265 A. D. I propose a far earlier date for the gates, the first half of the reign of Augustus, and propose also to resuscitate a superb "triumphal," or colony, arch of the city, which, though torn down, still lies, *disjecta membra*, under the arcades of the amphitheatre. Were this the place, I could revive, from drawings of the sixteenth century, several other monumental arches and gateways which must have placed Verona almost immediately after Rome among Italian cities in the number of its monuments of this class.

Mommsen elects to follow Pliny, who calls Verona an *oppidum* or town, rather than the inscription of the Porta dei Borsari, accepted by Borghesi which proclaims Verona a colony as early as the time of Augustus. It seems to me that there are three reasons for believing Verona to have been made a colony by Augustus: (1) The inscription of Gallienus calls it so: "Colonia Augusta Verona"; (2) the gateway on which this inscription stands has all the characteristics in plan and style of the Augustan city gates, which are unknown after him; (3) the increased importance of Verona as part of Augustus's plan in northern Italy would necessarily make it a colony; and the intimate connection of the city at that time with Drusus confirms this view.

Travellers coming from the Tyrol through the Brenner Pass are always, as they emerge into the plain, impressed with the strength and picturesqueness of Verona's situation. For a low-lying city its impregnability is remarkable. It nestles where the river Adige, as it broadens out, takes a narrow double curve; the city is contained almost entirely in the lower arm of the S which surrounds it on three sides, while the fourth is protected by the canal of the "Adigetto," which cuts across the neck. What makes the arrangement more remarkable is that across the river, where the original settlement evidently stood, is quite a hill which served as acropolis for the Augustan colony and was connected with it by a heavy stone bridge.

At Verona the commercial east and west highway intersected the road up the Brenner Pass, the shortest and best means of communication between the valley of the Po and the region of the Danube and southern Germany. About sixty miles from Verona up the Brenner road lies Trent, the ancient Tridentum, which had been founded by the Rhaeti, occupied later by the Cenomanni, but being the first city site of importance on the Italian side of the pass, was seen by Augustus to be necessary to his plans. His troops occupied it in or before 24 B. C., and he proceeded to make it the advanced point for the concentration of troops and stores in preparation for the campaign of Drusus in 16 and 15 B. C., when the Alps were crossed and the provinces of Rhætia and Vindelicia added to the Empire. In this way the neighboring Alps received the name of Tridentine Alps. Here the Brenner road was joined by the Via Claudia Augusta, coming direct from Altinum in Venetia.

Trent, therefore, at the top, and Verona at the bottom of the military road, formed a third duet similar to Aosta-Ivrea and Susa-Turin. Does not this fact give some indication of the time when Verona became a colony? It is known that in late Republican and Augustan times the granting of colonial rights was coincident with the building of walls; and it is hardly conceivable that Verona should have been on a different footing from Turin. Her foundation undoubtedly came a few years later. The name, Colonia Augusta Verona, shows it was after 27 B. C. The date of the occupation of Tridentum, 24 B. C., may be approximately that of the colonization of Verona itself. The Rhæti and the Gauls seem to have occupied the Acropolis. The Romans first came here in 89 B. C., and either then or under Augustus established themselves on the level site across the river where the bulk of the Augustan city arose. It could not, on account of having its outlines determined by the curves of the river and the preëxisting acropolis, take on the exact rectilinear form of Turin and Aosta. Perhaps, as in a number of other cases, there existed here side by side a preexisting civil municipal town and a superadded military colony. This would explain the fact that Pliny calls Verona a *municipium*, and the Borsari inscription and Tacitus a colony.

Verona was far larger than Turin or Aosta. Its amphitheatre had 25,000 seats. It stood to reason, therefore, that its strip of clear sacred ground outside and encircling the walls, called the *pomerium*, would be wider than at Aosta, to make the defence the surer and the warning of an attack the quicker. When I was in Verona

this time I decided to put to tbe test here my theory in regard to colony arches: that they were built whenever an Augustan colony was founded; that they stood outside the walls; that they were placed on the outer *pomerium* line, across the main highway, outside the principal city gate. I placed myself, therefore, at the principal gate of Augustan Verona, the Porta dei Borsari, and paced off the distance beyond it on the line of the old Roman road toward Rome, until I should reach the outer *pomerium* line, wondering if at this hypothetical point I might not find some trace, past or present, of the existence of a colony arch. Bearing in mind the 366 metres of Aosta, and supposing that the greater size of Verona implied a correspondingly larger *pomerium* strip, I reckoned the distance here should be between 500 and 600 metres. My delight may be imagined when, at a distance of about 550 metres, I found a curious tbing. Stretched across the highway (Corso Cavour) was the outline of a Roman arch marked in tbe pavement by white cobble-stones edged with black. Here stood until 1805 what was called the Arch of the Gavii, an exquisite work of Augustan art. I had found that Verona had a colony arch, and I had found where the colony arch stood, on the outer *pomerium* line. But this was not all. Of course, in preparing for my book on Roman Triumphal and Memorial Arches I had listed this destroyed arch at Verona. I knew that it had been famous for its beauty, had been drawn and copied by Renaissance architects, and had been barbarously torn down by the French soldiery while they occupied Verona in 1805. I had supposed that, barring a few fragments, the arch was but a memory, to be reconstructed perhaps from these Renaissance drawings. But when I went to the amphitheatre to look up the supposed "few fragments," what was my surprise to find many of its dark vaulted passages filled with the materials of the arch. Slowly I pieced its Odyssey. Hardly had it been torn down in 1805 when the French left the city and an Austrian archduke offered to pay half the cost of rebuilding the arch; but the Veronese, impoverished by the terrible reprisals for their rising of 1798, were unable to furnish the rest and unable to agree as to the site, so all the *disjecta membra* were carted, none too gently, to the amphitheatre, and there they have remained, unknown to archæologists. The Veronese contented themselves by marking with those black and white cobbles the plan of the arch on the original site.

I know that the few specialists who have heard of this arch or read its inscriptions in the Latin Corpus will object that this is a private family arch because on it are the names of members of the Gavii family whose statues stood on the arch and in its niches. But this is an objection easily overcome. When Cæsar and Augustus founded military colonies of veterans, the new establishment was often put under the guidance of a military leader and his family, which was henceforth associated with the fortunes of the city. Thus the Julii and their colony arch at St. Remy, the Campani and theirs at Aix-les-Bains, the Sergii and theirs at Pola in Istria. Most convincing of all is the arch of the Sergli at Pola, where we find the names of the various members of the family of the man selected as leader of the colony by Augustus, Sergius, who had been tribune of the Twenty-ninth Legion, disbanded after the battle of Actium. This exact dating of the beautiful colony arch at Pola I am also giving to tbe *Nation* for the first time. Needless to say that, later in the reign of Augustus, when the legal ritual in connection with public monuments became carefully regulated and all arches were dedicated to the Emperor, it would have been impossible to give to local authorities and beroes such a prominent place on arches. I found some superb drawings of the Arch of the Gavii by the famous Renaissance arcbitect Palladio in the Public Library at Verona: with their help and the financial assistance of a lover of art like J. Pierpont Morgan it would be easy to rebuild and restore what is certainly the most beautiful of all the Augustan arches in Italy. I will even mention, as a possibility which I am investigating, that the arch may be a remnant of the pre-Augustan colony, and if so tbe earliest known arch in the Roman world.

Hardly second in interest is the principal gate of the Augustan city, the much-misunderstood Porta dei Borsari. What we now see is a gate with two wide twin openings framed by engaged columns supporting architraves and gables, and surmounted by two stories of arched galleries. It would seem to take but a very slight knowledge of art to see clearly that we have two very different periods and styles, and that the lower arcades are early and pure, while the galleries are late and debased; the former a work of Augustus, the latter of Gallienus. It is curious that this elementary fact has not been generally recognized. The surface of the Augustan frieze was cut down and a new surface irregularly and crudely made to receive the restoration inscription of Gallienus, stating that the walls of Verona were built between April 3 and December 4 of the year 265 by order of the Emperor Gallienus. This statement is guilty of evident exaggeration. It would have been quite impossible to surround tbe entire city with walls and gates in these few months. We know, besides, from Tacitus, that in the struggle before the advent of Vespasian, two centuries earlier in 69 A. D., the strongly fortified Verona was made the military centre of the German and Gallic army. What Gallienus did was merely a work of restoration of the neglected fortifications. At the Porta dei Borsari he substituted a two-storied gallery for the Augustan superstructure and, removing the inscription of Augustus, substituted his own, destroying even part of the mouldings of the early frieze.

If any further confirmation were required of the early date of the primitive gate, it has been supplied by some recent excavations, from which I am here drawing for the first time the evident conclusions. These excavations have shown that the present thin screen-like structure, usually thought to be merely a passageway, and to be the whole of the gate, was but the forefront of a massive gateway, with central court and rear façade, more artistic than but quite similar in scheme to the other early Augustan military gates at Turin, Aosta, Nimes, and Salona. Verona not being a purely military and utilitarian foundation, but a city of wealth and size, it was natural that the gates as well as the Colony Arch should be of greater artistic beauty. Comparing now, all these various Augustan gateways, we find a varied galaxy, differing not only in materials and architectural style, but in the number of arcades: here there are two, at Aosta and Salona there are three, at Nimes and Turin four.

Of another Augustan gate, the Arco dei Leoni, less remains, but it is less marred by later restoration, and it originally had tbe same plan, which has been traced and partly uncovered under the modern street. It may have been the Porta Principalis Sinistra. There were, as I have said, other early city arches and gates: across the river, the so-called Janus arch, which, perhaps, belonged to the pre-Augustan city; tbe so-called Arch of Jupiter Ammon, that stood across the intersection of the two thoroughfares in the centre of the city; the early gate called the Arch of Valerius; and that near the Church of S. Tommaso. From a study of these monuments it is possible to reconstruct in part the plan of Roman Verona, and to see how, even at present, the city continues to follow the lines of the Roman streets, and that it contains unsuspected treasures of early Roman art.

At some time between c. 25 and 20 B. C. Verona was therefore recolonized and rebuilt by Augustus and served as base of supplies for Drusus in his great campaigns in the north, beyond the Alps, in connection with Tridentum. Still further east we reach the ultimate military route in Italy, that starting from Aquileia at the head of the Adriatic, and leading northward past the second member of this fourth Augustan duet, Emona on the upper Save, across the Julian Alps to Pannonia: this was the great military artery of communication with the Danube, and so an integral unit in the scheme of Augustan conquest. But thus far no architectural remains of his time have come to light in either, and I shall turn to other cities still further eastward in Istria and Dalmatia for the abundant traces of the great work which Augustus planned and carried out in tbis region as a sacred inheritance from Julius Cæsar even before he had worked out the complicated scheme in northern Italy which we have been studying.

A. L. FROTHINGHAM.

Princeton, N. J.

A NEW MANUSCRIPT OF POE'S.

A recent writer on Poe, after quoting a statement from the late R. H. Stoddard to the effect that "a new and well authenticated poem" by him, it "will never be possible at this date to find," says:

> Tbe discovery of a new Shakespeariau play might be more interesting to more people, but in America, and in France, where Poe's influence has distinctly touched two groups of authors belonging to two generations, a genuine Poe discovery would, with large numbers, take precedence.

Sucb a "genuine Poe discovery" has been made. One of his manuscripts, not used, apparently, by any American editor, and in large part unpublished, has come to light, and has been acquired by S. H. Wakeman.

In the *Southern Literary Messenger*, December, 1835, Poe, who was then the editor, printed some extracts from a play un-

der the title "Scenes from an Unpublished Drama"; and further extracts, under the same title, appeared in January, 1836. In 1845, when he collected his verse in the volume, "The Raven and Other Poems," these extracts, rearranged and slightly altered, were reprinted as "Scenes from Politian: an Unpublished Drama." The manuscript of this drama (Poe's only play) has recently come to light. It once belonged to John H. Ingram, the English editor of Poe's works, though it passed from his hands many years ago. It is not complete, but the twenty folio pages contain nearly six hundred and fifty lines which, so far as we know, have never been printed. At the top of the first page is the heading:

Politian—a Tragedy
Scene—Rome in the Century.

The manuscript ends in the third scene of Act IV, with Politian alone in the Coliseum at night. One leaf, at least, perhaps the whole Fifth Act, is lacking. The manuscript, in Poe's autograph, is generally clean, with few alterations. There are however, occasional interlineations, and some lines have been marked out. In one place a piece of paper, about one-third of a page, has been pasted down. By separating these two sheets, the earlier draft underneath would become legible. At the head of the first extract printed in the *Southern Literary Messenger*, Poe has written, in pencil: "Scenes from Politian. An Unpublished Tragedy by Edgar A. Poe. Act 2—Scene 3." showing apparently that this was the manuscript used by printer for the selections. A comparison of the published portion of the manuscript with the printed text shows, however, some variations.

Additional interest is lent to the manuscript by the fact that Poe accused Longfellow of imitating this play. In the *Broadway Journal*, March 29, 1845, Poe pointed out similarities between Longfellow's "The Spanish Student" and his own "Scene from Politian, an Unpublished Tragedy," found in the *Southern Literary Messenger*. After printing extracts from the two plays, he concludes:

> The coincidences here are too markedly peculiar to be gainsaid. The sitting at the table with books, etc., the flowers on the one hand, and the garden on the other, the presence of the pert maid, the reading aloud from the book, the pausing and commenting, the plaintiveness of what is read, in accordance with the sorrow of the reader, the abstraction, the frequent calling of the maid by name, the refusal of the maid to answer, the jewels, the "begone," the unseen entrance of a third person from behind, and the drawing of the dagger, are points sufficiently noticeable to establish at least the imitation beyond all doubt.

Several important Poe manuscripts have been sold at auction in recent years. The original manuscript of "The Bells," which formerly belonged to William Nelson of Paterson, and was included with other material in the Harold Pierce sale in 1903, brought $2,100. It was written on sheets of blue paper, pasted end to end. Spread out it formed a continuous sheet 37½ inches long. Hardly less interesting is the manuscript of "Ulalume," five sheets of quarto paper pasted end to end, which brought $1,000 in the McKee sale, February, 1905. In March, 1905, a considerable portion of an early draft of "Tamerlane" was sold with Bishop Hurst's library, bringing $801. This was written on both sides of five quarto leaves, the first page numbered 9, and the last 20. This manuscript, which differs from the printed text, is certainly an earlier version than the one printed in that excessively rare little book published by Calvin F. S. Thomas, Boston, 1827. In the Hurst manuscript there are 157 lines, while the corresponding portion of the book contains some 75 additional lines, added during revision. There are also many variations between the manuscript and the printed text. The manuscript of the prose tale, "The System of Dr. Tarr and Professor Fether," at Anderson's in March, 1904, brought $505. This was written on small 12mo sheets pasted together; when unrolled it formed a strip about twenty feet long. Another manuscript of similar character, "A Tale of the Ragged Mountain," forming a strip about fifteen feet long, brought $230 in the George T. Maxwell sale, 1895. These two are perhaps the best specimens extant of Poe's curious rolled manuscripts.

Correspondence.

VIRGIL OR VERGIL?

To the Editor of The Nation:

Sir: I was recently looking through the Miscellanea of Angelo Poliziano (sometimes called Politian) in an attractive edition of his works published in 1498, four years after his death, by Aldus Manutius. Of the hundred chapters, the majority deal with points of literary or historical criticism and interpretation, which long ago ceased to be discussed; one, however, contains an argument more akin to the philological controversies of later times. This chapter, which Virgilian scholars even now sometimes refer to, is entitled "Quo argumento dicendum Vergilius, non Virgilius," and presents the reasons why Poliziano preferred the former spelling of the name.

He remarks that while the current spelling was *Virgilius*, the learned were disposed to favor *Vergilius*. He then offers two kinds of evidence to support the spelling *Vergilius*, that of inscriptions and that of the manuscripts. Under the latter head he cites not merely the well-known Vatican manuscript of Virgil written in capitals (R), but also codices of the Pandects, of Donatus, of Augustine's "De Civitate Dei," of Columella, and of Seneca.

The contention of the Italian humanist in favor of *Vergilius* as the classical Latin form has been abundantly sustained by the extensive and painstaking study of the manuscripts and inscriptions since his time. Ritschl (Opusc. philol., vol. ii., p. 779), summed up the case by saying that this spelling is attested both by the concurrent testimony of the older manuscripts of the poet and by the consistent use of the name in inscriptions as *Vergilius* from the second century before Christ until the fourth century of our era. By the sixth century *Virgilius* had come into vogue, for reasons which it would not be pertinent to our present inquiry to analyze; and when the vernacular languages of modern Europe began to be reduced to writing the late Latin form *Virgilius* was commonly used; hence, forms of the name in Italian, Spanish, French, German, and English came to have *i* as the vowel of the first syllable.

From other sources we know that Poliziano was by no means the only scholar of his age who broke with tradition, and, returning to the classical form *Vergilius*, used this in his writings. The author of "De Inventoribus Rerum" and the "Anglica Historia," Polydorus Vergilius (Englished as Polydore Vergil in the title of the translation of the latter work published by the Camden Society) spells his own name with an *e* in the first syllable and cites that of his great-grandfather, a teacher of philosophy at Paris, as Antonius Vergilius. Of the ninety-two editions of the complete works of the poet published in the fifteenth century and described by Copinger (Trans. Bibl. Soc., vol. ii) at least ten have *Vergilius* in the general title or in the title of Cristoforo Landino's commentary, though elsewhere they recognize also the spelling *Virgilius;* nine of these editions were published in Venice.

In the following century the two spellings of the Latin name appear side by side; there was a rivalry between *Virgilius* transmitted from the Middle Ages and *Vergilius* restored by scholars. Not far from one-third of the sixteenth century editions of Virgil in the collection of the British Museum have the latter spelling in their titles; and in the same period *Vergilio* was used in several Italian translations. After the sixteenth century the restored spelling lost ground rapidly, no doubt on account of the influence of the vernacular forms; it became increasingly rare until by the end of the eighteenth century it had almost entirely disappeared both in editions of the poet and in the writings of scholars.

Toward the middle of the last century in Germany remarkable progress was manifested in restoring the texts of several Latin authors. Jahn's Persius, for example, appeared in 1843, his Juvenal in 1851; Nipperdey's Cæsar was published in 1847, and Lachmann's Lucretius in 1850. In this period names and titles were more carefully scrutinized than in any former age since the time of the Latin grammarians, and the name of our poet received its share of attention. Already before 1850 the spelling *Vergilius* had begun to appear in the writings of scholars; and in the decade from 1850 to 1860 both the Latin form and, in Germany, the vernacular form *Vergil* became common. Nevertheless, as late as 1861 a meeting of philologians in Frankfort debated at length the question which spelling of the Latin name should be used; the form *Vergilius* was not generally adopted until after the appearance of Ribbeck's large edition, of which the first volume left the press in 1859, and the discussion by Ritschl, which was published in 1868. The corrected spelling of the Latin name has now become so fixed in philological literature that we can hardly doubt that it will remain permanently.

Altogether different is the question of the spelling of the name in English. It would be a waste of time to bring forward proof to show that from the beginnings of the English literature until now *Virgil* has been the accepted literary form. Under the impulse of the restoration of the classical spelling a number of German and American scholars and teachers, a few English and

still fewer French and Italian scholars introduced an *e* into the first syllable of the vernacular forms of the name. The experiment of changing the spelling in these languages has now had about forty years of trial, and we may properly make inquiry in regard to the results.

The convenience of classical students would, of course, be subserved by the general adoption of the spelling *Vergil;* how awkward it is to be obliged to write the Latin form with one spelling and the English with another! Many of us hoped that the revised spelling would be acceptable and would generally prevail. After four decades, however, we must, I think, frankly admit that the effort to make current in English the corrected spelling *Vergil* is a failure; the tendencies of our vernacular are too strong to be shaped by the protests and example of a group of specialists. But of classical scholars by no means all adopted the reformed spelling of the name; and it would not be fair to attribute wholly to conservatism their disinclination to recognize the innovation. In England Professor Nettleship, to be sure, adopted the new spelling, as did Robinson Ellis and a few others; yet are we to suppose that H. A. J. Munro or the late Richard Jebb were less sensitive to considerations of scholarship than they? These scholars continued to write *Virgil,* as did Sellar; and this is the spelling adopted by the Mayors, by J. S. Reid, Lewis Campbell, Haigh, and a host of other British scholars of standing. According to present indications, the use of *Vergil* is declining, that of *Virgil* is gaining ground. Leaving out of account the spelling adopted by writers outside the classical field, we may perhaps measure this tendency with the help of statistics. A rough count designed to indicate the usage among English-speaking scholars who contributed to the literature of our poet in the decade from 1887 to 1896 showed that approximately one-half spelled *Vergil;* in the decade just closed, 1897 to 1906, only about one-third used this spelling. We are able, I believe, to discern in these facts the manifestation of a tendency which is stronger than the influence of any group of specialists. One or two aspects of it seem capable of analysis.

In the first place, the change of spelling in English from *Virgil,* the historical English form, to *Vergil* is not accompanied by any change in the pronunciation. The "Century Dictionary," for instance, marks as identical the pronunciation of the first syllable of *verger* and *virgin;* even if we should try to make a distinction in pronunciation between *Virgil* and *Vergil,* the tendencies of our speech toward the obscuring of the vowel sounds would soon nullify our efforts. The distinction is therefore wholly addressed to the eye, and is not in the direction either of greater accuracy of phonetic discrimination or of simplified spelling, of which we hear so much at the present time. The use of the spelling *Vergil* has then no other motive than to teach etymology, to suggest to the reader (for the hearer cannot tell which spelling is used) that the Latin proper name has an *e* and not an *i* in the first syllable.

Again and again has experience shown how difficult it is to exempt a single word from the class or category to which it belongs and by purposeful effort to give to it, so to speak, an individual form and career. If we are to teach etymology through the spelling of English words, could we not as properly insist upon *cælestial* for *celestial* as upon *Vergil* for *Virgil*? If proper names are to be singled out for restoration to etymological forms, should we not write *Horate* instead of *Horace*, *Juppiter* instead of *Jupiter*, and *Neapolis* instead of *Naples*? The truth is that mankind has no reverence for a derivation. If our case could be left to a tribunal of scholars, there can be no doubt about the final issue. But the court of last resort in matters such as that under consideration is not the consensus of expert opinion; it is usage. Recently Dr. Henry Bradley, who is associated with Professor Murray in the editorship of the new "Oxford Dictionary," was asked whether any changes in spelling were to be introduced into the work. He is quoted as replying: "No. We take words as they stand in current literature. That is the form of spelling accepted by the people, although it may not be as it ought to be."

All will agree that the confusion in the spelling of the poet's name in editions and in the periodicals is unfortunate. In no previous period was it more important for students of the classics to present an unbroken front to the forces of philistinism. In order to compass the largest measure of good for society which we serve, our work and interest should be brought into the closest possible relation and sympathy with the life about us. On this point of classical scholarship we have appealed to Cæsar. We have offered the spelling *Vergil* because it is etymologically correct, and it has been rejected. Shall we classical teachers and students then persist in using it as a mark of erudition, as a special badge of distinction for our class? Such use would surely lay us open to the charge of pedantry; and we may perhaps not inappropriately apply to our own conditions the words penned by Ritschl forty years ago, at the close of the discussion already quoted: "May pedantry not cast over learning a shadow to bring down upon it the ridicule of the wider circle of cultivated people!" The fellow countrymen of Ritschl have not heeded his warning in respect to the spelling of the name of the Roman poet; but in matters such as this we may well believe that the literary traditions of the English are in some respects more sharply defined and persistent than are those of the German stock.

FRANCIS W. KELSEY.

Ann Arbor, Mich., August 24.

JOHN EVELYN ON SPELLING REFORM.

TO THE EDITOR OF THE NATION:

SIR: I ventured some months ago to send you an extract from Howell's Letters, expressing his desire for changes in the spell- of English, similar to those that are under consideration to-day. In reading Evelyn's Letters, I find the following passage, of like tenor. It is of the date 1665, and is addressed to Sir Peter Wyche, who was the chairman of a committee appointed by the Royal Society "to consider of the improvement of the English tongue."

> I would humbly propose . . . that a more certain orthography were introduced by leaving out superfluous letters, etc., such as *o* in Woomen, People; *u* in Honour, *a* in Reproach, *ugh* in Though, etc.

The chief interest, I think, in these suggestions, as in those of Howell, lies in the fact that we have already adopted some of them, an argument for our adopting all. We no longer write Woomen, why should we write People? GRACE NORTON.

Cambridge, Mass., August 24.

Notes.

Among the books which Houghton, Mifflin & Co. announce for publication this autumn are "Greece and the Ægean Islands," by Philip S. Marden; "The Pulse of Asia," a book of travel and exploration in Central Asia, by Ellsworth Huntington; "Human Bullets," a soldier's story of Port Arthur, by Tadayoshi Sakmai, with an introduction by Count Okuma, translated by Masujiro Honda and Alice M. Bacon; "Memoirs of Monsieur Claude," chief of the police under the Second Empire, translated by Katherine Prescott Wormeley; volumes III and IV of Col. Theodore A. Dodge's "Napoleon"; "Life of William Pitt Fessenden," by Gen. Francis Fessenden; "Life and Times of Stephen Higginson," by Col. Thomas Wentworth Higginson; "Elizabethan Drama, 1558-1642," by Prof. Felix E. Schelling; "The Literature of Roguery," by Frank W. Chandler; "Personalism," by Prof. Borden Parker Bowne; "The Stannaries," a study of the English tin-miner, vol. iii. in the Harvard Economic Studies, by George Randall Lewis; the Cambridge Edition of Spencer's Complete Poetical Works, edited by Prof. R. E. Neil Dodge; "Longfellow's Sonnets," edited by Ferris Greenslet: "The Temple of Virtue," six sermons by the Rev. Paul Revere Frothingham; "Mornings in the College Chapel," Second Series, short addresses by Prof. Francis G. Peabody; "Bibliography of Ralph Waldo Emerson," by George Willis Cooke; "A Theory of Motives, Ideals, and Values in Education," by William E. Chancellor; and "Smokeless Sin," by Prof. Edward Alsworth Ross.

The Macmillan Co. announces as forthcoming "The United States as a World Power," a critical study of the international position of the United States to-day, by Prof. Archibald Cary Coolidge of Harvard. The author discusses the formation and growth of the United States, the composition of its white population, the colored elements; the Monroe Doctrine, the Spanish War, and the Acquisition of Colonies; the Economic Status of the Country; the relations of the United States with continental Europe, England, Canada, and the countries of Latin-America; the presence of the United States in the Pacific and its relations with China and Japan. The same firm will soon issue a revised and enlarged edition of Henry Charles Lea's "History of Sacerdotal Celebacy in the Christian Church"; the second volume of the new edition of William B. Yeats's Poems, containing dramas in verse; Lieut.-Col. J. H. Patterson's "The Man-Eaters of Tsavo and other Adventures in British East Africa."

Doubleday, Page & Co. will issue this month "Memoirs of an Arabian Princess," translated by Lionel Strachey; "The Uprising of the Many," by Charles E. Russell; and "Famous Stories Every Child Should Know," edited by Hamilton Wright Mabie.

A great number of curious details of mediæval and modern criminal procedures are given by E. P. Evans in "The Criminal Prosecution and Capital Punishment of Animals" (New York: E. P. Dutton & Co.). Noxious beasts, such as weevils, rats, and larger animals, were summoned to appear before the civil court, where, being unable to attend in person, they were represented by a procurator appointed by the judge. Their devastations being proved by witnesses, it was urged by their counsel that they were God's creatures and therefore entitled to food, or that they were God's instruments for the punishment of the sins of the people; these pleas often prevailed, and a place was assigned the beasties, to which they were commanded to betake themselves. If they continued their depredations they were cited to appear before the ecclesiastical court, which ordered them to depart under pain of anathema. They could not, however, be excommunicated, since they were not members of the church. Pigs, bulls, and other animals were regularly tried for manslaughter, and if found guilty, were publicly executed. Punishment was regarded sometimes as retaliatory, sometimes as preventive. Distinguished jurisconsults pronounced elaborate arguments and wrote learned books on the methods and principles of the trial of animals. The questions whether they were morally responsible and whether they were lay or cleric were discussed. Injurious beasts were often regarded as instruments of Satan, possessed by demons, which might enter into human beings and must then be exorcised. This view is the attenuated form of the early belief in the divine character of animals. The worship of animals originates not as our author holds (p. 85), "in the belief that they are embodiments of devils," but in the conviction that they are gods. An additional chapter deals with mediæval and modern penological theories, and many old legal documents are given in an Appendix. The bibliographical material is valuable. The volume is the result of the revision and expansion of two essays by the author printed in the *Atlantic Monthly* in 1884.

A few readers who have an eye for religious literature of the finer qualities may remember a slight volume of sermons of some seven years ago entitled "Dwellers in Tents," by Frederic E. Dewhurst, then a Congregational clergyman of Indianapolis. The discourses indicated a preacher of quiet manner, but of exceptional insight in religious matters, and the same qualities are evident in "The Investment of Truth and Other Sermons" (Chicago: The University of Chicago Press), a posthumous volume, with an Introduction by Prof. Albion W. Small. The sermons are of the essay type, with no attempt at oratory or immediate impression, but forceful by reason of firm grasp of essential spiritual truth, clear diction, orderly arrangement of thought, and abundant sympathy with present problems and doubts. Mr. Dewhurst's appeal is to the few, but to these he appeals strongly.

The Rev. Wilbur F. Crafts, the moral reform agitator, has revised his Princeton lectures on "Practical Christian Sociology," and brought to date the large mass of statistics contained in the volume (Funk & Wagnalls Co.). The theme of the lectures is "the study of society from a Christian standpoint, with a view to its Christianization." The very full notes on the text include a large number of bibliographical references, which complete indices render easily available. Some seventy-five pages are devoted to "chronological data of humane progress." The book is a repository of sociological facts, chiefly arranged with a view to agitation against intemperance, impurity, and gambling, and in favor of the observance of Sunday.

The interest now being evinced in a modern conception and interpretation of the Scriptures can be seen from the fact that the new condensed commentary on the New Testament, strictly along critical lines, edited, with the coöperation of other experts, by Prof. Johann Weiss of the University of Marburg, the first edition of which appeared not many months ago under the title "Die Schriften des Neuen Testaments neu übersetzt und für die Gegenwart erklärt" (Goettingen: Vandenhoeck und Ruprecht), is already appearing in twelve sections, at one mark a piece, in a second edition. About one-half of the second edition has come out, covering Mark, Matthew, and Luke, together with the Acts. It is significant that the Gospel of John is not yet included, but will be found later among the Apostolic Epistles as a *Lehrschrift*, and not as an historical account of the life of Christ. The whole is preceded by an introduction, "Geschichte des Neuen Testaments," by Professor Jülicher, the contents of which are largely a condensation of the author's views found in his "Einleitung in das Neue Testament," one of the best in the set that makes up the Grundriss der theologischen Wissenschaften, published by Mohr, of Tübingen. The fundamental conception of the gospels here elaborated is that the Scriptures contain reliable, historical data concerning both the sayings and doings of Jesus, but in addition also not a little unhistorical accumulation of fable, fiction, and the like. To separate these two elements is the critic's chief business. Works like this new commentary, the Grundriss series, Marti's Old Testament commentary, and others show to what a remarkable degree the Germans have learned to condense and to popularize for the general reader the results of their vast critical researches. It is scarcely a dozen years ago since such scholars as the late Professor Stade of Giessen lamented that England and America understood the secret of the condensation of learned theology and Germany did not.

Prof. E. Sellin of the University of Vienna, who has had charge of the archæological researches made by the Germans in Palestine in recent years, and under whose direction the German Archæological School at Jerusalem began its work on the site of the Biblical Jericho, has just sent his preliminary report to the Vienna Academy of Sciences. The excavations are being made by about one hundred natives at five different places near the Elisha fountain. In the northern section were discovered the ruins of an old castle, which consisted of a tower twenty feet high, and a structure of four stories, connected with stone steps. In three of the rooms were bake-ovens. Utensils of various kinds were discovered, as also reliefs, with a picture of fleeing gazelles pursued by a lion. Another structure, with utensils of various kinds, was laid bare in another portion of the grounds. In still another some remnants of the old city wall of Jericho were unearthed, at one place a section of a brick wall as much as forty feet thick, built on a foundation of hewn stone two feet high. At another place, the searcher found private houses in different strata, built one upon the other, and evidently representing different stages in the history of this famous city. Most of the houses belonged to the old Canaanitish and prehistoric age. Among the finds are lamps, plates, weights, needles, handmills, and the like, some of clay, others of bronze. Professor Sellin will continue his researches next season.

"Systematische Philosophie," constituting Teil I., Abteilung VI., of the excellent series, Die Kultur der Gegenwart, ihre Entwicklung und ihre Ziele, edited by Prof. Paul Hinneberg (Leipzig: B. G. Teubner), is the seventh volume of this set. The purpose of the series is to present from the pens of leading authorities in every department of scientific research a brief, yet complete, account of the results, present status, and problems, the whole to constitute a collection, a *multum in parvo*, from which the thoughtful reader can get a clear conception of the factors and forces that enter into the composite of modern intellectual and spiritual life. This latest volume is the combined work of nine recognized specialists, chiefly from the university circles of Germany. Wilhelm Dilthey writes the Introduction, "Das Wesen der Philosophie" (1-72); Alois Riehl, "Logik und Erkennsnistheorie" (73-102); Wilhelm Wundt, "Metaphysik" (103-137); Wilhelm Ostwald, "Naturphilosophie" (138-172); Hermann Ebbinghaus, "Psychologie" (173-246); Rudolf Eucken, "Philosophie der Geschichte" (247-281); Friedrich Paulsen, "Ethik" (282-348); Wilhelm Münch, "Paedagogik (313-348); Theodor Lipps, "Æsthetik" (349-388). The concluding discussion, "Die Zukunftsaufgaben der Philosophie," is by Friedrich Paulsen (309-422). Each of these surveys is opened with an Introduction, containing generally an historical account of a discussion of principles and problems, and a helpful selection of the best literature on the subject. Of the six volumes which have preceded this on Systematic Philosophy, five belong to Teil I., and are entitled "Die Allgemeinen Grundlagen der Kultur der Gegenwart," from seventeen authors, Paulsen, however, appearing twice: "Die Orientalischen Religionen," from nine authors; "Die Christliche Religion mit Einschluss der Israelitisch-Jüdischen Religion," from fourteen authors, including not only such advanced leaders as Wellhausen, Jülicher, Harnack, Troeltsch, but also conservatives like R. Seeberg and Bonwetzsch, and even the lately deceased brilliant Catholic historian of Tübingen, F. X. von Funk; Die Orientalischen Literaturen," from twelve authors, among them Erich Schmidt, Erman, Bezold, Gunkel, and the prince of German Orientalists, Nöldeke; "Die Griechische und Lateinische Literatur und Sprache," by six authors, among them Wilamowitz-Moellendorff and K. Krumbacher. Teil II. is so far represented only by a single volume, namely "Systematische

Rechtswissenschoft," from twelve authors. The cost of these volumes is from nine to eighteen marks, according to size. In many respects these discussions remind the reader of similar articles in the "Encyclopædia Britannica," but in this case they are the work of German scholarship alone, and not the outcome of an international co-operation of savants. So far, the undertaking has received the warmest welcome at the hands of critical journals in Germany.

Louis Franklin Snow has published his thesis for the degree of Ph.D. at Columbia, "The College Curriculum in the United States." This volume, containing 186 pages, is an elaborate study of the development of the curriculum from the founding of Harvard to the present day. Dr. Snow has laid under contribution a large mass of books and documents, many of them not easily accessible; he has consulted not merely printed catalogues, rules of government, and committee reports, but also the private records of various boards of trustees and faculties, as well as diaries and memoirs of students and professors, some of them still unprinted. To this material he has given clear and orderly arrangement in six chapters, supplemented by a bibliography. "The history of the college curriculum in the United States," says Dr. Snow, "might well be written from five formal documents." These are: The Laws of President Dunster of Harvard, 1642; the Programme of the First Provost of Pennsylvania, 1756; the Report of the Yale Faculty, 1828; the Report of the Committee of Ten, 1892; and the Incorporation Papers of the Carnegie Institution of Washington, 1902. To the analysis of these documents and of their effect both on the colleges for which they were specially prepared and on other institutions. Dr. Snow very properly devotes much of his space. Subordinate matters, however, receive suitable attention. The thesis is fully annotated; and both text and notes contain many curious and interesting facts gleaned from the history of higher education in this country.

Those familiar with Prof. Friedrich Paulsen's life-long activity in the educational world centring at Berlin, and his masterly handling of the history of the German universities, will feel that no one could discuss "Das deutsche Bildungswesen in seiner geschichtlichen Entwickelung" (just published by Teubner in Leipzig) so well as he. He is not dismayed by the limitations of space imposed by the plan of the series Aus Natur und Geisteswelt, for if he must pass numerous details unnoted, he is able to sketch with firmer hand and in nobler outline the main figures in the development of a system that, long before the world paid homage to German arms, excited the admiration of mankind. Professor Paulsen takes large views of human society and the part played by his countrymen in it; he sees that the forces at work in the German school system do not act independently, but that the German world of culture is controlled by the ebb and flow of forces in the wider circle of *Kultur* in various lands. The work is divided into four books: the first dealing with the first half of the Middle Ages, A. D., 600—1200, when cloister and cathedral schools predominated, and the second half, A. D., 1200—1500, when universities and city schools were established; the second book carries the reader on through the Renaissance and the Reformation; the third outlines the ruling tendencies of the times following 1650 and the new *Bildungsideal*, showing the penetration of modern forces in the educational systems, and the status of affairs at the end of the eighteenth century; the fourth is devoted to the development of education in the nineteenth century, with a modest but satisfied retrospect of the whole, and a glance far out, and beyond the seas even, into the future. There is no index, but there is a bibliography of nearly forty titles, none of which shows that any American scholar has yet commanded attention abroad for a consummate study of the educational methods of the Germans. With this little volume, Professor Paulsen rounds out an exhaustive study of German educational conditions, begun long before his "Geschichte des gelehrten Unterrichts" which, in its second, enlarged edition of 1896, attracted such wide attention.

The centenary of the independence of Mexico will be celebrated in 1910 by the opening of the new University of Mexico. A large amount is to be spent on the building and equipmeut, and this is only one symptom of a general demand expressed by all classes for educational advance. A federal educational department has been created, and the authorities of the various States are also taking a warm interest in the question.

Perhaps the most important contribution of the year to Scandinavian philology is Prof. A. Kock's "Svensk Ljudhistoria"—History of Swedish Sounds—of which the second part has just been issued from the press of C. W. K. Glurup, Lund, Sweden. The first volume, which covers only the vowels, contains 504 pages; vol. ii., which is to deal in a similar way with the consonants, is to be issued in the near future. Professor Kock traces historically Swedish sounds from the Primitive Germanic period through Old Scandinavian and the Middle Swedish period down to the present time. While this work is intended primarily, of course, for Scandinavianists, it forms also a distinct contribution to general Germanic philology, and even contains many hiuts on Indo-European conditions.

G. Steichert & Co. of this city import a "Geschichte der Vereinigten Staaten," by Dr. E. Daenell, professor at the University at Kiel. Professor Daenell is usually well informed, and as kindly disposed toward us as any German could be who perceives that in 1898 we threw to the wiuds Washington's good advice about mixing up in other people's affairs, and that, as a consequence, we are now scrambling for our share of the world power. Like many Germans who handle our statistics at more than arm's length, he has a touch of sad humor. For example, he gives a list of the Presidents of the United States, and finds among them Jefferson Davis! There is a bibliography of seventy-five books bearing on America, of which thirty-four are in German; but one fails to see how such a work can be practical without an index.

Recent movements in Germany for the training of women in library work, and the increasing proportion of women employed in both the scientific and popular libraries of that country, are made the subject of a special investigation and report by the *Zentralblatt für Bibliothekwesen*. From this report are summarized the following facts: Two schools for the special training of women in library economy are now in operation in Berlin. One, founded in 1900, by Hottinger, has a course covering three years of study, including four foreign languages, science, history, literature, as well as the practical technique of library work. For admission it requires a high school certificate or its equivalent. The other school, planned along somewhat different lines, was founded in 1902 by Professor Wolfsteig. It admits no one under nineteen years of age, and requires for its final certificate of graduation, not only a theoretical knowledge of library science, but satisfactory service for at least six months in a library or publisher's office. From this school, seventy-five women have already received certificates, of whom twenty-six have found places in scientific libraries, and eighteen iu public libraries. On the general question of the suitability of women for library work, the report is conservative, particularly in regard to positions in the more scholarly libraries, pointing out, however, that even in these there are occupations for which women may be well qualified, such as the arrangement of cards and the copying of titles for the catalogue. For work in popular libraries, a much wider sphere for women is recognized. The report, while not assuming that they are fitted to be heads of large city libraries, yet admits that in these libraries there are many important positions to which women may legitimately aspire; and that in many smaller cities the libraries, if properly grouped under the supervision of a man, might be treated as coöperating branches of one system with a woman at the head of each branch. The hope is expressed that with the increase of the number of women in the profession much may be doue for the extension and improvement of the people's libraries.

In Portsmouth, N. H., the early home of the late T. B. Aldrich, a committee, headed by the Mayor, has formed the Thomas Bailey Aldrich Memorial Association, with the following board of directors: Mayor Wallace Hackett, Alfred Gooding, E. P. Kimball, C. A. Hazlett, and Wallis D. Walker of Portsmouth; Talbot Aldrich, Prof. Charles Eliot Norton, Senator Henry Cabot Lodge, Francis Bartlett, George H. Mifflin, Col. Thomas Wentworth Higginson, George E. Woodberry, Prof. Bliss Perry, and Ferris Greenslet of Boston; Samuel L. Clemens, Edmund Clarence Stedman, Richard Watson Gilder, William Dean Howells, Edward H. Burlingame, Henry M. Alden, and F. P. Dunne of New York; H. W. Mabie of Summit, N. J.; Prof. Henry van Dyke of Princeton; Thomas Nelson Page of Washington, D. C.; and Dr. S. Weir Mitchell of Philadelphia. The association proposes to acquire by purchase the old house in Portsmouth which belonged to Mr. Aldrich's grandfather, Thomas Darling Bailey, the house in which Mr. Aldrich spent his boyhood, and which is endeared to readers of "The Story of a Bad Boy" as the "Nutter House," and to preserve it as a memorial museum. Mrs. Aldrich and Talbot Aldrich, the poet's surviving son, have agreed to deposit there his

collection of first editions, manuscripts, and autographs, together with other literary relics of interest, and have undertaken to restore the interior of the house as nearly as possible to its old-time appearance. The present representatives of the Bailey family have offered to replace in the house much of its original furnishings. It is hoped to raise by popular subscription among admirers of Mr. Aldrich the sum of $10,000 for the purchase and maintenance of the house. Contributions may be sent to the treasurer of the Thomas Bailey Aldrich Memorial Association, care of Houghton, Mifflin & Co., No. 4 Park Street, Boston.

In twenty-seventh annual report of the Peoria Public Library, the librarian, E. S. Willcox, condemns the "open shelf" system as confusing to readers. He adds:

Wherever inventories have been taken, and they are frequently shirked, the library boards are amazed at the losses by theft and by mutilation of many of their most precious volumes. Of the few who have had the courage to take an inventory, one library reported 1,000 volumes a year for four years, and went back to the old way. The Boston Public Library reported in 1905 a loss of 1,693 volumes in one year; the Providence Public Library the same year, 1,796; the Los Angeles Public Library, 4,044 a year for two years, and 2,988 the last year reported. They are at their wits' end. They begin to realize that the open shelf is only another word for self-slaughter.

A GOOD INTRODUCTORY HISTORY.

An Introductory History of England, from Henry VII. to the Restoration. By C. R. L. Fletcher. London: John Murray.

Mr. Fletcher's work has but two defects. That any candid critic except himself would have described his style as "crabbed, tortuous, and elliptic English," we doubt; but there is a real danger that Mr. Fletcher, though writing with attractive vigor and spirit, should too often indulge in allusiveness. Young people, even the cleverest, are ignorant. No teacher should ever presume that they will catch an out-of-the-way allusion. Then, too, if they are children worth writing for, they like to be told a tale with directness and plainness. Mr. Fletcher, we admit, has to meet an inevitable difficulty: he has got so much to tell, and his mind is so filled with his subject, that he naturally longs to press as much into his pages as he can. He hates therefore to waste words, but he must sedulously avoid the temptation to make use of allusive compression. In the next place, there exists a possibility that our author may fail, as most of us do, to see exactly where his own strength lies. It is to be found not precisely in picturesqueness, though his words are often full of life. It does not lie exactly in philosophic generalization, though his thoughts are always worth attention and frequently pregnant and luminous. It consists in the gift, for which it is hard to find the right name, of bringing into view and at the same time of illustrating, in the strict sense of that much-abused word, the features of a given time or situation. This natural eye for important facts is the rare talent on which he safely may, and ought to, rely. It is an endowment of special worth to a teacher who can command an audience of ingenuous and intelligent youths. How excellent is Mr. Fletcher's workmanship when he gives full play to his peculiar power will be appreciated by any one who notes the skill with which our author sums up and displays to his readers the salient features of a given political crisis. Let us examine, for instance, the few pages—they are not more than thirteen or fourteen—in which he describes the condition of things under which Charles I. opened the civil war.

The first fact to be noted, and one of the most important, is that England, towards the middle of the seventeenth century, was physically, so to speak, a different England from the country inhabited by modern Englishmen:

It was a far more open country than it is at the present day. The Tudor enclosures had affected perhaps one-third of the southern, eastern, and midland counties. The rest of the cultivated land still lay in hedgeless, open fields; and far more than half of the whole acreage was still moorland, down, marsh, or wood.

This, it will be said, is obvious. So be it, though things which are obvious are constantly forgotten. But then this obvious fact leads in the hands of a true historian to weighty conclusions. Almost all the traffic of the country was sea-borne. It was in one sense a country through which it was difficult to move about, yet the contending armies occasionally moved at an astounding pace:

The explanation probably is that horses (not forage) were cheap and abundant, and munitions of war, and even cannons, very light. Cavalry was the main branch of the service, and in an open country cavalry can move anywhere; even in the enclosed country the scanty hedges were not very formidable to a race of ἱππόδαμοι.

A physical fact affects, then, the whole mode of fighting; and with this consideration must be linked a second fact, namely, that the mechanism of modern warfare had, as Mr. Fletcher convincingly shows us, been in the middle of the seventeenth century but imperfectly developed. The pikeman was still forced to use a two-foot blade on a sixteen-foot ash staff. He wore a half-cuirass of steel, and on his head a steel cap on a leather foundation; he carried a sword, which was seldom used, girt to his side. One comes to wonder as one reads these and other details as to the pikeman's armor, how he ever marched at all. The position of the musketeer who had no defensive armor, and in case of a charge by the enemy had to fall back behind his brother pikemen for defence, was little if at all better than that of his defender. The mode of loading and firing his gun was so awkward that if you had the calamity to be a musketeer "you often blew up yourself and your front-rank man with the powder and match with which you were laden." We must omit many of Mr. Fletcher's details, but we must bear in mind his general statement that "what we call the scientific branches of the service, engineers and artillery, were wofully behind; the war was fought under such conditions that of entrenching there was virtually none." The moment that these and the like characteristics of warfare in the seventeenth century are impressed on the reader's mind, he begins to understand what must often have perplexed him: how it came to pass that cavalry was to be the deciding arm of the war.

If the physical condition of the country and the imperfect development of the machinery of war count for much, Mr. Fletcher makes clear the importance of another circumstance which often escapes the attention of even intelligent students. The population of England was both in numbers, in distribution, and in character, completely different from the 32,000,000 or so which crowd, if they do not overcrowd, the England of to-day. At the beginning of the Civil War, the people of England may "have been between four and five millions, of whom all but a million would be persons engaged in agriculture. Of that remaining million, London would account for three-eighths. During the war its population increased rapidly, if for no other reason, just because it was the safest place. . . . Norwich and Bristol may have held 50,000 between them; the small manufacturing towns of the eastern counties, of Somerset and the West Riding of Yorkshire, another 50,000. Not much is left for the other towns." England, in short, was an agricultural country, in which were scattered up and down two or three large towns, and not, as now, a land of cities separated here and there by stretches of country. Englishmen were squires, yeomen, and farmers; they were not for the most part merchants, manufacturers, shopkeepers, and artisans. Yet in this country of agriculturalists London, with less than a million inhabitants, exercised far greater power than does the London of to-day, with its population of from four to five million.

Add to all this that "the activity and intelligence of all except the lowest class was probably never greater at any period of English history," and one sees at once that the English Civil War of the seventeenth century was a phenomenon totally different from almost any other armed conflict among citizens with which the world was then acquainted. The nearest historical parallels in subsequent days are presented by the War of the Swiss Sonderbund and the War of Secession. All of these three civil conflicts present at least three points of similarity. They were each fought out between civilians, who were turned into soldiers of conspicuous bravery and efficiency from the necessity of deciding by the use of force a political issue which could not be determined by any other method. In each war, though in different degrees, men who had been trained in country life played a great part. In each war victory at last fell to the party which commanded the largest physical resources. Nor need any moralist sigh over this result. The power of material wealth—to keep the mind fixed upon the English Civil War—represented on the whole the thought, the energy, the intelligence, even in a sense the religious earnestness, no less than the mercantile resources of England. How this should be so must be learned from a study of Mr. Fletcher's pages and the books, such as S. R. Gardiner's History, which he encourages his pupils to read.

The aim of a reviewer must be to insist that our author brings into light, with the utmost skill and in a way which will impress youthful readers, the true conditions which govern the course of the contest between Parliament and Crown, and shows more distinctly than almost any writer with whom we are acquainted how from these conditions flowed two marked characteristics of the conflict between Roundheads

and Cavaliers. The first is that the war was carried on with conspicuous humanity, and this, as Mr. Fletcher points out, is the more remarkable because such trained soldiers as served on either side had been trained amid, and, one might have feared, corrupted by, the reckless barbarism of the Thirty Years' War. That this humanity was in part due to the moral earnestness of the leaders and soldiers on both sides one may well believe. It was also in part attributable to the absence of foreign intervention. Wherever foreigners, or men whom Englishmen deemed foreigners, took part in the contest, Englishmen began to show the savagery natural to civil conflict. The second characteristic closely allied to the first is that neither party could claim any monopoly of patriotism or righteousness. We are most thankful to Mr. Fletcher for having made this fact as plain as day. It is very rare for an author who feels with so much vehemence to write with so much fairness:

> We may well be very proud of our ancestors on either side in the great civil war. Never was a war undertaken more soberly, more seriously, or with greater regret; never was peace more ardently desired by the best elements on each side; never were higher ideals upheld, and never by more religious and righteous soldiers.

CURRENT FICTION.

The Lone Star. By Eugene P. Lyle, jr. New York: Doubleday, Page & Co.

Mr. Lyle has chosen to open his novel with a few pages of rather aggressive smartness; but once in motion, he flings aside spangles and rides gallantly to the close. His tale is a captivating one. The history of the making of Texas has not often been told in story, and it is a thrilling subject. The writer's enthusiasm for the early Texan heroes gives his pages a personal warmth which possibly the casual reader never expected to feel for Stephen Austin, for Sam Houston, or for Jim Bowie. These loom large, yet come very close in a tale that begins with the Mexican exclusion of Americans and ends with the battle of San Jacinto. The brawls, the battles, the divided policies, "the personal equation between race and race," form a drama of stern, often terrible, interest. Over against the pioneer figures stands that of Santa Ana in no glorious light. "A more distracting riddle in the way of a Latin-American has never, to my knowledge, toyed with the destinies of his country. To try to explain him is vexation."

Young Harry Ripley, who tells the story, is satisfyingly differentiated from the usual autobiographic hero of fiction by his human weaknesses. He is morally brave, and physically as well when nobility constrains him. He figures as blunderer and sometimes as dupe, but always retrieves himself by candor and a high courage. And so, like all the characters in the book, we find him a most lovable boy. The "little Catamou't" heroine plays her part attractively, and not too conventionally. But the Texan struggle for existence is the pith of the book, and the interesting thing is to find it made into dignified fiction, and not into the blustering "cowboyism" of a Wild West Show. Not that there is any lack of cowboyism or of horrors, but they form a contributory part, and not the essence of an historical record, good for young and old Americans.

Barbary Sheep. By Robert Hichens. New York: Harper & Brothers.

Admirers of Mr. Hichens will perhaps be disappointed to find so little actual reading matter between the covers of this fair-sized volume. A somewhat slender rill of text flows between the decorated borders, and the paper is of the thickest. One's attention is almost diverted from the fact that Mr. Hichens has at last told his tale with compactness and restraint. It is the old tale of East and West, white love and brown love, circumstance and the desert. This writer has the art of being erotic, even neurotic, without offending the ordinary reader; his taint, if taint there be, concealing itself beneath a rosy and perfumed cloud of sentiment, after a fashion rather Gallic than English. Maupassant might have told this story—only he would not have begged the question. The woman is a pretty, spoiled young English wife, who lives only to be amused, yet quickly tires of any given form of amusement. The inevitable two men are her husband, complaisant and dull, a hunting beef-eater; and an Arab of European education, now a *spahi* in the French army. A sudden whim of the woman to see the desert brings the English pair to Algiers, and to a little inn on the very edge of the waste. Here the husband, who is not in the least impressed with the desert, discovers that there are Barbary sheep to be potted; and here, while he pots them, the *spahi* turns up. Well, nothing much happens, though great preparations are made; and with the reduction of our romantic son of the desert to a mere thief, the whole affair comes rather lamely to an end. To be frank, the story is marked by that species of emotional impotence which has been noticeable in so much of Mr. Hichens's work. As for the style and proportions of the narrative, they suggest, we have hinted, a distinct advance in the art of the novelist. The purple passages of description are few and not over-long; and there is a general abstention from "piling on the agony."

Lonewood Corner. By John Halsham. New York: E. P. Dutton & Co.

One of the marvels of English rustic life lies in the rich material it still affords, after such reapers as Walton, Borrow, Jeffries, Hardy, and the whole host of outdoor chroniclers have loved and described its mind and aspect. A poorer field would offer scant reward to the most patient gleaner. In dealing with this life, "Lonewood Corner" arrives at a certain charm from its impregnation with the quality—so grateful to some palates—of being unutterably, deeply English. The author respects tradition; he enjoys looking back. It is highly characteristic that he despises Marcus Aurelius ("Stodge" is the epithet he applies) as "one of those people who can only think of infinity in one direction, as if it didn't go both ways, behind as well as in front." He treasures ancient words, ancient methods of husbandry. Modern education fills him with darkest forebodings. Perhaps his happiest moment is when Dempster, the village schoolmaster, London bred and trained, gives "nature study" lessons to his youthful hinds, and is, himself, unable to identify a cockchafer. And as for the government, "all the Virgilian plagues," he asserts, "the blights and weeds and birds and weather, one can face with a stout courage, but let a man begin to see behind the primordial contest the new odds of legislative interferences, municipal smoke-plagues, economic weed plagues and bird plagues, and it may go near to break his heart."

His friend, the Warden (who, like Trollope's, lives in an almshouse for ancient bedesmen), feels more hopeful:

> We are getting out of the frozen slush of science by degrees; . . . when we are tired of splitting up the atom we may get back to the real mysteries—such as humor, for instance, and the thing we call vulgarity.

The analysis of humor occupies the author greatly. It is, he thinks, "the admission of the incalculable, something elastic in the brain which will stand the shock when two and two don't make four." Much pleasant speculation of this nature blends with pictures of his quiet hamlet in all weathers, with slight touches of rustic character and quotations ranging as far afield as from Plato to Cobbett, and with a steady allegiance to Montaigne, in whom he finds constant comfort for the shortcomings of the modern world.

Under the Pompadour. By E. W. Jennings. New York: Brentano's.

When a romance begins with an eighteenth century smuggling misadventure on the south coast of England, the normal reader prepares to settle back on ground made comfortably familiar in a hundred novels. But there is no settling back for him till this book is closed. Though many such stories have been full of events, this outstrips them all. The hero, who runs away to avoid seeing his family disgraced, has no space to breathe, how short soever, till in the last chapter he comes home again, chased to the penultimate by his ultimately vanquished or vanished foes. On his first flight to London he naturally encounters pistols and a lady, and it is hard to say whether his friendships or his enmities bring him into more exciting situations. His brief career in London is a picture of the city's life. The French and the English Jacobites are plotting together. Gambling and duelling are the industries of the day. At a rout may be met Selwyn, Walpole, Lord Chesterfield. In Fleet Street one may see Dr. Johnson and Reynolds. The "Fleet marriages," that enabled a bride to transfer her debts to a bridegroom, were among the amenities of the slums. It was the day when gentlemen wrote poems, minced their steps, and said "Sink me!" and "Strike me windy!"—when princes and 'prentices rubbed shoulders at Vauxhall, and sailors were carried off from Bartholomew Fair by press-gangs.

But London's experiences are but kindergarten play compared with those that await young Bradninch in Paris. The tool of designing courtiers, male and female, he is made Jacobite secretary to the Pompadour. Disguised for a love-tryst as a Jesuit priest, it is he who unwittingly made history by estranging Louis XV. from the

Dauphin. And, still making history, he overheard the conspiracy which entrusted to Damiens the attempt on the King's life. He is himself destined to the Bastille, but by a lucky mistake is sent to another prison, whence he escapes by a rope shot to him by a fair lady's arrow. He conveys to her news of his safety by a carrier pigeon, with which she has thoughtfully provided him, not forgetting a nun's costume and some luncheon. Finally, he sails back to England under fire from a pursuing vessel, a double duel occurring, on the way, while both the boats are aground on a sand bar.

This is a mere outline; it is filled in with marvels of combat, kidnapping, smuggling, besides court cabals, true love and false love, blood-letting, and treason. The plot is fairly thick, but the incidents far thicker. At times one scents the novel of manners, so detailed are the millinery and furnishings of the drama. But this is only a consistent feature of the general lavishness; for the things that happen are in due proportion to the atmosphere they happen in. Everything that had been invented down to 1757, from customs to stratagems, has been here put to use. And when all is said, if at times quite preposterously opulent in material, it is still a very entertaining, even plausible and suitably told story.

Behind the Scenes with the Mediums. By David P. Abbott. Chicago: Open Court Publishing Co.
